**Liquid Manure.**—This is a favourite manure in many districts. Scotch and English farmers, in general, endeavour to have all the liquid excrements of the stock absorbed by the straw, and carried out in the solid form. On many farms, however, far more is produced than can be absorbed by the straw. Various modes have been adopted to apply it when this is the case. It is commonly done by a large barrel drawn by a horse; the liquid is distributed by various methods as the horse walks over the ground. The liquid manure is commonly applied to grasses, more especially to clovers or rye-grass, common or Italian. As the liquid accumulates, it may be applied to the young grasses as soon as the corn crop is removed. The plants, being vigorous in autumn, absorb it, and form roots and juices that are available as soon as the growing season arrives. It may be applied during intervals of mild weather during the whole winter. It is, no doubt, most economical to apply it at the season of growth, as the roots take it up then very readily, and there is comparatively little waste from being washed out of the soil. In some large establishments, the whole urine is collected during the winter in large tanks, and applied in spring. This has been done on a large scale by means of underground pipes laid over the fields, the liquid being distributed by means of a pump and hose. Steam or water power has been in some cases applied to this operation; in others it is effected by gravitation, when the situation of standing and reservoir suits. In wet weather, the liquid manure can be put on pretty strong, but in dry weather large quantities of water are added for the purpose of diluting it, and not allowing it to injure the plants. Liquid manure is exceedingly rich in all the elements of plants, and is valuable for all crops; but there are often considerable practical difficulties connected with its use and distribution.

**MANUSCRIPTS, ILLUMINATION OF,** the art of painting manuscripts with miniatures and ornaments, an art of the most remote antiquity. The Egyptian papyri of the ritualistic class, as old as the 18th dynasty, are ornamented with vignettes or miniatures, attached to the chapters, either designed in black outlines, or painted in primary colours in tempera. Except these papyri, no other manuscripts of antiquity were, strictly speaking, illuminated; such Greek and Roman ones of the 1st c. as have reached the present day being written only. Pliny, indeed, mentions from Varro that authors had their portraits painted on their works, and mentions a biographical work, with numerous portraits introduced, but all such have disappeared in the wreck of ages; the oldest illuminated MSS. which have survived being the *Dioscorides* of Vienna, and the *Virgil* of the Vatican, both of the 4th c., and ornamented with vignettes or pictures in a Byzantine style of art. St Jerome, indeed, in the same century, complains of the abuse of the practice, as shewn by filling up books with capital letters of preposterous size; but the manuscripts of this and the subsequent century are ornamented with rubrics only, as evidenced by the *Codex Alexandrinus* and other manuscripts. Probably the art of illumination was derived from rubrics, as the emperors in the 5th c., commencing with Leo (470 A.D.), signed in this colour, like the Chinese, and this 'vermilion reply,' adopted by Charles the Bold in the 9th, continued down to the 13th century. The art of illuminating

manuscripts with gold and silver letters is supposed to have been derived from Egypt, but it is remarkable that no papyrus has any gold or silver introduced into it. The artists who painted in gold, called *Chrysographi*, are mentioned as early as the 2d century. One of the oldest manuscripts of this style is the *Codex Argenteus* of Ulphilas (360 A.D.), and the charter of King Edgar (966 A.D.), six centuries later, shews the use of these letters. Gold letters seem to have been used in the East during the 12th and 13th centuries. At an early period, the use of illuminated or decorated initial letters commenced, which is to be distinguished from the illuminated or painted pages placed at the head of Byzantine manuscripts. Originally, they were not larger than the text, or more coloured; but the Syriac manuscripts of the 7th c. have them with a pattern or border; and they go on increasing in size and splendour from the 8th to the 11th c., when large initial letters, sometimes decorated with little pictures or miniatures, came into fashion in the Greek and Latin manuscripts. The subjects of the figures mixed up with the Arabesque ornaments often referred to the texts; warriors and warlike groups of figures being introduced when the text referred to war; symbolical representations of hell, where the chapters following treated on that region. These initial letters soon increased to a great size, being from 2 to 24 inches long; they were most used in the 8th and 9th centuries, but continued till the 12th c., and degenerated in the 16th to the last decadence of art—the grotesque. The art which flourished in the Eastern and Western Empires passed over to Ireland, and there gave rise to a separate school or kind of illumination. This style, which consists in a regular series of interlaced ribbon ornaments, often terminating in the heads of gryphs and other animals, seems to have been derived from the later patterns of Byzantine art, seen on mosaics, mural paintings, and other objects. Some, indeed, have thought that they are of oriental origin. The so-called Durham Book, in the British Museum, of the 8th c. is a splendid example of the school which was established in Holy Island by St Aidan, and in Kent by St Dunstan, before the end of the 6th century. Another remarkable MS. of this age is the Book of St Kells, at Dublin. The Scriptorium of the monastery at Hyde, near Winchester, was celebrated at this period for its illuminations; and the celebrated St Dunstan of Glastonbury applied in early youth his talents to this art. The minute size and number of interlacings of the *Book of St Kells*, at Dublin, is quite wonderful; while the *Benedictional* of Chatsworth, executed by one Godemann of Hyde for Ethelwold, Bishop of Winchester (1100 A.D.), exhibits a bold style of art and ornament. Separate schools prevailed in the 11th c., the Greek or Byzantine manuscripts of the period exhibiting a fine style of ornament derived from the Byzantine school; while the Latin manuscripts of the period are distinguished by the use of a light blue and green in titles and pictures. While, however, the ornaments of the Byzantine and Latin schools were of a more purely architectural character, and the Anglo-Hibernian, Saxon, and even Franco-Gallic manuscripts of Charlemagne and his successors exhibit a union of Roman and Gaulish treatment; a new kind of work arose in the 10th c. in England, called the *Opus Anglicanum*, resembling more in character the ornaments of Gothic architecture, a remarkable specimen of which is seen in the Gospels made for Knut or Canute. During the 12th c., there arose a new style, distinguished by the profusion of its ornamentation, intricate mode of illumination, and abundant use of gold and silver. The taste was false, but the art

had become more special, blank spaces being left for the limners to fill in. In the 13th c., the art still more deteriorated in Western Europe—long-tailed illuminated initial letters were introduced; the background was often of gold, on which the ornaments and subjects were coloured in a style resembling oil-painting, from 1190 to 1230; manuals were then prepared to instruct the limner, and the art was formalised. The Gothic style of ornament of this age had superseded the Roman or Byzantine of previous centuries. In the 14th c., the art greatly improved; the border or ornament running all round the page was introduced, and the ornaments were interpolated and enriched with miniature pictures, even by celebrated artists, as Niccolò Pisano, Cimabue, Giotto, in Italy. Few volumes, however, were illuminated till after the reign of Edward I., when the art took a further development; grotesque figures were introduced, and are alluded to by writers of the period. In the 15th c., continuous borders and fine miniature pictures were in use, and towards the end of the century, celebrated works of this nature were produced by Giulio Clovio in Italy, and Lucas van Leyden in Flanders, the Van Eycks, and Memling or Hemlink; medallions of exquisite style and finish were inserted in the border. Of this age, the most beautiful known specimen is the *Book of Hours* of Anne of Brittany, wife of Louis XII., with borders of natural plants on a gold ground. The Italian art of the same age was symmetrical rather than picturesque and naturalistic, but on solid backgrounds; the ornaments, although resembling those of preceding centuries, are distinguished by the introduction of miniatures. In the 16th century, in the reign of Louis XIV., the art became extinct, ending with a style of painting called *encre gris*, a kind of monochrome, in which the lights are white or gold, and shaded so as to emulate bas-reliefs. Among oriental nations, the Persians, Hindus, and Chinese have illuminated manuscripts of great beauty, none of which, however, can compete with those of the Western nations in antiquity. For beauty of design, some of the Arab manuscripts are charming, but their antiquity does not reach beyond the 13th century. The Chinese Buddhists have also illuminated classics, or religious books of their sect, one of which, the *Diamond Book* as it is called, in the British Museum, has a text splendidly printed in silver and gold letters on a blue ground; and the vignettes charmingly painted in tempera, on macerated leaves of the *Ficus Indica*.

Humphrey, H. Noel, *Art of Illumination* (12mo, Lond. 1849); Shaw's *Illuminated Letters* (fol. 1828); Bradley, J. W., *Manual of Illumination* (12mo, Lond. 1860).

**MANUTIUS**, **ALDO** (*Aldo*, a diminutive of *Theobaldo*, his baptismal name), a great printer and improver of the art of printing. His name, in its Italian form, is spelled in three different ways by himself or his descendants, viz. Manuzio, Manuzzi, and Manucci; while from his patron, Alberto Pio, Lord of Carpi, he took also the name of Pio, and, after the year 1503, always designates himself Aldo Pio Manutio Romano. He is often called *Aldus the Elder*. He was born at Bassiano, near Velletri, in the States of the Church, in 1449, and established a printing-press at Venice in 1490 (though the first book bearing a date has 1494), from which many works were issued (see **ALDINE EDITIONS**). He died 1515.

**MANZONI**, **ALESSANDRO**, one of the most admired of modern Italian novelists, was born at Milan in 1784, of noble parents, his father being Count Manzoni, and his mother the gifted daughter of the great savant, the Marquis Beccaria. From

youth, the literary predilections of M. gave promise of his after-mental development. In 18 at the age of 21, his essay on poetry, entitled *Veri Scioliti*, was inspired by the death of Carlo Imbonati, an intimate family friend; and in 1810 his sacred lyrics met with general admiration. Several tragedies, written with much spirit and originality, attracted notice not only in Italy, but in France and Germany; and foremost amid the warm admirers and favourable critics of M. stood Goethe. The work, however, by which M. attained to European fame is his historical novel, *I Promessi Sposi*—a Milanese story of the 17th c., translated into German, English, French, and other tongues—(3 vols. Milan, 1827), by which a new era may be said to have been created in the fictitious literature of his country. The tale abounds in interesting sketches of national and local Italian customs and modes of life, portrayed with unflagging spirit and humour, while various grave historical events are narrated with force and grandeur of style, especially the episode of the plague in Milan. M.'s ode to Napoleon (1823) is noble in thought and diction. The poet's later years were spent in strict and devout seclusion, the free tendency of his early opinions having been succeeded by a stringent conformity to the doctrines of Rome. A complete edition of M.'s works, in 5 vols., was published by Tommaseo in Florence (1828—1829). He died in 1873.

**MAOR**, the royal official who, in the early periods of Scottish history, was placed over crown or fiscal lands, and at an after-time became the Thane. A similar official, the Maer, existed in Wales.

**MAORIS** (a New Zealand word signifying *native* or *indigenous*) is the name given to themselves by the inhabitants of New Zealand, and that by which they are now usually designated by ethnologists. The M., in common with the natives generally of Polynesia, belong to the Malay race or family of mankind. Though calling themselves indigenous, the M. have a tradition that their ancestors migrated to the present seat of the nation from the island of Hawaiki about 500 years ago. They came in seven canoes, which had outriggers, to prevent foundering, and were called Amatiatia, being very different from those subsequently used by them, which were much simpler in construction, and named Wakka. The first of these canoes that touched at New Zealand was named Arawa, and this brought over the first settlers from whom the M. are descended. If any faith is to be attached to this tradition, Hawaiki was, probably, the same as Hawaii, the principal of the Sandwich Islands, distant about 4000 miles north-east of New Zealand. Some, however, suppose that it may have been Savaii, one of the Samoan or Navigators' Islands, a group not half that distance away. The tradition says nothing of any indigenous population found in New Zealand before the arrival of these immigrants. Many writers, however, incline to the belief that it was previously inhabited by a darker race, somewhat akin to the Papuas of New Guinea, sometimes called Negritos and Pelagian negroes. Supposing that the two races, in process of time, intermingled, this might account, in some measure, for the differences apparent between the M. and the Tahitians, Samoans, Sandwich Islanders, and other natives of the Pacific. But whether of pure or mixed race, all testimony combines in representing the M. as a nation standing very high in the scale of humanity. The skin of the Maori is in general of an olive-brown colour, but there are some in whom the shade is much lighter, while in others it is darker. In stature they almost equal Englishmen, and have a powerful muscular development. They have well-shaped, intellectual heads,

# MAORMOR—MAP.

—eir features, when not tattooed, might almost be taken for European. Few of them have beards or whiskers, it being an immemorial custom with them to pluck out the hair on the face with pipi-bells. On the head, the majority have long black hair, with a slight wave in it; but with some it is of a reddish tinge, and some M. again have the hair slightly frizzled. Their eyes are large, their lips thick, and their teeth, unlike those of most savage nations, are large and irregular. The women are of less stature than the men in proportion, and are in other respects inferior to them, perhaps from their marrying too young, and having to perform too much of the drudgery of life. Some of the women, however, are represented as being delicately moulded, with long eyelashes, pleasing features, and a plaintive, pathetic voice, which makes them highly interesting. Both sexes used to practise tattooing, a custom which has been almost abandoned since the conversion of the M. to Christianity. It was a painful operation, performed with a hammer and saw-like chisel. The punctures were stained with vegetable dyes, and the patterns, which extended over the face, hips, thighs, &c., represented ornamental scrolls and figures, supposed to denote the rank of the individual wearing them. The women were but slightly tattooed, with a few lines on the lips, chin, and occasionally other parts of the body. The priests were the principal operators, and during the process, ancient songs were sung, to encourage, divert the attention, and increase the patience of the sufferers. This tattooing was supposed to make the Maori youth both more terrible in the eyes of his enemies, and more acceptable in those of his mistress. Another remarkable custom among the M. was that of the *taboo*, by which the priest could make certain persons and things sacred and inviolate. This was partly a religious and partly a political ordinance, and was so much respected, that even in war-time hostile tribes left unharmed all persons and things thus protected by the *taboo* of the opposite side. Cannibalism, a much more heinous and abominable custom, practised so lately as within the last forty years, was universally prevalent among the M. before their conversion to Christianity. The last instance of it occurred in the year 1843. 'Now, however,' says Dr Scherzer (*Voyage of the Novara*), 'any allusion to this revolting practice is very painful to the New Zealander, as reminding him of his former low position in the scale of nations. Every time that we endeavoured to make any inquiry of the natives respecting this custom, they withdrew with an ashamed look. In like manner, dogs' flesh has ceased to be an article of food, ever since the introduction of pork by Captain Cook. Formerly, the native or Maori dog, which at present is very scarce, was eaten on certain occasions, while its blood played a somewhat conspicuous part in Maori pharmacy.' Infanticide, which also prevailed largely among them in their days of heathenism, is now universally abolished, and the same is the case with slavery and polygamy. The M. generally marry very young, and instances are known of females among them becoming mothers even at the tender age of eleven years. Their marriages, however, are not very productive, three in a family being considered a good average, and many of these dying in their first year. It is difficult to account for this, seeing that the M. of the present day are not addicted to intemperance, like other half-civilised tribes. The wars of the M. were formerly carried on with spears and clubs of various kinds, manufactured from stone and wood. Their most remarkable weapon was a spear of nephrite, which descended among the principal chiefs from father

to son, and was regarded as a kind of sceptre, and even a sacred object. It was called *Merimori*, 'the fire of the gods,' and was sometimes used for scalping prisoners. There are other weapons of nephrite in use among the M.; they are much sought after, and very costly. The use of firearms is now, however, very general among the M., and that they are adroit marksmen has been made but too apparent in their contests with English troops. The language of the M., like the Polynesian languages generally, belongs to the Malay family. Its alphabet comprises only fourteen letters, viz. A, E, H, I, K, M, N, O, P, R, T, U, W, and Ng. Seven tolerably distinct dialects are spoken among them. The language is represented as rich and sonorous, well adapted for poetical expression, especially of the lyric kind. The M. have an abundance of metrical proverbs, legends, and traditions, of which a collection has been made by Sir George Grey. They are also passionately attached to music and song. More than five-sixths of the M. are now converted to Christianity. Of these, such as live within the English settlements are becoming gradually assimilated to our own colonists, for the most part wearing the European dress, &c., while those further removed are content with the blanket, which has come to supersede the native cloth. They generally practise agriculture, but will not work very hard. They are good sailors and fishermen, and, indeed, more than a hundred coasting-vessels of a good size are now the property of natives. The M., however, as a nation, although ready to imitate our manners and customs, are not quite contented with our colonial rule, and have frequently raised the standard of revolt against Britain under their native chieftains. In 1861, hostilities commenced between the M. and the British, which terminated in favour of the latter the following year. In 1863, war broke out again, the M. having conspired to expel the British troops. In 1868, they massacred many of the settlers, and resisted, to desperation, the troops sent to quell them—a feat accomplished the following year. Pop. (1868) only 38,548.

**MAORMOR**, the old equivalent of the earl in Scotland, an official similar to a Maor (q. v.), but placed over a province instead of a thanage, an earldom or county instead of a barony, exercising the office of royal deputy or steward over the territory of which he had at a still earlier period been the independent lord, and probably retaining to himself the third part of the royal revenues and prerogatives. Prior to the introduction of feudalism, Scotland seems in theory to have been subdivided into maormordoms, each made up of the maormor's portion and the king's, in later language, the earldom and the regality, over both of which the maormor exercised his office, though the former was, in a special sense, his own. Practically, however, in certain of these districts the king retained both maormordom and regality in his own hands, and the maors held their thanages directly of the sovereign, without the intervention of a maormor. As the feudal system extended, the maormors were converted into earls, who were confined within the limits of their own districts, the Earl of Fife alone retaining the privilege of exacting his rights over the whole province.

**MAP** (Lat. *mappa*, a towel). A map is a delineation, on a plane, of some portion of the surface of a sphere, celestial or terrestrial, on which the objects intended to be shewn are traced, whether stars or towns, mountains, &c. Terrestrial maps are termed *geographical*, when they refer to the land; and *hydrographical* maps, or *charts*, when they delineate the shores of the sea. A perfect representation of a

## MAP.

with all its parts in true proportions and positions, may be made on a globe; but, the surface of the earth is spherical, it is impossible so to delineate any large portion of it as to retain these properties. Hence we resort to different methods of representation called projections (q. v.), which are of two kinds—either real perspectives from different points or approximative developments. The five principal projections are—the orthographic, the cylindrical, the globular, the conical, and the Mercator's.

The first of these, the flat surface on which the map is drawn is supposed to pass through the centre of the earth, and, according to the distance of the projection is either of the first, second, or third. In the *orthographic*, the eye is assumed at an infinite distance from the centre of the earth, so that all rays of light proceeding from every point on its surface are parallel and perpendicular.

In the nature of this projection, it is evident that the central parts of the hemisphere are accurately represented, towards the circumference the countries are crowded together and distorted in size. On this account it is of little geographical value, though of considerable value for astronomical purposes. In the *stereographic*, the point of projection is assumed to be placed on the surface of the sphere opposite the one to be projected. If the globe were transparent, the observer would then see the opposite concave surface. In the *orthographic*, this method contracts the circumference of the map, and enlarges it towards the centre. Owing to the unequal area of the hemisphere, and the difficulty of finding the true latitude and longitude of places, this projection is not much employed. In order to rectify the effects of the two preceding, the globular projection, a modification of the two, is generally used.

If we suppose the eye to be removed to a distance equal to the sine of the radius of the circumscribing circle, the projection will be globular. In other words, if the diameter of the sphere be 200 parts, it must be produced to 200 sine parts, in order to give the point of projection.

In this projection the meridians and parallels are represented by elliptical curves, but as they approach so closely to being circular arcs, they are very rarely distinguished otherwise.

Fig. 1.—Globular, or Equidistant Projection of a Hemisphere.

The construction of the globular or equidistant map is as follows (fig. 1): Describe a circle

NESW, to represent a meridian, and draw two diameters, NCS and WCE, perpendicular to each other, the one for a central meridian, the other for the equator. Then N and S will represent the North and South poles. Divide each of the quadrants into 9 equal parts, and each of the radii CN, CE, and C also into 9 equal parts. Produce NS both ways, and find on it the centres of circles which will pass through the three points 80 x 80, 70 y 70, &c., and these arcs described on both sides of the equator will be the parallels of latitude. In like manner, find on WE produced, the centres of circles which must pass through a, b, c, and the poles. Having selected the first meridian, number the others successively to the east and west of it. A map in this way may be constructed on the rational horizon of any place.

The impossibility of getting a perfect representation of special parts of the sphere by any of the previous methods, led to the desire for others less defective. Of all solid bodies whose surfaces can be accurately developed or rolled out upon a plane without alteration, the cone and cylinder approach nearest to the character of the sphere. A portion of the sphere between two parallels not far distant from each other, corresponds very exactly with a like conical zone; whence it is that conical developments make the best projections for special geographical maps, and even with some modifications for large portions of the globe.

A conical projection of Europe (fig. 2) is constructed

Fig. 2.—Conical Projection of Europe.

thus: Draw a base line AB of indefinite length; bisect it in E, and at that point erect a perpendicular ED, to form the central meridian of the map. Take a space for 5° of latitude, and since Europe lies between the 35th and 75th parallels of latitude, mark off eight of these spaces along ED for the points through which the parallels must pass. The centre from which to describe the parallels will be the point in ED where the top of a cone, cutting the globe at the 45th and 65th parallels, would meet the axis of the sphere. This point will be found to be beyond the North Pole, at C. Since on the parallels of 45° and 65°, where the cone cuts the sphere, the degrees of longitude are exactly equal to those on the globe, if on these parallels distances be marked off equivalent to 5° of longitude, in proportion to the degrees of latitude in those parallels, and through these points straight lines be drawn from C, they will represent the meridians for every 5°.

Since all meridians on the globe are great circles

## MAPES—MAPLE.

passing through the poles, the north and south points at any place correspond with the poles of the earth. The east and west points, however, are indicated by a line at right angles to the meridian, and do not, except at the equator, correspond with those of the earth. In all the projections hitherto described, the direction either of the north and south, or of the east and west points, is represented by a curved line, so that on such a map the course of a vessel would almost always be laid down in a curve, which could only be described by continually laying off from the meridian a line at an angle equal to that made with the meridian by the point of the compass at which the ship was sailing. If the vessel were to steer in a direct north-east course by one of the previous projections, she would, if land did not intervene, describe a spiral round, and ultimately arrive at the North Pole; therefore, the mariner requires a chart which will enable him to steer his course by compass in straight lines only. This valuable instrument is supplied by Mercator's chart, in which all the meridians are straight lines perpendicular to the equator, and all the parallels straight lines parallel to the equator.

It is constructed as follows (fig. 3): A line AB is

Fig. 3.—Mercator's Projection.

drawn of the required length for the equator. This line is divided into 36, 24, or 18 equal parts, for meridians at 10°, 15°, or 20° apart, and the meridians are then drawn through these perpendicular to AB. From a table of meridional parts (a table of the number of minutes of a degree of longitude at the equator comprised between that and every parallel of latitude up to 89°), take the distances of the parallels and of the tropics and arctic circles from the equator, and mark them off to the north and south of it. Join these points, and the projection is made.

This projection, of course, does not and is not intended to give a natural representation of the earth, its effect being to exaggerate the polar regions immensely. The distortion in the form of countries and relative direction of places, is rectified by the degrees of latitude being made to increase proportionally to those of longitude. This is the only map which gives an unbroken view of the whole surface of the earth.

The term *map* is specially applied to representations of land, or land and water together; while that of *chart* is limited to the coast and water surface only, shewing currents, rocks, anchorage, light-houses, harbours, soundings, and other objects of importance to seamen.

A geographical map proper is a general map of

the world, or of a large extent of country. A topographical map differs from it in being limited to a small area, and much more detailed. The Ordnance map of Britain is a good example of a topographical map. Besides purely geographical and topographical maps, others are constructed for special purposes, which may be physical, political, or civil, military, statistical, historical, &c.

In order to construct a map, and to determine accurately the positions of places on it, a knowledge of two elements is essential—viz., latitude and longitude from the equator, and longitude or distance east or west of the meridian adopted.

Every map, whatever its dimensions, is in definite relation to the actual size of the globe. This relation is indicated by a scale—a graphical line shewing, by its divisions, the number of miles corresponding to any space measured on the globe. The scales of geographical maps range from 800 miles to an inch (for maps of quarters of a globe) to 10 miles to an inch; those of topographical maps range from 1 inch to 25 miles to a mile, the largest topographical maps admitting of the most minute details.

The Ordnance Survey of Great Britain is on a scale of  $\frac{1}{250,000}$  of nature, or one inch of paper represents a mile of surface.

A recent improvement introduced into the printing of maps, is that of printing the water-courses in ink, making the orography and skeleton of the country stand out in clear relief, thus avoiding confusion resulting from all the lines being blue in older maps.

MAPES, or MAP, WALTER, a famous medieval writer of Latin verse, called by Lord Lytton 'the Anacreon of the 12th century,' was born where on the frontiers of Wales (probably Herefordshire) before 1150. He studied at Paris, and on his return to England found entrance to the court of Henry II., and became a favourite with Henry II., and was Archdeacon of Oxford in 1196, after which he does not again appear in history. He is thought to have died about 1210. M.'s best known piece is a drinking-song, beginning

Meum est propositum in taberna mori,

which has been charmingly rendered into English by Leigh Hunt. It is part of a longer poem called *Confessio Goliae*. Considerable doubt, however, is now felt as to the proper authorship of the poem, commonly attributed to M.; and Mr Wright has edited them for the Camden Society (1844), and brings forward several reasons for concluding that the author must be a different person from M. The most weighty of these reasons is, that Gilius Cambrensis, the intimate friend of the archbishop, severely censures the poems that went under the name of Goliae, of which the famous drinking-song was one, while in the same breath he warmly praises Mapes. It is certain, however, to explain it may, that soon after the time of the archbishop they were regarded as his, and his name is inscribed on them in MSS. of the 14th and 15th century. He also wrote several prose works in Latin and French.

MAPLE (*Acer*), a genus of exogenous trees, in the natural order *Aceraceae*. This order contains more than sixty species, natives of the temperate parts of the northern hemisphere, and particularly numerous in North America and the north of Europe. They have opposite leaves without stipules, usually lobed or palmate. The flowers are in axillary corymbs or racemes, small, but abounding in nectar, and very attractive to bees. The calyx is generally divided into five segments; the petals, when present,

## MAQUI—MARAJO.

equal in number to the segments of the calyx, grow from the margin of a fleshy, hypogynous disk. The fruit is formed of two small winged nuts, each with one or two seeds. With few exceptions, the genus *Acer* includes the whole order.—The COMMON M. (*A. campestre*), a small tree, is a native of Britain, and of many parts of Europe and Asia. The leaves are small, and usually five-lobed; the wood is compact, fine-grained, takes a high polish, and is much used by turners and for carved work. Several nearly allied species are found in the south of Europe.—The STRIPED BARK M. (*A. striatum*) of North America, where it often forms great part of the undergrowth in woods, is remarkable for longitudinal black and white stripes on its bark; and its wood, which is very white, is used for inlaying in cabinet-work.—The GREATER M. or SYCAMORE (*A. pseudo-platanus*), commonly called *Plane-tree* in Scotland, is a native of various parts of Europe, but a doubtful native of Britain, in which, however, it has long been common. It attains a height of 70–90 feet, has a spreading umbrageous head, and large, palmate, coarsely serrated leaves on long stalks. It is of quick growth, and succeeds well near the sea, and in other exposed situations. The wood is white, compact, and firm; not hard, but capable of a fine polish; and is used by wheelwrights, turners, &c. It is not apt to warp. Stair-rails are often made of it, and pattern-blocks for manufactures, as well as bowls, bread-plates, &c. Sugar is sometimes made from the sap of this tree, as from that of several other maples; but the species which yields it most abundantly is the SUGAR M. (*A. saccharinum*) of North America, a species which much resembles the sycamore, and abounds in the northern parts of the United States and in the British possessions, where large quantities of sugar are made from it, although only for domestic use. The trunk of the Sugar M. is generally more slender than that of the sycamore. To obtain sugar, holes are bored in the trunk when the sap is ascending, early in spring, before the winter frost has passed away, in an obliquely ascending direction, at no great distance from the ground, at first only to the depth of half an inch, but afterwards deepened to two inches; and the sap thus collected is evaporated in boilers over a brisk fire, to the consistency of sirup, strained and poured into moulds, in which it crystallises into a coarse gray or brown coloured sugar. It is sometimes afterwards refined. Four gallons of sap yield about one pound of sugar. A single tree yields from two to six pounds in a season. During the sugar-making season, sheds are erected in the woods for the boiling and other processes of the manufacture. The sap cannot be kept long after being collected. Good vinegar is made from it, and a kind of molasses much superior to that from the sugar-cane, and much used in America with buckwheat cakes, &c. The wood of the Sugar M. has a satiny appearance, and is used for cabinet-making; it is sometimes finely marked with undulations of fibre, and is then known as *Bird's-eye M.*, and is used for veneers. The cultivation of the Sugar M. in Europe, for the sake of its sugar, has of late been much advocated. It is not so hardy in the climate of Britain as the sycamore, and seems to require a dry and sheltered situation.—The NORWAY M. (*A. platanoides*) is a native of the north of Europe, although not of Britain, and is also found in North America. It much resembles the sycamore, and its wood is used for the same purposes. It is pretty common in plantations in Britain.—A Himalayan species (*A. nilssonii*), a noble tree, found with pines and birches at great elevations, has recently been introduced into Britain.

MAQUI (*Aristotelia Maqui*), the only known species of a genus of plants sometimes referred to the natural order *Tiliaceae*, and which has also been made the type of a proposed order. It is an evergreen or sub-evergreen shrub, of considerable size, a native of Chili. The flowers are small, green, and yellow, in axillary racemes of no great beauty. The fruit is a three-celled berry, about the size of a pea, black, acid, and eatable; the Chilians make a wine from it. The wood is used for making musical instruments, and the tough bark for their strings. The M. sometimes ripens fruit against a wall in England, and is frequently cultivated as an ornamental shrub.

MA'RABOU FEATHERS. See ADJUTANT.

MA'RABUTS, a name given to the descendants of the *Moravides* (Arab. frontier inhabitants), a certain Arabic tribe, which, in 1075, founded a dynasty in the north-western parts of Africa, and held Morocco and Spain for a considerable period. The Almohads having put an end to their temporal dominion, their descendants exercise to this day a kind of spiritual superiority over the Moslem negroes in Barbary, the coast of Guinea, &c. They form a kind of priestly order, officiating at mosques and chapels, explaining the Koran, providing the faithful with amulets, prophesying, and working miracles. They are looked up to with great awe and reverence by the common populace, who also allow them a certain vague licence over their goods and chattels—their wives not excluded. The Great Marabut ranks next to the king, and the dignity of a Marabut is generally hereditary. One of the most eminent M. of our day was the late Abd-el-Kader (q. v.).

MARACAY'BO, a fortified city of the South American republic of Venezuela, is situated on a sandy plain on the west shore of the strait which connects the lake of Maracaybo with the gulf of the same name. Lat. 10° 45' N., long. 71° 40' W. It is the chief town of a province of the same name, comprising the territory surrounding the lake of Maracaybo, and containing 33,075 square miles, and a population of about 90,000. It is a handsome town, with a hot but healthy climate, and has a harbour deep enough to contain the largest vessels, but inaccessible to them, owing to the shifting bar at its mouth. In 1864, 397 vessels entered and cleared the port. The chief articles of export are cocoa, hides and skins, fustic, dividivi, the balsam of copaiba, and cotton. Pop. (1869) 20,000.

MARACAYBO, LAKE and GULF. The Lake of M., in the north of Venezuela, is about 100 miles in length, and 70 miles in breadth. It is of considerable depth, but the bar at its mouth prohibits the entrance of large vessels. It is connected with the gulf of the same name by a strait upwards of 20 miles in length, and from 5 to 10 miles in breadth. The gulf is a wide inlet of the Caribbean Sea, 150 miles from east to west, and about 75 miles from north to south.

MA'RAGHA, an old town of Persia, in the province of Azerbaijan, 50 miles south of Tabriz, on a tributary of Lake Urumiah. It is surrounded by walls, and was long the capital of the province. It contains two bridges of the 11th c., and the remains of the observatory of the celebrated medieval astronomer, Nasir Eddin. Pop. 15,000.

MARAJO', an island on the north-east coast of Brazil, belonging to the province of Para, and situated between the estuaries of the rivers Amazon and Para, is 180 miles in length by 125 miles in breadth. In the north-east, it is somewhat elevated, without trees, and covered by herds of cattle. The

western portion is low, and watered by numerous streams. Pop. estimated at 20,000.

**MARANHA'M**, or **MARANHAO**, a rich and important maritime province of the empire of Brazil, is bounded on the north by the Atlantic Ocean. Area, 141,939 square miles; pop. (1867) 385,000. The surface is uneven, but there is no range of mountains. It is quadrilateral in shape, and is watered by numerous rivers, which, falling into the Atlantic, traverse its whole length in a direction parallel with its sides. Its climate is fine, and its soil produces vast quantities of rice, for the production of which it is peculiarly fitted. Cotton, sugar-cane, and fruits are also extensively grown. Its surface is still to a great extent covered with forests; iron and lead ores and antimony have been discovered; and sheep, cattle, and horses are extensively reared.—The chief city is *Maranham*, or *San Luiz de Maranham*, the fourth in rank and importance, and the best-built city in the Brazilian empire. It is situated on an island of the same name, in lat.  $2^{\circ} 30' S.$ , long.  $44^{\circ} 18' W.$ , is remarkably clean, gay, hospitable, and prosperous, and has a population of 36,000. M. is the seat of a bishop, contains a cathedral, ten churches, several monasteries and convents, a lyceum, and other educational institutions.

**MARA'NO**, a town of the province of Naples, situated on a gentle slope four miles from Naples. Pop. 7302.

**MARANTA'CEÆ**, or **CANNACEÆ**, a natural order of endogenous plants, very nearly allied to *Scitamineæ* (q. v.), and differing chiefly in having all the stamens petal-like, and the one fertile stamen lateral. They are destitute of the aromatic property so general in the *Scitamineæ*. There are about 160 known species, all tropical or sub-tropical. They are all herbaceous perennials. Not many of them are large or notable for the beauty of their flowers. The tuberous root-stocks of many abound in starch.

**MARASCHI'NO**. See LIQUEUR.

**MARA'SMUS** is a term which was somewhat vaguely used by the older medical writers to designate those cases of general emaciation or atrophy for which they did not see any special cause. The word is now seldom used except occasionally as a synonym for *tabes mesenterica*, or tubercular disease of the mesenteric glands. See MESENTERY, MESENTERIC DISEASE.

**MARAT**, **JEAN PAUL**, one of the most infamous characters of the French Revolution, born 1744, of Protestant parents, at Baudry, in Neuchâtel. He spent some of his early years in Britain; published several treatises in London; acted as a teacher of languages in Edinburgh; and underwent punishment for stealing some valuable medals from the museum in Oxford. Afterwards returning to Paris, he practised an inferior branch of the medical profession until the Revolution brought him into prominence as a demagogue. His features and appearance were grotesque, his look wild, and his speeches extravagant, the ludicrous mingling with the terrible. His influence over the lowest classes, however, soon became great. He issued a journal, which he at first called the *Publiciste Parisien*, but afterwards the *Ami du Peuple*, which is historically connected with some of the most fearful events of that period. No falsehood was too monstrous to be published in it, no atrocity too great to be recommended. It was in a great measure the influence of M. which led to the cruelties and massacres of September 1792, in the midst of which he was elected a member of the Convention, but on his appearance there he was

received with almost universal expressions of abhorrence. No one would sit beside him, and when he attempted to speak, a tumult always arose. His journal, now the *Journal de la République*, became more ferocious and sanguinary than ever. He demanded the sacrifice of 270,000 heads, and defended this in the Convention, saying that if these were not granted, he would demand more. During the king's trial, he was urgent for his immediate execution, and in his journal called upon the people to slay 200,000 of the adherents of the old régime, and to reduce the Convention to one-fourth. In April 1793, M. obtained the enactment of the fearful law against suspected persons, in virtue of which 400,000 were imprisoned. Robespierre, Danton, and M. were now the triumvirate which ruled France. But on July 13, 1793, M. was stabbed in his own house by Charlotte Corday (q. v.). This event was followed by some of the worst atrocities of the Reign of Terror; streams of blood flowing, as was said, to the manes of M., whose likeness, with gaping wounds, painted by David, was exhibited on an altar in the Court of the Louvre, and then hung up in the Convention; whilst it was decreed that his housekeeper, whom he had married 'one fine day, in the presence of the Sun,' should be maintained at the expense of the state. A decree of 4th November 1793 gave to M.'s remains the honours of the Pantheon; but they were cast out of it again on 8th November 1795, and his picture was removed from its place in the Convention.

**MARATE'A**, an Italian town of the province of Basilicata, situated on the slope of a mountain, in the midst of a lovely and salubrious country. Pop. 6480.

**MAR'ATHON**, anciently, a village on the east coast of Attica, about 20 miles north-east of Athens, now called Marathon, or, according to Leake, the present Vrana. It was situated in a plain of the same name, about six miles in length and three in breadth, with a background of mountains in the west, and a marsh both on the north and south; eastward, it reached the sea. Byzantine lines in the *Isles of Greece* correctly describe it:

The mountains look on Marathon—  
And Marathon looks on the sea.

It is gloriously memorable as the scene of the grand defeat of the Persian hordes of Darius by the Greeks under Miltiades (490 B.C.).

**MARAUDING** (a word, common under orthographic variations, to most of the European languages, and, probably, of identical root with the verb 'to mar') is irregular plunder or violence offered to the inhabitants of a country by the individuals of an army. In all armies where discipline is maintained, marauding is, at least professedly, punished by death; the provost-marshal having power to inflict that penalty summarily on all offenders taken in the act.

**MARAVE'DI**, an old Spanish coin, either of vellon, worth about  $\frac{3}{4}$ ths of a farthing; or of silver, worth  $\frac{1}{4}$ ths of a farthing.

**MARBLE**, in its strict and proper sense, is a rock crystallised in a saccharoidal manner, having the fracture of loaf-sugar, and composed of carbonate of lime, either almost pure when the colour is white, or combined with oxide of iron or other impurities which give various colours to it. But many other kinds of stone are popularly included under this title. Indeed any limestone rock sufficiently compact to admit of a polish is called marble. It is only in this vague sense that the indurated amorphous rocks used in this country can receive

## MARBLEHEAD—MARCELLUS.

this name. Such are the black, red, gray, and variegated limestones of the Old Red Sandstone Period found in Devonshire, which are very beautiful from the numbers of exquisitely preserved corals which abound in them; the marbles of the Carboniferous series from Flintshire, Derbyshire, and Yorkshire, so full of encrinites; the shell marbles from the Oolite rocks at Rance, Stamford, and Yovil; and the dark Purbeck and Petworth marbles, beautifully 'figured' with shells, from the Wealden strata, which were so much used by the architects of the middle ages.

Saccharine or statuary marble is a white fine-grained rock, resembling loaf-sugar in colour and texture, working freely in every direction, not liable to splinter, and taking a fine polish. Of the marbles used by the ancients, the most famous are—Parian marble, a finely granular and very durable stone, with a waxy appearance when polished. Some of the finest Grecian sculptures were formed of this marble, among others, the famous Venus de Medici. The marble of Pentelicus was at one time preferred by the Greeks to Parian, because it was whiter and less grained. The Parthenon was entirely built of it, and many famous statues still remain which were executed in this marble, but they are always more or less weathered, never retaining the beautiful finish of the Parian statues. The quarries at Carrara were known to the ancients, but they have been more extensively wrought for modern sculptors, who use this marble chiefly. It is a fine-grained, pure white marble, but is so often traversed by gray veins, that it is difficult to get large blocks free from them. Of coloured marbles, the best known are the Rosso Antico, a deep blood-red, sprinkled with minute white dots; Verde Antico, a clouded green produced by a mixture of white marble and green serpentine; Giallo Antico, a deep yellow, with black or yellow rings; and Nero Antico, a deep black marble.

The crystalline structure of marbles may be the original condition in which the rock was formed as a chemical deposition, in the same manner as some stalactites are crystalline, but there can be no doubt that they principally owe their structure to metamorphic action, which has taken place subsequent to their deposition. This action having at the same time destroyed all trace of fossils, marbles were considered formerly as belonging to the Primitive or Metamorphic series of rocks; but while they generally are members of one of the Palæozoic formations, it is now known that some of the statuary marbles of Greece and Italy are Secondary, and others even Tertiary limestones.

**MARBLEHEAD**, a seaport town of Massachusetts, United States of America, on Massachusetts Bay, 16 miles north-east of Boston. Its population was formerly devoted to the fisheries, but is now largely engaged in manufacturing, chiefly boots and shoes. The town was settled by emigrants from the Channel Islands. At the close of the revolutionary war, there were 600 widows; and at the end of the war of 1812, 500 citizens of M. were prisoners of war in England. Pop. in 1870, 7703.

**MARBURG**, an interesting old German town, capital of the province of Upper Hesse, in the electorate of Hesse-Cassel, on both banks of the river Lahn, 50 miles north of Frankfurt-on-the-Main. Its situation is strikingly beautiful. It is placed chiefly on a hill, round which are built quaint old-fashioned houses, interspersed with buildings of a later date, and separated by terrace-gardens. The hill is crowned by the stately burg or castle, while at its base extends the lovely valley of the Lahn. Of the ecclesiastical edifices, the principal is the

fine Gothic church of St Elizabeth, begun 1255, completed 1283, having two towers 303 feet in height. It was erected in honour of St Elizabeth (q. v.), daughter of Andreas II. of Hungary, and wife of Ludwig, Landgraf of Hesse and Thuringia. From her, the ancestress of the Cassel and Darmstadt branches of the House of Hesse, is descended the present (1874) Princess (Alexandra) of Wales. The castle of Marburg was built in 1065. In one of its halls, the conferences between the Wittenberg and Swiss reformers regarding the Lord's Supper took place. The university of M. was founded in 1527 by Philip the Magnanimous, Landgraf of Hesse, and soon became one of the most flourishing in Protestant Europe. Among its earliest students were the celebrated Patrick Hamilton, and William Tyndale, the translator of the English Bible. The university has four faculties—Theology, Jurisprudence, Medicine, and Arts; and comprises about forty professors, twenty lecturers, and from 300 to 350 students. It contains a library of 120,000 volumes. Extensive potteries and tanneries are in operation. Pop. (1871) 8951.

**MARCATO**, in Music, means in a strongly accentuated or marked manner.

**MARCELLUS**, **M. CLAUDIUS**, a famous Roman general, of one of the most eminent plebeian families. He was consul for the first time in 222 B.C., and obtained a decisive victory over the Insubrians in Cisalpine Gaul, slaying with his own hand their king, Britomartus or Viridomarus, whose spoils he dedicated to Jupiter, and was honoured with a triumph. This was the third and last occasion in Roman history on which *spolia opima* were offered to the gods. In the Second Punic War, M. fought as prætor, in 216 B.C., against Hannibal at Nola, in Campania; and the victory which he gained was the more important, as it shewed that Hannibal was not invincible, and that the Romans had not been irreparably overthrown at Cannæ. In the course of two years, he thrice repulsed the Carthaginian general at this place. Being consul again in 214 B.C., he was intrusted with the command of the war in Sicily. He took Leontini, massacring in cold blood 2000 Roman deserters whom he found there, and then advanced against Syracuse, which he tried to storm. All his efforts were rendered unavailing by the skill of Archimedes (q. v.), and he was compelled to regularly blockade the city. Famine, pestilence, and ultimately treachery on the part of the Spanish auxiliaries of the Syracusans, enabled M. to make himself master of the place (212 B.C.), after which the remainder of Sicily was soon brought under the dominion of the Romans. He was the first Roman general who adopted the practice (afterwards so common) of despoiling conquered cities of their works of art. In 210 B.C., he was again consul, and was again opposed to Hannibal, with whom he fought an indecisive battle at Numistro, in Lucania, and by whom he was defeated at Canusium, in Apulia, in 209 B.C., but on the day following retrieved the defeat. In 208 B.C., he was for the fifth time elected to the consulate, and assumed once more the command of the Roman army against Hannibal. When out reconnoitring one day, he fell into an ambuscade, and was slain. The Carthaginian general treated his remains with honour. It ought to be noticed that the accounts of M.'s life given by Livy, Plutarch, and others, are believed to be very much coloured and distorted—as Polybius, one of the best and most trustworthy authorities on the Punic War, denies that he ever defeated Hannibal at all!

**MARCELLUS**, the name of two popes, of whom the latter deserves special notice, as having, when

## MARCH—MARCION.

Cardinal Marcello Cervini, taken a very prominent part in the discussions of the Council of Trent, over which he was appointed to preside as legate of Julius III. He is also remarkable from the minor but curious circumstance of his not complying with the ancient custom by which the pope, on his election, lays aside his baptismal name, and assumes a new one. Marcello Cervini retained on his elevation the name which he had previously borne. He was elected March 9, 1555, and survived his elevation but 22 days.

**MARCH**, the first month of the Roman year, and the third according to our present calendar, consists of 31 days. It was considered as the first month of the year in England until the change of style in 1752, and the legal year was reckoned from the 25th March. The Anglo-Saxons called it *Hylt monath*, stormy month, and *Hraed monath*, rugged month. There is an old proverb, still used by the English and Scotch rustics, which represents March as borrowing three days from April; and in *The Complaynt of Scotland* they are thus described:

The first it shall be wind and weat;  
The next it shall be snaw and sleet;  
The third it shall be sic a freeze  
Shall gar the birds stick to the trees.

But it is disputed whether these 'borrowed days' are the last three of March or the first three of April.

**MARCH**, a musical composition, chiefly for military bands, with wind instruments, intended to accompany the marching of troops. There are slow and quick marches, also marches peculiar to different countries.

**MARCHANTIA**, a genus of *Hepaticae* (q. v.), the type of a sub-order distinguished by the spore-cases bursting irregularly, and the spores being mixed with elaters, by some botanists elevated into a distinct order. Several species are natives of Britain, some of which are very common in moist shady situations, covering rocks, earth, &c., with their spreading green lichen-like fronds.

**MARCHEÑA**, a town of Spain, in the province of Sevilla, and 33 miles east-south-east of the city of that name, in a district rich in corn and olives. In the vicinity are sulphur baths, to which many invalids resort. Pop. 11,600.

**MARCHES**, the boundaries between England and Scotland, also between England and Wales. See **MARK**.

**MARCHES**, in Scotch Law, mean the boundaries of property. By an ancient Scotch statute, one proprietor can compel an adjoining proprietor to join him in erecting a mutual fence, or to bear half the expense thereof. No such power exists in England or in Ireland.

**MARCHING**, one of the first necessities to distinguish a body of disciplined troops from a mere crowd of men, is a regular cadenced step, taken by every individual at the same time and with the same foot. The necessity of this for harmonious action is obvious. The ancient Roman legions had military music to beat time for their march. In the feudal ages, when infantry fell into disrepute, cadenced marching was unattended to, and seems only to have been thoroughly revived by Marshal Saxe. The best music for a march is found to be some simple tune, such as can readily be performed by drums and fifes. The music, besides preserving the time, acts as a preventive of fatigue.

In the British service, there are the slow march of 75 paces, each of 30 inches, in a minute—only used on parade; the quick march, of 110 paces, in which all evolutions are performed; and the double-quick, of 150 running paces, with the

knees raised high. This last cannot be sustained for any great distance, and is employed in a charge, or in suddenly occupying a hill or some commanding position, and in a few short internal movements of regiments.

**Countermarching** is an evolution by which a body of men change front, and at the same time retain the same men in the front-rank. The operation for a company will be understood by the annexed diagram, where the solid line represents the first

Countermarching:

AB, ab, original position; A<sub>2</sub>B<sub>2</sub>, a<sub>2</sub>b<sub>2</sub>, the new position. The arrows denote the direction in which the ranks face.

position, and the broken line that afterwards takes up, the movement being represented by 'right face, quick march, left wheel, forward, halt, front, dress.' On the same principle, a whole army will sometimes change front. If after the countermarch the order 'rear-face' be given, the same front will be preserved, with the rear-rank in front, and what was previously the right now serving as the left. A rear-rank may also become a front-rank by merely countermarching round the end of the latter, which remains stationary.

**MARCIANTSI**, a town of the Italian province of Terra di Lavoro (Caserta), situated 13 miles north of Naples, in a low unhealthy plain, in the midst of several lakes. Pop. 9210.

**MARCION**, the founder of the Marcionites, an extremely ascetic Gnostic sect, was the son of a Bishop of Sinope in Pontus. In his earlier years, he was a sailor or ship-master. Being excommunicated by his father, on account of his heretical opinions, he went to Rome about 140 A.D. He made several anxious efforts to obtain a reconciliation with the Catholic Church, for he does not appear to have loved schism; but his restless, prying, theorising intellect constantly led him into opinions and practices too hostile to those of his fellow-Christians to permit of their being passed over in silence. After his final excommunication, he associated himself with the Syrian Gnostic Cerdon, and founded a system, in some respects, quite antagonistic to Christianity. The gospel of Christ, according to him, consisted in free love of the Good; the Mosaic system, with its motives of rewards and punishments, was mere legality; and there is as irreconcilable an opposition between the respective authors of the 'Law' and the 'Gospel,' i.e., the Creator, on the one hand, and the God of the Christians, on the other, as there is between these two works. His system is but imperfectly known; and it is supposed to have assumed either three or four aboriginal beings—Good, Evil, Creator, and Matter. See **GNOSTICS**. Respecting the outward form of worship practised among his followers, little is known save that it had great similarity—as had their whole religious system—to that of the Manichæans (q. v.). M. entirely rejected the Old Testament; and of the New Testament, all but a few Epistles and the Gospel of St. Luke, which had also to undergo certain changes from his hand. The first four chapters were omitted, and the fifth he began with the words: 'In the 15th year of the reign of Tiberius Caesar, God came to Capernaum, a city of Galilee, and spoke on the Sabbath.' The

## MARDIN—MARGARET.

Marcionites subsisted as a distinct party till the 6th c., and were diffused through Syria, Egypt, Palestine, &c. Tertullian and others wrote against them.

**MARDIN**, a considerable town of Asiatic Turkey, is strikingly situated, at an elevation of 2900 feet, on the southern slopes of the Mardin Hills (anciently Mount Masius), 57 miles south-east of Diarbekir. It contains numerous mosques, bazaars, and baths, and the ruins of an old castle. The ornaments in Arabesque on the gates of the citadel are said to be finer than those of the Alhambra. Pop. about 15,000, of whom the half are Moslem Kurds, and the other half Chaldeans, Maronites, and Jacobites (q. v.), and who carry on manufactures of linen and cotton fabrics, and of leather. During the decline of the khalifate of Bagdad, M. rose to considerable importance, and was for a long time the capital of a principality under a branch of the Ayubites (descendants of Salah-ed-din), but its short-lived glory was soon after quenched by the advancing tide of the Mongols. It was subsequently taken by Timûr.

**MAREE**, LOCH, in the west of Ross-shire, Scotland, is 18 miles in length, with a breadth varying from one to three miles, and a depth, in some places, of 60 fathoms. Owing to its great depth, it never freezes over its whole extent. It is surrounded by mountain-scenery which, for wildness and grandeur, is not excelled in Scotland. Its waters are carried off to the sea by the river Ewe, two miles in length. The loch contains numerous inlets, one of which contains the remains of an ancient chapel, with a graveyard.

**MAREMMA** (corrupted from *Marittima*, situated on the sea), a vast marshy region of West Italy, extending along the sea-coast of Tuscany, from the mouth of the Cecina to Orbitello, and embracing an area of 997 square miles. The Pontine Marshes and the Campagna of Rome are similar districts. Formerly, these Maremme were fruitful and populous plains; but neglect of the water-courses of the district allowed the formation of marshes; and now they have become generators of tertiary fevers, and present an aspect of dreary desolation in the summer months, when the inhabitants flee from their miasmata, prejudicial alike to man and beast. Leopold II., the late Grand Duke of Tuscany, directed especial attention to the drainage and amelioration of the Tuscan Maremme, and considerable success attended their being largely planted, trees being a corrective of their malarious effects. From 1828 to 1848 the cost of the drainage of the M. was £531,000. The arable land in the vicinity of the M. is exuberantly fertile; but the harvests are gathered by hired labourers in the most infected districts, and in their emaciated and livid features may be seen the fatal action of malaria. During winter, the M. is inhabitable, and yields good pasture.

**MARENGO**, a village of Italy, in the Sardinian province of Alessandria, situated near the Bormida, in the midst of extensive forests. M. was the scene of a memorable battle, in which a French army, commanded by Bonaparte, and numbering somewhat more than 20,000, defeated and routed 32,000 Austrians, under General Melas, on the 14th June 1800.

**MAREOTIS**, or **MAREIA**, LAKE, the modern *Birket-el-Marîût*, a salt lake or marsh in the north of Egypt, extends southward from the city of Alexandria, and is separated from the Mediterranean, on its north-west side, by a narrow isthmus of sand. In ancient times, its length was about 42 miles, its breadth about 22. Its shores were

planted with olives and vines, and the papyrus, which grew upon its banks and on its eight islets, was famous for its fine quality. In more recent times, the canals which fed Lake M. were neglected, and its depth and area were much reduced. In the 18th c., the bed had become, in great part, a sandy waste; but in 1801, during the war between the English and French, the sea was let in by the former, and it is now again a marshy lake. The passage by which the sea found entrance was subsequently closed up by Mehemed Ali. The present dimensions of the lake are about 27 miles long by 25 miles broad.

**MARGARET**, sometimes called the 'Northern Semiramis,' queen of the triple Scandinavian kingdom of Denmark, Norway, and Sweden, was the second daughter of Valdemar III., king of Denmark, and wife of Hakon VIII., king of Norway. M. was born in 1353, and on the death of her father, without direct male heirs, in 1375, the Danish nobles, passing over the son of Valdemar's eldest daughter, Ingeborg of Mecklenburg, offered the crown to M. and her husband in trust for their infant son Olaf. By the death of Hakon in 1380, M. became sole guardian of the young prince, who died at the age of 17 in 1387; and such was the discretion with which she had conducted the government during her sole regency, that the estates of both kingdoms concurred in electing her as their joint sovereign ruler. Having received the crown at their hands, she convoked a *landthing*, in which she announced that, with the concurrence of her subjects, she would nominate her grand-nephew, Eric of Pomerania, as her successor; and although, owing to Eric's infancy at the time, and his subsequent incapacity, the real power rested in the hands of M., she contented herself from that time with the title of 'Margaret, by the grace of God, daughter of Valdemar, king of Denmark.' At the moment that M. was cementing the union of Norway and Denmark, the condition of affairs in Sweden opened the way for a further extension of her power; for the Swedish king, Albert of Mecklenburg, had so thoroughly alienated the affections of his subjects, that the nobles, declaring the throne vacant, offered to acknowledge M. as their ruler. The queen lost no time in sending an army into Sweden to support her pretensions, and defeated the king's German troops at Leaby, where Albert and his son Eric fell into her hands. Albert remained in prison seven years, during which time M. succeeded in wholly subjugating Sweden; and in 1397 she made her triumphal entry into Stockholm, with her nephew Eric, who shortly afterwards was, in his 16th year, crowned king of the three Scandinavian kingdoms. On this occasion, M. brought forward the memorable Act of Union, which she had drawn up with her own hand, and to which were appended the signatures of seventeen of the principal men in the three kingdoms. By this remarkable act, known as the Union of Calmar, from the place at which it was signed and first promulgated, it was stipulated that the three kingdoms should remain for ever at peace under one king, retaining their own laws and customs; and that, at the death of the sovereign, if he left several sons, one of their number should be chosen by the combined estates of the three realms, who were also to elect a new king in the event of the deceased monarch having died childless. It had required all the genius and conciliatory power of a M. to fuse the discordant elements, of which her triple sovereignty were composed, into harmony, and it is scarcely to be wondered, therefore, that her utopian schemes for one vast Scandinavian unity of empire should have utterly broken down at her death, and sown the

# MARGARET—MARIA CHRISTINA.

seeds of dissension for centuries to come. The Swedes, who were jealous of the Danes, never cordially concurred in the act, and were the first to attempt to set it aside. M. died in 1412, leaving the character of a politic and able ruler. Where fair means failed to secure her ends, she shewed herself ready to act with the astute craft for which her father had been noted; and while she possessed unusual powers of fascination, she seems to have combined masculine vigour with considerable beauty of person. By the Danes, M. has been especially venerated; but they have reason to the present day to lament the political blunder to which the pressure of circumstances drove her, when she converted Holstein into a hereditary fief, and thus severed it more completely from the crown, to which it had previously stood in the relation of an appanage.

**MARGARET**, St. Queen of Malcolm Canmore (q. v.).

**MARGARET OF ANJOU**, wife of Henry VI. of England, and daughter of René of Anjou, the titular king of Sicily, and of Isabella of Lorraine, was born at Pont-à-Mousson, in Lorraine, March 1425. She was married to Henry VI. of England in 1445; and her husband being a person of very weak character, she exercised an almost unlimited authority over him, and was the virtual sovereign of the realm; but a secret contract at her marriage, by which Maine and Anjou were relinquished to the French, excited great dissatisfaction in England. The strife between the English and French, which lost to the former the whole of their possessions in France except Calais, was charged upon Margaret. In 1450, occurred the insurrection of Jack Cade, and soon after, the country was plunged in the horrors of that bloody civil war known as the *Wars of the Roses* (q. v.). After a struggle of nearly 20 years, M. was defeated and taken prisoner at Tewkesbury, and imprisoned in the Tower, where she remained five years, till Louis XI. redeemed her for fifty thousand crowns. She then retired to France, and died at the château of Daupierre, near Saumur, in Anjou, 25th August 1482.

**MARGARIC ACID** ( $C_{34}H_{54}O_8$  . HO) is one of the solid fatty acids. At an ordinary temperature, it is solid, white, and crystalline; it makes a persistent greasy spot on paper; it is perfectly insoluble in water, dissolves in boiling alcohol, from which it separates in glistening groups of very delicate needles, appearing under the microscope as bunches of lily-leaf-shaped crystals, or in star-like forms, and is readily soluble in ether. It unites with bases, forming margarates, and in combination with glycerine (q. v.) forms the glyceride or fat known as margarine.

This acid occurs either in a free state or in combination with alkalies in most of the animal fluids, with the exception of the urine, and as a glyceride it is widely diffused in the animal and vegetable fats. Heintz has thrown considerable doubt on the existence of this acid, and maintains that it is a mixture of about ten parts of Palmitic Acid (q. v.) with one part of Stearic Acid (q. v.).

**MARGARINE** ( $C_{708}H_{1104}O_{132}$ ) appears, from the researches of Berthelot (who has succeeded in forming this and other fats artificially), to be a combination of three equivalents of hydrated margaric acid with one equivalent of glycerine, with the loss of six equivalents of water; or in symbols—

It constitutes the solid ingredient of human fat, of

butter, of goose-grease, of olive oil, &c. It crystallises from hot alcohol as a white flocculent powder, which under the microscope appears in the form of very delicate needles, so grouped as to radiate from one point, and thus to form a whorl of fine capillary threads. According to the views of Heintz, referred to in the article **MARGARIC ACID**, margarine is a mixture of palmitine and stearine.

**MARGARITA**, an island in the Caribbean Sea, belonging to the South American republic of Venezuela. Length, 40 miles; average breadth, 12 miles; area, 441 square miles. Pop. estimated at 15,000. M. was discovered by Columbus in 1498, and was long famous for its pearl-fisheries, whence its name.

**MARGARITA, SANTA**, a town of Sicily, 42 miles north-west Girgenti. Pop. 7000.

**MARGATE**, a municipal borough, seaport, and famous watering-place of England, in the Isle of Thanet, Kent, about 70 miles east-south-east of London. All the usual resources of a watering-place—theatre, baths, libraries, assembly-room, &c.—are found here; and a fine pier, which is the principal promenade. The shore, covered with a fine and firm sand, is well adapted for sea-bathing. Fishing is carried on to a considerable extent. A fluctuating population of between 50,000 and 100,000 is poured into the town during the season. Pop. (1871) 11,995.

**MARGUERITE DE VALOIS**, in her youth known as Marguerite d'Angoulême, sister of Francis I. of France, and daughter of Charles of Orleans, Comte d'Angoulême, was born at Angoulême, 11th April 1492. She received a brilliant, and even a profound education, Greek and Hebrew being among her accomplishments, as well as Spanish, Italian, and Latin; yet she was characterised by the most charming vivacity. In 1509, she was married to Charles, Duke of Alençon, who died in 1525. Out of love to her brother, Francis I., she repaired to Madrid, to attend him in his sickness, during his imprisonment there. In 1527, she was married to Henry d'Albret, king of Navarre, to whom she bore a son, who died in infancy, and a daughter, Jeanne d'Albret, mother of the great French monarch, Henri IV. She encouraged agriculture, the arts and learning, and to a certain extent embraced the cause of the Reformation. When the persecution of heretics in France began to wax hot, and furious monks declared that she ought to be tied up in a sack, and pitched into the Seine, she felt it necessary to be prudent and reserved in her speech, and in her later years even returned to the practices of the Roman Catholic Church. But she never ceased to act with a courageous generosity towards the Reformers, who always found an asylum and welcome in Navarre. She wrote a little religious work, *Miroir de l'âme Pécheresse*, which was condemned by the Sorbonne, as favouring Protestant doctrines. She also wrote poems and tales, and a *Heptaméron des Nouvelles* (Par. 1559, and other editions). This last is a singular performance for a pious lady like M.—one hardly knows what to make of it. Inferior to its model (the *Decameron* of Boccaccio) in point of genius and inventiveness, it fully equals it in indecency. It has been translated into English, and forms one of Bohn's *extra volumes*. M. died at Orléans, in Bigorre, 21st December 1549.

**MARIA CHRISTINA**, Queen of Spain, born at Naples, 27th April 1806, is a daughter of Francis I., king of the Two Sicilies. On the 11th December 1829, she became the fourth wife of Ferdinand VII. of Spain; who, anxious to secure the throne to his own posterity, restored in March 1830 the law of '*Siete partidos*,' by which, in

# MARIA LOUISA—MARIA THERESA.

default of male issue, the right of inheritance was given to females, and in October of that year the queen gave birth to a daughter, Isabella I., ex-queen of Spain. The Spanish liberals gladly embraced the cause of the queen, rejoicing to see the dreaded Don Carlos, Ferdinand's brother, further removed from probable succession to the throne. Ferdinand died, 29th September 1833, and by his testament his widow was appointed guardian of her children—the young Queen Isabella, and the Infanta Maria Louisa, now Duchess de Montpensier—and also regent, till the young queen should attain the age of eighteen years. A civil war broke out, the adherents of Don Carlos seeking to place him on the throne. The event of this war, which continued till 1840, was long doubtful, and Spain was fearfully desolated by contending armies; but the queen-mother seemed indifferent to everything except the company of Don Fernando Muñoz, one of the royal body-guard, whom she made her chamberlain, and with whom she was united, in December 1833, in a morganatic marriage, which, however, was kept secret, whilst her connection with him was no secret. She has had ten children by him. A conspiracy, which broke out on the night of the 13th August 1836, exposed Muñoz to great danger, and led the queen-mother to concede a constitution to Spain. Her practice as regent was to adopt the course agreeable to the minister of the day, and thus her government was despotic under one ministry and liberal under another. She contrived, however, upon many occasions to embarrass the proceedings of her more liberal or constitutional ministers; but when she sanctioned by her signature the law respecting the Ayuntamientos (q. v.), a popular commotion ensued, and she gave to the new prime minister Espartero (q. v.), 10th October 1840, a renunciation of the regency, and retired to France, but continued to interfere from her retirement in the affairs of Spain. After the fall of Espartero, she returned to Madrid in 1843, and in October 1844, her marriage with Muñoz, who was now made Duke of Rianzares, was publicly solemnised. Her participation in the schemes of Louis Philippe as to the marriage of her daughters, in 1846, and the continual exercise of all her influence in a manner unfavourable to constitutional liberty, made her the object of great dislike to the whole liberal party in Spain. At length, in July 1854, a revolution expelled her from the country, and she again took refuge in France, but returned to Spain in 1864, only to retire again in 1868.

**MARIA LOUISA**, the second wife of the Emperor Napoleon I., born 12th March 1791, was the daughter of the Emperor Francis I. of Austria. She was married to Napoleon, after his divorce of Josephine, 2d April 1810. The marriage seemed to give stability to the Bonaparte dynasty, and in some measure to afford a prospect of peace to Europe. On 20th March 1811, she bore a son, who was called King of Rome. At the beginning of the campaign of 1813, Napoleon appointed her regent in his absence, but under many limitations. On the abdication of Napoleon, she went to Orleans, and thence, in company with Prince Esterhazy, to Rambouillet. She was not permitted to follow her husband, but went with her son to Schönbrunn, where she remained till, in 1816, she received the duchies of Parma, Placenza, and Guastalla, on the government of which she then entered. She contracted a morganatic marriage with Count von Neipperg. She died at Vienna, 18th December 1847.

**MARIA THERESA**, Empress of Germany, the daughter of the Emperor Karl VI., was born at Vienna, 13th May 1717. By the Pragmatic Sanction

(q. v.), her father appointed her heir to his hereditary thrones. In 1736, she married Francis Stephen, Grand Duke of Tuscany, to whom she gave an equal share in the government when she became Queen of Hungary and of Bohemia, and Archduchess of Austria, on the death of her father, 21st October 1740. She found the monarchy exhausted, the finances embarrassed, the people discontented, and the army weak; whilst Prussia, Bavaria, Saxony, Naples, and Sardinia, stirred up by France, put forward claims to portions of her dominions, chiefly founded on the extinction of the male line of the House of Hapsburg. Frederick II. of Prussia soon made himself master of Silesia; Spain and Naples laid hands on the Austrian dominions in Italy; and the French, Bavarians, and Saxons conquered some of the hereditary Austrian territories. The young queen was in the utmost danger of losing all her possessions, but was saved by the chivalrous fidelity of the Hungarians, the assistance of Britain, and most of all by her own resolute spirit. Her enemies also quarrelled amongst themselves; and the War of the Austrian Succession, after lasting more than seven years, terminated in her favour by the peace of Aix-la-Chapelle in 1748. She lost only Silesia and Glatz, and the duchies of Parma, Placenza, and Guastalla, whilst, on the other hand, her husband was elected emperor. During the time of peace, she made great financial reforms; agriculture, manufactures, and commerce flourished, the national revenues greatly increased, and the burdens were diminished. The empress availed herself of the increase of the revenue for the increase of her military power. She held the reins of government herself, but was much guided by her husband and her ministers. She found at last in Kaunitz (q. v.) a minister possessed of the wisdom and energy requisite for the conduct of affairs, and in him she placed almost unlimited confidence. The *Seven Years' War* (q. v.) between Austria and Prussia again reduced Austria to a state of great exhaustion; but when it was concluded, the empress renewed her efforts to promote the national prosperity, and made many important reforms, ameliorating the condition of the peasantry, and mitigating the penal code. Her son Joseph was elected king of the Romans in 1764; and on the death of her husband, in 1765, she associated him with herself in the government of her hereditary states, but in reality committed to him the charge only of military affairs. She joined with Russia and Prussia in the partition of a third part of Poland (1772), after the death of Augustus III., although she at first objected to the proposed spoliation, and thought it necessary to satisfy her conscience by obtaining the approval of the pope. Galicia and Lodomeria were added to her dominions at this time. She also compelled the Porte to give up Bukowina to her (1777). The brief Bavarian war of succession ended in her acquisition of the Innthal, but led to the formation of the *Fürstenthum* or *League of German Princes*, which set bounds to the Austrian power in Germany. M. T. died 29th November 1780. Throughout her reign, she displayed a resolute and masculine character, and raised Austria from deep depression to a height of power such as it had never previously attained. Although a zealous Roman Catholic, she maintained the rights of her own crown against the court of Rome, and endeavoured to correct some of the worst abuses in the church. She prohibited the presence of priests at the making of wills, abolished the right of asylum in churches and convents, suppressed the Inquisition in Milan, and in 1773 the order of Jesuits. She also forbade that any person, male or female, should take monastic vows before the age of 25 years. She did nothing, however, to

ameliorate the condition of the Protestants in her dominions. She had three sons and six daughters. Her eldest son, Joseph II., succeeded her.

MARIANA, JUAN, a distinguished Spanish historian and scholar, was born at Talavera in 1537, and in 1554 entered the then rising order of the Jesuits. His early studies, both in languages and theology, were so brilliant that he was appointed to teach in the schools of his order, first at Rome (where the celebrated Bellarmine was one of his scholars) in 1561, afterwards in Sicily in 1565, and finally in Paris in 1569. After a residence there of seven years, his health became so much impaired that he was compelled to return to his native country, and settled at Toledo, where he resided till his death, at an extreme old age, in 1624. His retirement, however, was not inconsistent with the most energetic and sustained literary activity. From an early period, he devoted himself to a History of Spain, of which he published 20 books in 1592, and 10 additional books, carrying the narrative down to 1516, in 1605. The original of this history was Latin, the elegance and purity of which have secured for M. a place among the most distinguished of modern Latinists. Its great historical merit also is admitted, although with some drawbacks, even by Bayle. M. himself published a Spanish translation, which still remains one of the classics of the language. Among his other productions, are a volume published at Cologne in 1609, consisting of Seven Treatises on various subjects; scholia on the Bible, which, although written at the age of 83, display a degree of vigour as of learning which might provoke the admiration of modern biblical students; an edition of the works of Isidore of Seville, with notes and dissertations; and several similar works. But the most celebrated of the works of M. is his well-known treatise, *De Rege et Regis Institutione*, which appeared in 1599, and in which is raised the important question, Whether it be lawful to overthrow a tyrant? M. decides that it is—even where the tyrant is not a usurper but a lawful king. See JESUITS. The principles of the book, in other particulars, are in the main the same as those of all modern constitutional writers. The tyrannicide doctrines of this writer drew much odium upon the entire order of Jesuits; but it is only just to observe that while, upon the one hand, precisely the same doctrines were taught in almost the same words by several of the Protestant contemporaries of M. (see Hallam's *Literary History*, iii. 130—140); on the other, M.'s book itself was formally condemned by the general Aequaviva, and the doctrine forbidden to be taught publicly or privately by members of the order.

MARIAZE'LL, the most famous place of pilgrimage in Austria, on the north border of the crown-land of Styria, 24 miles north of Bruck. It consists of a number of inns, or lodging-houses, and contains 900 inhabitants. It is visited by 250,000 pilgrims annually. Here there is an image of the Virgin believed to possess the power of working miracles. During the great annual procession from Vienna, the greater number of the pilgrims of both sexes spend the night in the woods in drinking, singing, and general riot. Formerly, the processions from Gratz and Vienna took place at the same time, but owing to the fighting, as well as debauchery, that characterised the occasion, the processions were ordained to take place at different times.

MARIE ANTOINETTE DE LORRAINE, JOSEPHINE JEANNE, wife of Louis XVI. of France, was the youngest daughter of Francis I., Emperor of Germany. Her mother was the famous Maria Theresa (q. v.). M. A. was born at Vienna,

November 2, 1755; at the age of fourteen, was betrothed to the Dauphin; and in the following year was married at Versailles. Her reception by her husband and the king, Louis XV., was flattering enough; but her Austrian frankness and simplicity, her naïveté, unceremonious pleasantry, and detestation of rigid etiquette, scandalised Versailles. Soon after the accession of Louis XVI. (May 1774), libels were circulated by her enemies, accusing her of constant intrigues, not one of which has ever been proved. Her faults, as a queen (and, in that age, rapidly growing earnest, angry, and embittered, they were fatal ones), were a certain levity of disposition, a girlish love of pleasure, banquets, fine dress, an aristocratic indifference to general opinion, and a lamentable incapacity to see the actual misery of France. The affair of the *diamond necklace* (q. v.), in 1785, hopelessly compromised her good name in the eye of the public, although, in point of fact, M. A. was quite innocent of any grave offence. Her political rôle was not more fortunate. Loménie de Brienne and Calonne were ministers of her choice, and she shared the opprobrium called down upon them for their reckless squandering of the national finances. She strongly opposed the Assembly of the Notables, and in the following year, of the States-general, and, indeed, she had good reason to dread their convocation, for one of the very first things the Notables did was to declare the queen the cause of the derangement of the finances. From the first hour of the Revolution, she was an object of fanatical hatred to the mob of Paris. Her life was attempted at Versailles by a band of assassins on the morning of October 6, 1789, and she narrowly escaped. After this, she made some spasmodic efforts to gain the goodwill of the populace by visiting the great manufactories of the capital, such as the Gobelins, and by seeming to take an interest in the labours of the workmen, but the time was gone by for such transparent shamming to succeed. The relentless populace only hated her the more. At last she resolved on flight. Her husband long refused to abandon his country, and she would not go without him. A dim sense of kingly duty and honour was not wanting to Louis, but after the mob stopped his coach (April 18, 1791), and would not let him go to St Cloud, he consented. The flight took place on the night of the 20th June. Unfortunately, the royal fugitives were recognised, and captured at Varennes. From this time, her attitude became heroic; but the French people could not rid themselves of the suspicion that she was secretly plotting with the allies for the invasion of the country. After the useless effort to defend the Tuileries (August 10, 1792), she was confined in the Temple, and separated from her family and friends. Here she was subjected to the most sickening humiliations. About a year after (August 1, 1793), she was removed to the Conciergerie, by order of the Convention, condemned by the Revolutionary Tribunal (October 15), and guillotined next day. See *Mémoires sur la vie privée de Marie Antoinette*, by Mme Campan (Paris, 1823); Buchez and Roux, *Histoire Parlementaire*; and Lacretelle, *Histoire de France pendant le XVIII<sup>e</sup> Siècle* (6 vols. Paris, 1850).

MARIE DE' MEDICI, wife of Henri IV. of France, was the daughter of Francis I., Grand-Duke of Tuscany, and was born at Florence, 26th April 1573. She was married to Henri 16th December 1600, and in the following September, gave birth to a son, afterwards Louis XIII. The union, however, did not prove happy. M. was an obstinate, passionate, waspish, and withal dull-headed female,

## MARIE GALANTE—MARINE FORTIFICATION.

and her quarrels with Henri soon became the talk of Paris. She was—as such women are apt to be—wholly under the influence of favourites. A certain couple, who professed to be man and wife, Leonora Galigai and Concini, exercised a most disastrous influence over her mind, and, of course, encouraged her dislike to her husband. The assassination of Henri (May 14, 1610) did not much grieve her, and she was even suspected of complicity in the act, but nothing was ever ascertained that could incriminate her. For the next seven years, she governed as regent, but proved as worthless a ruler as she had been a wife. After the death of Concini, a sort of revolution took place. Louis XIII. assumed royal power. She was confined to her own house, and her son refused to see her. Her partisans tried to bring about a civil war, but their attempts proved futile; and by the advice of Richelieu, then Bishop of Luçon, she made her submission to her son in 1619, and took her place at court. M. hoped to win over Richelieu to her party, but she did not in the least comprehend that mighty genius; however, she soon enough found out that he had no mind to be ruled by her, whereupon she resolved, if possible, to undermine his influence with the king. Her intrigues for this purpose failed; she was imprisoned in Compiègne, whence she escaped, and fled to Brussels in 1631. Her last years were spent in utter destitution, and she is said to have died in a hayloft at Cologne, 31 July 1642.

**MARIE GALANTE**, an island in the West Indies, one of the Lesser Antilles, belongs to France, and lies 17 miles south-east of Guadeloupe. Area, about 60 square miles, covered for the most part with wood, and surrounded by steep rocky shores. The cultivated soil produces sugar, coffee, and cotton. Cattle and horses are abundant, the latter of a highly esteemed breed. Its chief town, Grand-bourg, or Marigot, on the south-west coast, has a population of 2000. The population of the island is 13,000. M. G. is so called from the name of the ship commanded by Columbus when he discovered the island in 1493.

**MARIENBAD**, one of the most frequented of the Bohemian spas, 33 miles north-west of Pilsen, at an elevation of almost 2000 feet above the level of the sea. The springs of M. have long been used by the people of the vicinity, but it is only since the commencement of the present century that it has become a place of resort for persons from distant parts of the world. The springs are numerous, varying in temperature from 48° to 54° Fahrenheit. They are saline, containing sulphate of soda and various alkaline ingredients, but differing considerably in their composition and qualities. They are used both internally and in the form of baths. Great quantities of the waters of some of the springs are exported to distant places. M. is surrounded by wooded heights, has a population of 1100, and is visited every season by upwards of 9000 patients.

**MARIENBURG**, an old town of Prussia, in the province of West Prussia, on the Nogat, 28 miles south-east of Danzig. It was long the seat of the Grand Masters of the Teutonic Order (q. v.) of Knights, who removed from Venice hither in the year 1300. The first fortress of the Knights, however, was founded here in 1274. M. remained in the hands of the Knights till 1457, when it was taken by the Poles. The castle, or palace, in which 17 Grand Masters had resided, a noble edifice in a species of Gothic peculiar to the vicinity of the Baltic, was restored in 1820. Pop. (1871) 8235.

**MARIENWERDER**, one of the most prosperous and beautiful towns of the province of West Prussia, is picturesquely situated on an elevation, about two miles east of the Vistula, and 47 miles south-south-east of Danzig. It was founded in 1233 by the Teutonic Order of Knights, and its old castle was the residence of a commander of that order. The town derives its prosperity chiefly from being a residence of numerous government officials. Manufactures of various kinds are carried on, and fruit is extensively cultivated. Pop. 7172.

**MA'RIGOLD**, a name given to certain plants of the natural order *Compositæ*, sub-order *Corymbifera*, chiefly of the genera *Calendula* and *Tagetes*. The genus *Calendula* has the achenia remarkably curved, variously toothed, and very rough on the back. The species are annual and perennial herbaceous plants and shrubs, of which some of the former are found in the countries bordering on the Mediterranean, the latter chiefly in South Africa. For M. (*C. officinalis*) is an annual, a native of France and the more southern parts of Europe, with an erect stem, 1–2 feet high, the lower leaves obovate on long stalks, and large, deep yellow flowers. It has long been very common in British gardens, and there are varieties with double flowers. The whole plant has a slight aromatic odour, and a bitter taste. It was formerly in great repute as a carminative, and was regarded also as an aperient and sudorific. The florets were the part used, and they were dried in autumn, to be preserved for use. They are often employed to adulterate saffron, and sometimes for colouring cheese. They were formerly a frequent ingredient in soups, and are still so used in some parts of England.—The genus *Tagetes* consists of annual and perennial herbaceous plants, natives of the warmer parts of America, although *T. erecta*, one of those most frequently cultivated in Britain, bears the name of AFRICAN MARIGOLD; and *T. patula*, another annual well known in our flower-borders, is called FRENCH MARIGOLD. Both species are Mexican. They have been long in cultivation, and with a little assistance of a hotbed in spring, succeed well even in Scotland, and are much admired for the brilliancy of their flowers.—CORN M. is a *Chrysanthemum* (q. v.).—MARSH M. (q. v.) has no botanical affinity with the true marigolds.

**MARINE ENGINE.** See STEAM-ENGINE.

**MARINE FORTIFICATION** differs from land fortification in that the approaches of the enemy which are to be resisted take place on the level of the sea, so that he can come near without having to overcome the dangerous slope of the glacis. The combat is simply one between two powerful batteries, and the question to be decided is, whether the ship or the fort will first be placed *hors de combat*: the ship having ordinarily the largest number of guns, while the fort has more solid battlements, and its fewer guns of great calibre can be fired with a steadiness unattainable on so shifting a base as the ocean. Under these circumstances, the less relief a sea-fortress has the better, as by so much the less is it likely to be hit from the shipping. Its walls are usually built perpendicular, or nearly so. The magazines and quarters for the men are bomb-proof, as also are the casemates, from which the guns are usually fired, although sometimes, as in the martello-tower, the gun is worked on the top of the structure.

Sea-fortifications may be of various importance; the simplest being the battery consisting of a mere parapet formed in a cliff or on a hill, and mounted with guns to command the sea; these are generally built in such concealed situations, that it is hoped the hostile ships will not perceive them until they

## MARINE-STORE DEALERS—MARINI.

actually open fire. They are numerous all around the British coast. Next greater in importance is the Martello Tower (q. v.). More powerful still are the beach-forts, such as those which on either shore defend the entrance to Portsmouth harbour: these are constructed of the most solid masonry, faced with massive iron plates, and armed with guns of the heaviest calibre, sweeping the very surface

Casemated Bomb-proof Sea-fort:

A, casemate embrasures; a, loopholes for small arms;  
b, guns mounted on barbette.

of the sea, so as to strike an approaching ship between wind and water. The guns are usually in bomb-proof casemates, and the fort is often defended on the land side, if the coast be level; if, however, higher ground be behind, this would be useless, and then the sea-front alone is defensible. Most terrible of all sea-forts, however, are the completely isolated forts, with perpendicular faces and two or three tiers of heavy guns. Such are the tremendous batteries which render Cronstadt almost inaccessible, and by which Spithead and Plymouth Sound are now being fortified. These forts are generally large, with all the requisites for a garrison to maintain itself; against them, wooden ships stand no chance, and in the American Civil War, Fort Sumter at Charleston shewed itself no mean antagonist for iron-sides. In such forts, iron is employed as the facing, in plates of such vast thickness and weight, that it is supposed no ship can ever possess any comparable resisting power; and as they are armed with guns, the smallest of which will probably be 300-pounders, it is expected that they will be able to destroy any fleet that could be sent against them.

At the present day, the value of sea-fortifications is disputed, as iron-plated vessels may pass them with impunity, unless the artillery in the fort be so heavy as to destroy the armour of the ships. In the long-run, however, it is apparent that the fort can command the greater power; for its armour may be of any thickness, while that of the ship must be limited by her floating powers, and on the other hand, the limit to the size of artillery must be sooner reached in a ship than in a solid and stationary fortress.

**MARINE-STORE DEALERS**, in point of law, are subjected to certain restrictions as regards the business they carry on, in order to keep some check on their relations with thieves and other vendors of stolen property. They are bound, under a penalty of £20, to have their name and the words 'Dealer in Marine Stores' distinctly painted in letters not less than six inches in length over their warehouse or shop; to keep books stating the name of the person from whom they bought or received the respective

goods; not to purchase marine stores or articles exceeding in value £100 without a permit from justice of the peace, and to be subjected to a search of their books by a dealer in old

metal has been once convicted of being in possession of stolen property, justices of the peace may order him to be registered at the chief police-office of his district, and he shall keep a book containing entries of the goods he has, and of the person from whom obtained, &c.

**MARINED**, a term applied in Heraldry to an animal whose lower part is terminated like the tail of a fish.

**MARINES** are soldiers that serve on board ships of war. The men are drilled in all respects as soldiers (light infantry), and therefore on shore are simply ordinary land-forces. On board ship, they are trained to seamen's duties, but still preserving their military organisation. Their ordinary functions are as sharpshooters in time of action, and at other times to furnish sentries for guarding the stores, gangways, &c. They are useful as exercising a good control over the less rigidly disciplined sailors; and having always firearms and bayonets ready, they have often been instrumental in suppressing the first outbreaks of mutiny. The Royal Marines are divided into three divisions of light infantry and one of artillery. Promotion goes by seniority throughout the artillery and infantry respectively. In rank, marine officers correspond with army officers of similar grades according to seniority; as a corps, the marines take place between the 49th and 50th regiments of infantry of the line. Every ship, on being commissioned, has her complement of marines drafted into her. The uniform is red, with blue facings and white belts. On their colours, the men proudly bear the word 'Gibraltar,' in the famous defence of which fortress they bore an heroic part.

Marines were first established, as a nursery from whence to obtain seamen to man the fleet, by order in council of 16th October 1664. Their utility becoming conspicuous, other regiments of marine forces were raised, so that by 1741 there were 10,000 men, and in 1759 as many as 18,000. During the great French war, the number rose above 30,000, but a great reduction took place after peace was concluded. By the navy estimates of 1873-1874, 14,000 marines are provided, including 2900 artillery, at a cost for the year of £763,997. Their government rests solely with the Admiralty.

**MARINI**, GIOVANNI BATISTA, an Italian poet, born at Naples in 1569. After a period of fruitless study, M. abandoned jurisprudence for the more congenial pursuit of poetry, a decision which so incensed his father as to lead to his expulsion from home. All through life, M. seems to have courted troubles by his unbridled licentiousness, and many of his best compositions are polluted with a shameless obscenity, unavailingly deplored by the poet at the approach of death, when he expressed the desire that they should be suppressed and destroyed. M. quitted Naples for Rome, and finally followed in the suite of Cardinal Aldobrandini to Turin, where he was at first received with flattering notice from the reigning prince, Charles Emmanuel; but on the publication of some biting satirical verses, he was thrown into prison. On his release, he repaired to France, where Marie de' Medici received him with marked favour, and conferred on him a liberal pension. In his poem *Il Tempio* he celebrates the queen's noble qualities. His best work, the *Adone*, was written during his residence in France, and on its publication, he revisited his native country (1622), and died at Naples, aged 56, in 1625, in the midst of high public festivities in his honour. He is the founder of the *Marinist* school of poetry, of which the essential features are florid hyperbole and false overstrained imagery.

## MARINO—MARIOLATRY.

**MARINO**, or **SAN MARINO**, one of the most ancient and most limited republican states of Europe, consists of a craggy mountain 2200 feet in height, situated amidst the lesser ranges of the Apennines, and encircled by provinces formerly belonging to the Pontifical States. It possesses a total area of 21 miles, and comprises a town of the same name, and several villages in the adjacent territory. The climate is healthy, but, owing to its exposure, high winds and frequent rains prevail. The town of M. is built on a slope of the mountain; it is accessible only by one road, and is protected by walls and towers; it contains several squares and streets, rudely paved, and various public buildings, including seven churches, a town-hall, a theatre, the governor's palace, convents, museums, and hospitals. The inhabitants, who numbered, in 1869, 7303, are noted for their hospitality, sobriety, industry, and general morality. They are sensitively jealous of their rights, and cling with tenacity to their territorial and legislative independence. Their chief trade is in agricultural produce and cattle.

The early history of the republic is very obscure. During the medieval wars of Italy, M. had its pigmy feuds and factions, which seem to have been none the less envenomed from the pettiness of the arena in which they were enacted. In 1740, the democratical form of government was securely guaranteed against further assault. The rights of this miniature state were scrupulously respected by Napoleon during his Italian campaign. The government, designated the Sovereign Grand Council (*Generale Consiglio Principe*), is composed of 60 members, of whom one-third are nobles. From this number are selected the smaller 'Council of Twelve' (two-thirds from the town and the rest from the country), who, with the assistance of a juriconsult, decide in questions of the 2d and 3d instance. The representatives of the state are termed Captains-regent (*Capitani Reggenti*). They are chosen, the one from the party of the nobles, the other from the bourgeoisie. They each hold office only for six months. The army, or rather the militia of the republic, numbers 1189 men.

**MARIO**, **GIUSEPPE**, **MARQUIS DE CANDIA**, was born at Turin in 1810, of an aristocratic family, and evinced from his boyhood high musical abilities. In 1830, he received his commission as officer in the Chasseurs Sardes; but having involved himself in some youthful escapade, was ordered from Genoa to a temporary retreat at Cagliari. From thence he threw up his commission, and finally escaped to Paris, on his resignation not being accepted. The young Sardinian deserter speedily won his way into the most exclusive circles of fashionable Paris, both by the genuine, manly stamp of his nature, and the charm of his exquisite voice. Having contracted debts, however, he accepted the appointment of first-tenor of the Opera, with a salary of 1500 francs per month; at the same time he changed his name from Marquis of Candia to Mario. After a term of two years' study at the Conservatoire, M. made his début, on the 2d December 1838, in *Robert le Diable*, and achieved the first of a long series of operatic triumphs. At the Théâtre Italien, he took rank with Rubini, Lablache, Malibran, Sontag, and Grisi; and by none of these great artists was he excelled in purity, sweetness, method, and taste. From 1845 to 1850, he fulfilled an engagement in Russia, and on his return appeared in London, where his success was immense. M.'s operatic career was a succession of brilliant and remunerative engagements. In his private capacity, he was esteemed for his large-handed liberality, and for his noble assistance to struggling

artists. His repertoire embraced all the great works of Rossini, Bellini, Donizetti, and Verdi. M. took farewell of the London stage in 1871.

**MARIO-LATRY** (Gr. *Maria*, and *latreia*, adoration), a name given by polemical writers to the worship paid by Roman Catholics to the Virgin Mary. This name is intended to imply that the Catholic worship of the Virgin is the supreme worship of *latreia* or adoration, which Catholics earnestly disclaim, although, from her relation to our Lord, they hold her worship, which they style *hyperdulia*, to be higher than that of all other saints. See **INVOCATION OF SAINTS**. Many examples of prayers addressed to Mary, of acts of worship done in her honour, and of expressions employed regarding her, are alleged by controversialists, for the purpose of shewing that the worship of Mary in the Roman Church is in effect 'adoration.' Such are (see Farrar's *Ecclesiastical Dictionary*, p. 372) the 'Litany of the Sacred Heart of Mary;' the adaptation of the Athanasian Creed as a profession of faith regarding her; addresses to her as the 'hope of the desponding, and refuge of the destitute;' professions that 'her Son has given her such power that whatever she wills is immediately done;' kneelings and prostrations before her image; pilgrimages in her honour. To these and similar allegations, Roman Catholics reply, that many of the objected prayers and devotional practices are entirely unauthorised by the church, and that some of them are undoubtedly liable to misinterpretation; but they further insist that all such prayers, however worded, are to be understood, and are, in fact, understood by all Roman Catholics, even ordinarily acquainted with the principles of their faith, solely as petitions for the intercession of Mary, and as expressions of reliance, not on her own power, but on the efficacy of her prayers to her Son. It would be out of place in this work to enter into such controversies, and we shall content ourselves with a brief account of the origin and nature of the worship of the Virgin Mary in the church, and of its present condition, as it is professed by those religious bodies among which the practice now prevails.

Although no trace is found in the New Testament of any actual worship of the Virgin Mary, yet Roman Catholic interpreters regard the language of the angel Gabriel, who saluted her as 'full of grace,' or highly 'favoured,' and as blessed 'among women,' and her own prediction in the canticle of the Magnificat, that 'all nations should call her blessed' (Luke i. 48), as a foreshadowing of the practice of their church; and they rely equally on the language employed by the early Fathers, as, for instance, Irenæus, regarding the Virgin, although Protestants consider it as having reference to the incarnation. But it seems quite certain that, during the first ages, the invocation of the Virgin and the other saints must have held a subordinate place in Christian worship; the reason for which, according to Roman Catholics, was probably the fear which was entertained of reintroducing among the recent converts from paganism the polytheistic notions of their former creed. But from the time of the triumph of Christianity in the 4th c., the traces of it become more apparent. St Gregory Nazianzen, in his panegyric of the virgin martyr Justina, tells, that in her hour of peril she 'implored Mary the Virgin to come to the aid of a virgin in her danger' (Opp. tome i. pp. 278, 279). St Ephraim, the Syrian, in the same age, uses language which is held by Roman Catholics to be equally favourable to their view; and the fact that about this time there arose a sect, the Collyridians, who were condemned for the actual adoration of the Virgin, seems to them to prove

that some worship of her must have existed in the church, out of which this excessive worship of the Collyridians grew. But it was only after the heresy of Nestorius that the worship of Mary seems to have obtained its full development. His denial to her of the character of mother of God, and the solemn affirmation of that character by the ecumenical council of Ephesus (430 A.D.), had the effect at once of quickening the devotion of the people, and drawing forth a more marked manifestation on the part of the church of the belief which had been called into question. The 5th and 6th centuries, both in the East and in the West, exhibit clear evidence of the practice; and the writers of each succeeding age till the Reformation speak with gradually increasing enthusiasm of the privileges of the Virgin Mary, and of the efficacy of her functions as a mediator with her Son. St Bernard, and, still more, St Bonaventura, carried this devotional enthusiasm to its greatest height; and the popular feeling found a stronger and still more strong manifestation in the public worship of the church. From a very early period, we find several festivals of the 'blessed Virgin;' but in the centuries to which we refer, the number received large additions. The institution of the 'Rosary of the Virgin Mary,' the appointment of a special office in her honour, and more than all, the fame of many of the sanctuaries which were held to be especially sacred to her worship, gave a prominence to the devotion which Protestants find it difficult to reconcile with the honour which they hold due to God alone.

The chief festivals of the Virgin, common to the Western and Eastern Churches, are the Conception, the Nativity, the Purification, the Annunciation, the Visitation, and the Assumption. All these festivals are retained in the English calendar. The Roman Church has several special festivals, with appropriate offices—all, however, of minor solemnity.

**MARIONETTES**, little jointed puppets of wood or cardboard, representing men and women, and moved by means of cords or springs by a concealed agent. They are exhibited in what are called marionette theatres, the exhibitor varying his voice, so that a sort of dramatic performance is accomplished. This entertainment was known to the Greeks, and from them passed to the Romans. In modern times, it has chiefly prevailed in France and Italy, and has there reached a very respectable degree of artistic perfection.

**MARIOTTE**, EDMÉ, a distinguished French natural philosopher, was born in Burgundy during the first half of the 17th c., and was the prior of St Martin-sous-Beaune, when the Academy of Sciences admitted him within its pale in 1666. His life is devoid of particular interest, having been almost wholly spent in his cabinet, among his books and instruments. He died in 1684. M.'s forte consisted in an extraordinary power of drawing conclusions from experiment. He repeated Pascal's experiments on gravitation, and detected some peculiarities which had escaped that ingenious philosopher; confirmed Galileo's theory of motion; enriched hydraulics with a multitude of discoveries, and finally made a thorough investigation into the subject of the conduction of water, and calculated the strength necessary for pipes under different circumstances. His collected works were published at Leyden in 1717, and at the Hague (2 vols. 4to) in 1740. His *Traité du Mouvement des Eaux* was published by La Hire (Paris, 1786, 12mo).

**MARIOTTE**, LAW OF, an empirical law deduced by Boyle (q.v.) and Mariotte (q.v.) from two independent series of experiments, though, strangely enough, reached by both at about the same time; it

is generally expressed as follows: *The temperature remaining the same, the volume of a given mass of gas is in inverse ratio to the pressure which it sustains.* This law may be held to be substantially correct within a considerable range of pressure. But the labours of Regnault have made it evident that atmospheric air and most other gases, especially under very high pressures, are really more compressed than if they followed the law. This deviation is most marked in the case of gases capable of being liquefied, as they approach the point of liquefaction.

**MARITZA** (the anc. *Hebrus*), a river of European Turkey, in the province of Rumili, takes its rise in lat. 42° N., long. 24° E., and flows east-south-east to Adrianople, where it bends south, and falls into the *Ægean* by the Gulf of Enos. It is upwards of 300 miles in length, and is navigable to Adrianople, about 100 miles from its mouth.

**MARIU'POL**, or **MARIAMPOL**, a seaport in the government of Ekaterinoslav, Russia, is situated near the place where the Kalmius falls into the Sea of Azov, 60 miles west of Taganrog. It was founded in 1779 by Greek emigrants from the Crimea, and the port was opened to foreign vessels in 1836, when 20 ships entered it; but by 1853 their number had increased to 309. The articles of export are wheat, linseed, wool, and hides from the adjacent provinces, the total value in 1853 being £500,000. The imports are insignificant, ships most commonly arriving in ballast. Pop. 7760, who speak a corrupt jargon derived from the Turkish and Greek languages.

**MARIUS**, C., a Roman general, was born of an obscure family, at the village of Cereata, near Arpinum, 157 B.C. In the Numantine war (134 B.C.), he served with great distinction under the younger Scipio Africanus, who treated him with high consideration, and even indicated that he thought him a fit successor to himself. In 119 B.C., he was elected tribune of the plebs, and signalled himself by his vigorous opposition to the nobles, by whom he was intensely hated. In 114 B.C., he went to Spain as propretor, and cleared the country of the robbers who infested it. He now married Julia, the aunt of Julius Caesar. He accompanied Q. Cæcilius Metellus to Africa in 109 B.C., was elected consul two years after, and intrusted with the conduct of the Jugurthian war, which he brought to a successful close in the beginning of 106 B.C. From this period dates the jealousy between him and L. Sulla, then his quaestor, which was ultimately productive of so many horrors. Meanwhile, an immense horde of Cimbri, Teutones, and other northern barbarians, had burst into Gaul, and repeatedly defeated the Roman forces with great slaughter. M. was again called to the consulate for the year 104 B.C., and for the third, fourth, and fifth time in the following years, 103—101 B.C., for it was felt that he alone could save the republic. The war against the Teutones in Transalpine Gaul occupied him for more than two years; but he finally annihilated them in a battle of two days' duration at Aquæ Sextiæ, now Aix, in Provence, where 200,000—according to others, 100,000—Teutones were slain. After this, he assumed the chief command in the north of Italy against the Cimbri (q.v.), whom he also overthrew, near Vercellæ to the west of Milan, with a like destruction (101 B.C.). The people of Rome knew no bounds to their joy. M. was declared the saviour of the state, the third founder of Rome, and his name was mentioned along with those of the gods at banquets. He was made consul for the sixth time in 100 B.C. It has often been remarked, that, had he died at this period, he would have left behind

## MARKETS—MARLBOROUGH.

from such purchaser, till he has prosecuted the thief.—In Scotland, the real owner can reclaim the goods at any time, whether in the meantime sold in open market or not.

**MARKETS.** See **FAIRS.**

**MARL** (Ger. *Mergel*), a mixture, naturally existing, of clay and carbonate of lime, often also containing sand and other substances. Marls are found in very different geological formations, but everywhere seem to owe their origin to deposition by water. The name is sometimes applied to friable clays, or mixtures of clay and sand, in which there is almost no trace of lime; but the presence of a notable proportion of carbonate of lime is essential to marls, properly so called. This proportion varies from 6 to 20 per cent. Marly soils are in general of great natural fertility. Marl is very advantageously used as a manure, acting both chemically and mechanically; but different kinds of marl are of very different value in this respect. The use of marl as a manure has been known from ancient times. An English statute of 1225 (10 Henry III.) gave every man a right to sink a marl-pit on his own ground, and there is other evidence that the application of marl to land was common in England in the 13th century. Old marl-pits are very common in some parts of England. The quicker action and greater efficiency of lime have led to its use in many cases instead of marl, although some kinds of marl are extremely useful in some soils. The bulkiness of marl confines its use to the neighbourhood in which it is found.—Marl is sometimes indurated into a rock, and a slaty variety, containing much bitumen (*Bituminous Marl-slate*), is found in Germany and other countries.

**MARLBOROUGH**, an old and interesting town of England, Wiltshire, is a municipal and parliamentary borough, pleasantly situated in the valley of the Kennet, 75 miles west-south-west of London. It consists principally of one street, of picturesque houses. The chief edifice is the 'college,' a handsome building, occupying the site of the old castle. As early as the days of Cœur-de-Lion, there was a castle at M.; and a parliament, whose enactments were called the 'Statutes of Marlborough,' was held here in the reign of Henry III. In the beginning of the 18th c., the castle was the residence of the Earl and Countess of Hertford, who occasionally entertained Thomson and Pope, and other men of letters here. The college was incorporated in 1845; the pupils are about 300 in number. M. was formerly an important posting-station between London and Bath and Bristol. It still carries on a trade in coal, corn, and malt. Population (1871) of parliamentary borough, which returns one member to the House of Commons, 5034.

**MARLBOROUGH, JOHN CHURCHILL, DUKE OF**, the greatest general and statesman of his time, was born 24th June 1650, at Ashe, in Devonshire, of an old family impoverished by the civil wars. Without having received much education, he became a page in the service of the Duke of York, who gave him a commission as an ensign of Guards in his 16th year. He was present at the relief of Tangiers, and a number of engagements with the Moors, and after his return to England, rose to the rank of captain in a regiment which was sent to the Netherlands to the support of the French. In the campaign from 1672 to 1677, his brilliant courage and ability gained him the praise of the celebrated Turenne. On the conclusion of the war by the peace of Nimeguen, Churchill, now a colonel, returned to England. His advancement had been obtained, not merely on account of his own merit, but through the influence

of his sister, Arabella, mistress of the Duke of York. His prosperity was afterwards still further secured by his marriage with Sarah Jennings, a lady as remarkable for her talents and industry as for her beauty. When James II. ascended the throne, Churchill was made Baron Sundridge, and was raised to the military rank of general. He took an active part in suppressing the Jacobite rebellion, but on the landing of James II. at Orange, he passed over to the side of the king very unscrupulously. He was rewarded by being made Earl of Marlborough. He aided in reducing Ireland to subjection; and having received from William III. the command of the troops employed against France in the Netherlands, displayed great ability as a general in the campaigns of 1690 and 1691, and gained a great victory at Walcourt, entering into a treasonable correspondence with the Jacobites, he was, on his return to England, suddenly arrested and thrown into the Tower. At the commencement of the War of the Spanish Succession, he was intrusted with the command of the English army in the Netherlands. The death of William III. and the accession of Anne to the throne in 1702, made M. virtually regent, although he never assumed the title. His wife governed the queen, and himself directed the minister Godolphin, who married his daughter. A constant succession of victories strengthened his political power. In the campaign of 1702, he drove the French out of Spanish Guelders, in reward for which services the queen raised him to the rank of duke; in 1703, he went to the support of the Emperor in Germany, joined Prince Eugene of Savoy; in June 1704, he stormed the French and Bavarian lines at Blenheim, and on 13th August overthrew the French in the memorable and decisive battle of Blenheim. The parliament bestowed on him the estate of Woodstock, and the queen caused Blenheim Palace to be built for him. During the year 1705, M. was occupied with diplomatic negotiations; but in 1706 he resumed that career of victory by which Marlborough XIV. was so completely humbled. In May 1706, the battle of Ramillies was fought, which compelled the French to evacuate the whole of the Netherlands. In the summer of 1708, an attempt was made by the French, under Vendôme, to recover Flanders, which brought on an engagement at Oudenarde, which resulted in the total defeat of the French. On 11th September 1709, he fought the bloody but unprofitable battle of Malplaquet; in 1710, in the campaign, he took from the French town after town, sometimes in the very sight of a superior French army. Meanwhile, however, important events were taking place at the British court: the queen shook off the tyranny of the Duchess of Marlborough, who had become intolerable to her; Godolphin and St. John ceased to be ministers, and the Earl of Bolingbroke and the Tories came into power. M. returned to London in May 1711. He was accused of having embezzled the public money, and on 1st June 1712 he was deprived of his offices, but the charges against him were not prosecuted. On the accession of George I., he was treated with distinction, and made Commander-in-chief of the Forces. On 8th June 1716, he had a stroke of apoplexy, which reduced him to a state of imbecility. He lived in this state till 17th June 1722, when he died, leaving an immense fortune.

Macaulay and Thackeray have united in painting M. as a cold-blooded, scheming traitor; and although general opinion has not yet endorsed the views of these writers, there is too much evidence to show that he thought more of his own interest than of any cause in which he was engaged.

His wife, SARAH JENNINGS, was born on 22nd

and when about 12 years of age came into the possession of the Duchess of York, and became the most intimate friend of the Princess, over whom, after her accession to the throne, she exercised the influence due to a superior and actively active mind. Her power was almost endless, the Whig ministry depended upon her support, and she disposed of places and offices at pleasure, and is even said to have accumulated property by the sale of them. Her rule was, however, so means gentle, and became at last intolerable to the queen, in whose favour her own cousin, Lady Ham, whom she had herself brought to court, plotted her. She retired from the court in early 1711, and at the same time a change of ministry took place. She long survived her husband, and in complete retirement, and died on 29th March 1744, leaving a fortune of £3,000,000 sterling. She only son of the Duke and Duchess of Marlborough died young, and the title has been inherited by the descendants of one of their daughters.

**MARLINE-SPIKE**, a ponderous iron pin, with a large head and taper point, used on shipboard for separating the strands of rope preparatory to tarring or knotting; also employed as a lever in tarring rigging, &c.

**MARLOW, GREAT.** See **GREAT MARLOW.**

**MARLOWE, CHRISTOPHER**, familiarly *Kit*, an English dramatic writer, was born, it is supposed, 1565. But little is known of the events of his life.

He studied at Corpus Christi College, Cambridge, and took the degree of Master of Arts in 1584. After leaving the university, he came up to London, and wrote for the stage. His chief works are *Dr Faustus*, *Edward II.*, *Tamburlaine the Great*, two cantos of *Hero and Leander*, a narrative in which was afterwards completed by Chapman. He appears to have led a reckless life; and on the June 1593, he perished in a tavern brawl, it is supposed by the hand of a jealous rival.

Of all the dramatic writers before Shakespeare, he is the greatest genius; indeed, his *Edward II.* may be considered a foreshadow of Shakespeare's historical dramas. His 'mighty line' has been the object of much critical laudation. His imaginative power and splendour are at their best in *Faustus*; his delicacy and sweetness in *Hero and Leander*. A new edition of his works, with a Life and a literary-critical Introduction, was published by Dyce in 1839.

**MARMALADE** (Port. *marmelada*, from *marmelo*, since; which, again, is from Mid. Lat. *malomellum*, *melimelon*, honey-apple or sweet apple) is a liquid preserve, made by boiling the pulp of the rinded fruits, such as oranges, pine-apples, lemons, &c., with portions of the rind. The most common kind of marmalade is made from the bitter Seville oranges, the common or sweet sorts being considered inferior for this purpose, though also occasionally used. The mode of preparing it is generally as follows: the rind is boiled by itself, the white woolly coating on the interior being removed, the rind is cut up into thin strips, and boiled along with the expressed juice of the pulp and a quantity of sugar equal in weight to the other ingredients. After the mixture has attained the proper consistence, it is treated in a similar manner to jam, jelly, and other preserves. A species of marmalade is commonly made in France from apricots, peaches, plums, pears, &c.

**MARMANDE**, an old town of France, in the department of Lot-et-Garonne, on the right bank of the Garonne, 50 miles above Bordeaux. An important general trade is carried on with Bordeaux,

with which M. is in daily communication by steam-boat. Pop. (1872) 5417, who manufacture hats, woollen stuffs, brandy, &c.

**MARMONT, AUGUSTE FRÉDÉRIC LOUIS VIESSE DE**, Duke of Ragusa and Marshal of France, was born 20th July 1774, at Châtillon-sur-Seine, entered the army at an early age, served as a brigadier-general in Egypt, returned with Bonaparte to France, supported him in the revolution of the 18th Brumaire, and afterwards continued in active military service. Having defended the Ragusan territory against the Russians and Montenegrins, he was made Duke of Ragusa. He joined the great army in 1809, the day before the battle of Wagram, was intrusted with the pursuit of the enemy, won the battle of Znaim, and was made a marshal. He was thereafter for eighteen months governor of the Illyrian provinces; and in 1811 succeeded Massena in the chief command in Portugal, where he assumed the offensive, caused the siege of Badajoz to be raised, and kept Wellington in check for fifteen months. A wound compelled him to retire to France. In 1813, he commanded a *corps d'armée*, and fought at Lützen, Bautzen, and Dresden. He maintained the contest with great spirit in France in the beginning of 1814; and it was not until further resistance was hopeless, that he concluded a truce with Barclay de Tolly, on which Napoleon found himself compelled to abdicate. The Bourbons loaded M. with honours. On the return of Napoleon from Elba, he was obliged to flee. After the second restoration, he spent much of his time in agricultural pursuits, till the revolution of 1830, when, at the head of a body of troops, he endeavoured to reduce Paris to submission, and finally retreating with 6000 Swiss, and a few battalions that had continued faithful to Charles X., conducted him across the frontier. From that time, he resided chiefly in Vienna. In 1852, he engaged in an effort for the fusion of the French Legitimists and Orleanists, but died at Venice on 2d March of that year. He was the last survivor of the marshals of the first French Empire.

**MARMONTEL, JEAN FRANÇOIS**, an elegant French writer, born of an obscure family at Bort, in the Limousin, 11th July 1723. He studied for the church, but turned aside to literature, and after obtaining some reputation in Toulouse as a poet, he went to Paris on an invitation from Voltaire in 1746. Here he wrote tragedies and operas without any great success, but was fortunate enough to get a secretaryship at Versailles, through the influence of Madame Pompadour, in 1753. Afterwards, he received a more lucrative appointment, the *Mercure* being intrusted to his charge. His *Contes Moraux* (2 vols. Par. 1761), part of which originally appeared in the *Mercure*, have been translated into many languages, but are in some measure liable to the charge of monotony. He wrote other works, the most celebrated of which is his *Bélisaire*, a political romance, containing a chapter on *toleration*, which excited the most furious hostility on the part of the doctors of the Sorbonne. The book was condemned as 'heretical and blasphemous.' The clergy declaimed against it from the pulpits; the city was in a ferment; even the wise Turgot was borne away by the current. Pamphlets, epigrams, caricatures appeared in great numbers. There was a dead set-to between the philosophers and wits on the one hand, and the theologians on the other; but the latter were defeated, and M. was named historiographer of France. In 1787, appeared his *Eléments de Littérature*, consisting of his contributions to the *Encyclopédie*, in which he had charge of the departments of poetry and general literature. It is really

## MARMORA—MARNE.

his best book, and the one on which his reputation most securely rests. After the Revolution, he retired to the village of Abloville, near Evreux, where he died, 31st December 1799. An edition of his *Œuvres Complètes* was published by himself in 17 vols.; another, 18 vols. (Par. 1818); a third, 7 vols. (Par. 1819—1820).

**MARMORA**, THE SEA OF, the *Propontis* of the ancients, a small sea between European and Asiatic Turkey, communicating with the *Ægean* Sea by the Strait of the Dardanelles (anciently *Hellespont*), and with the Black Sea by the Strait of Constantinople (anciently *Bosporus*). It is of an oval form, and about 135 miles in length by 45 in breadth, but has besides a large gulf, the Gulf of Isnikmid or Ismid, which extends about 30 miles eastwards into Asia. The depth is great. There is a current from the Bosphorus through it and the Hellespont to the Archipelago; but its navigation is by no means difficult. It contains many islands, of which the largest is Marmora or Marmara, famous for its quarries of marble and alabaster. The scenery around the Sea of M. is soft and beautiful.

**MARMOSET**, a name often given to a number of small and beautiful species of American monkeys of the genera *Hapale* and *Jacchus*, also called *OUTISTITI*, and sometimes also to species of the genus *Midas* of naturalists. They are all distinguished from the other American monkeys by the smaller number of their grinders, resembling in this the monkeys of the Old World, also by the sharpness and crookedness of their nails. They depart from the true quadrumanous character in having the thumb not opposable. The tail is very long, and thickly covered with hair, but not prehensile. They exhibit a very affectionate disposition; but

Marmoset, or Striated Monkey (*Hapale Jacchus*).

unhappily all of them prove very delicate when removed from a warm climate. The name M. is sometimes restricted to the species also called the **STRIATED MONKEY**, or **STRIATED OUTISTITI** (*Hapale Jacchus*, or *Jacchus vulgaris*), a native of Guiana and Brazil, a species often brought to Europe, and a favourite pet whenever it can be obtained. It is about seven or eight inches long, exclusive of the tail, which measures a foot. Its fur is long and soft, of a fine dark gray or reddish-yellow colour, banded with black; a long tuft of white hairs on each side of the black head.

**MARMOT** (*Arctomys*), a genus of rodents, usually ranked among the *Muridae*, but regarded as forming a connecting link between that family

and *Sciuridae*; resembling squirrels in their form and habits, although in their form and habits they resemble rats and mice. They have two, and two premolars in each jaw, four on each side above, and three below.—The Common ALPINE M. (*A. alpinus*), is a native of the Pyrenees, and the more northern mountains of Europe, up to the limits of perpetual snow, not a native of Britain. It is about the size of a rabbit, grayish yellow, brown towards the back

Marmot (*Arctomys alpinus*).

feeds on roots, leaves, insects, &c. It is gregarious and often lives in large societies. It digs burrows with several chambers and two entrances, generally on the slopes of the mountains, where marmots may be seen sporting and basking in sunshine during the fine weather of summer. They spend the winter in their burrows, in one of which is a store of dried grass; but the part of the winter is passed in torpidity. Alpine M. is easily tamed.—The QUEBEC M. (*empetra*), found in Canada and the more northern parts of America, in woody districts, is a burrowing but not a gregarious animal.

**MARNE**, a river of France, the *Matrona* of the ancients, the most considerable tributary of the Seine, on the right. It rises in the plain of Langres, flows through the departments of Marne, Marne, Aisne, and Seine-et-Marne, takes its course at first to the north-west, and then to the west, with many windings; passes Chaumont, Vitry, Châlons, Epernay, Châlons, and Meaux; and joins the Seine at Paris, about four miles above Paris. Its length is about 205 miles, and it is navigable for 140 miles. It is rather a rapid stream, and in most places has a wide bed. The commerce carried on upon the river has been extended by means of canals, the most important of which is one completed in 1825, connecting it with the Rhine.

**MARNE**, an inland department in the north-east of France, formed out of the old province of Champagne, is traversed by the river Marne, and extends southward from the frontier of the department of Ardennes. Area, 2,021,488 English acres, of which 1,519,320 are cultivable, and 1,000,000 are in vineyards. Pop. (1872) 386,157. The soil is very fertile in the south, but chalky and barren in the north. It is in the dry and chalky soil of the north of this department where the best vineyards of the famous Champagne Wine (q.v.) are produced. Of wines of all kinds, about 15,400,000 gallons are produced in this department annually. The raising of a Spanish breed of sheep is a chief branch of industry, and woollen manufactures are carried on. The department is divided into five arrondissements of Châlons-sur-Marne, Reims, Sainte-Ménéhould, Vitry-le-François, and Châlons-sur-Marne. Capital, Châlons-sur-Marne.

## MARNE—MARQUE.

NE, HAUTE, an inland department in the east of France, south-east of the department of Aisne. Area, 1,545,460 acres; pop. (1872) 251,196. The face is generally hilly, and is mountainous in the south and east. More than one-half of its surface is covered by forests. The principal rivers are the Marne, with its tributaries, the Aisne and the Meuse. About 13,000,000 gallons of wine of an ordinary quality are produced. The soil is rich in iron ore; there are numerous mines, and the production of iron is the principal industry. There are three arrondissements: Chaumont, Langres, and Vassy; capital, Reims-en-Bassigny.

OCCO. See MOROCCO.

OCCHETTI, BARON, CARLO, Chevalier of the Order of Honour, an Italian sculptor of merit, born in Turin in 1805. Having completed his studies at the Lyceum Napoléon, he entered the army. On the completion of a tour through Italy he took up his abode in France in 1827, and was awarded a medal the same year for his beautiful statue of 'A Young Girl sporting with a Dog.' In 1830 he exhibited the 'Fallen Angel.' On the outbreak of the Paris revolution of 1848, M. repaired to London, where he continued to reside, having met with the most encouraging patronage from the public and the aristocracy. Among his works are an equestrian statue of Emmanuel, executed gratuitously for the city of Paris; the tomb of Bellini, in Père la Chaise; the altar in the Madeleine at Paris; statues of Napoleon III., the Duke of Orleans, and Queen Victoria; the colossal figure of Richard Coeur-de-Lion at the portal of the Crystal Palace. His latest work is a statue of Lord Clyde in the Albert Place, London. He died in 1867.

MONITES, a Christian tribe of Syria, of very ancient origin. Considerable controversy has arisen as to their primitive history: the most probable opinion represents them as descendants of a remnant of the MONOTHEIST sect (q.v.), who, fleeing from the oppressive measures of the Emperor Anastasius in the early part of the 5th c., settled on the eastern slopes of the Lebanon, their chief seats being around the monastery of Maron, a saint of the 5th c., whose name is recorded in Theodoret's *Religious Histories* (iii.).

The emigrants are said to have elected as their chief and patriarch a monk of the same name, the title of Patriarch of Antioch, and, throughout the various vicissitudes of the succeeding centuries, maintained themselves in a certain independence among the Moslem conquerors. In the 12th c. the establishment of the Latin kingdom of Jerusalem, the M. abandoned their distinctive monarchical opinions, and recognised the authority of the Roman Church. Again, in the Council of Florence, they entered into a formal act of union with the papacy. In 1584, a college was founded in Rome for the education of the Maronite clergy; and in 1736, the pope formally subscribed the decrees of the Council of Trent. Nevertheless, although united with Rome, the M. are permitted to retain their distinctive national customs and usages. They administer communion in the ancient Syriac language; their clergy, if married before ordination, are permitted to retain their wives; they have many festivals and saints not recognised in the Roman calendar. The M. at present amount to 150,000 in number, distributed into 150 parishes. Their patriarch is still styled Patriarch of Antioch, and resides in the convent of Canobin on the eastern slopes of the Lebanon. He acknowledges the supremacy of the pope, and is bound to lay before him every tenth report of the state of his patriarchate. Under

him are 17 bishops, to whom are subject the officiating clergy of the 150 districts alluded to above. The revenues of all orders of ecclesiastics, however, are very narrow, and the inferior clergy live in great measure by the labour of their hands. Very many convents for both sexes are spread over the country, containing, in the whole, from 20,000 to 25,000 members, who all wear a distinctive costume, but follow the rule of St Anthony. The chief seat of the M. is the district called Kesrawan, on the western declivity of Mount Lebanon; but they are to be found scattered over the whole territory of the Lebanon, and in all the towns and larger villages towards the north in the direction of Aleppo, and southwards as far as Nazareth. Their political constitution is a kind of military republic, regulated for the most part by ancient usages and by unwritten, but well-recognised laws. Like the Arabs of Syria, they have a political hierarchy, partly hereditary, partly elective. The chief administration is vested in four superior sheiks, who possess a sort of patriarchal authority, and under these are subordinate chiefs, with whom, as in the feudal system, the people hold a military tenure. They retain even still a custom similar to that of the Sardinian *vendetta*, by which the kindred of the slain are bound to avenge his death. The relations of the M. with the Druses have been already detailed. See DRUSES. By an arrangement adopted since the recent sanguinary conflicts, both populations alike are subject to one governor, who is appointed by the Porte as governor of the Lebanon.

MAROO'NS, a name given in Jamaica and Dutch Guiana to runaway negro slaves. The term was first applied to those slaves who were deserted by their masters, the Spaniards, when the British conquered Jamaica (1655), and who took refuge in the uplands, where for 140 years they maintained a constant warfare with the British colonists; but in 1795 they were subdued, and a portion of them removed to Nova Scotia, and afterwards to Sierra Leone. The remnant fraternised with their manumitted brethren in 1834—1835. The M. of Dutch Guiana form a number of small independent communities.

MAROS-VASARHE'LY, a market-town of Austria, in Transylvania, in a fruitful district, on the Maros, 55 miles north-north-east of Hermannstadt. It contains a strong castle, a beautiful Gothic church (Reformed), and a public library of 60,000 volumes. Tobacco, wine, and fruit are extensively grown. Pop. (1869) 12,678.

MAROZIA, a Roman lady of noble birth, but of infamous reputation in the scandalous chronicles of her age, daughter of the equally notorious Theodora, was born in the close of the 9th century. On the dissolution of all the moral ties of public and private life which the war of factions occasioned in Rome in the 10th c., M., by her beauty and her intrigues, contrived to exercise great influence. She was married three times, and, if we may credit the narrative of Luitprand, had skill and address enough to procure the deposition and death of the pope, John X., and the elevation of her son, the fruit, it is alleged, of adulterous intercourse, to the pontificate, under the name of John XI. This, however, rests on the testimony of Luitprand, who wrote some time after the period, and whose authority is considered more than doubtful, not merely by Muratori, but even by so critical and unbiassed a writer as Dr Pertz. M.'s latter years brought on her the punishment of her crimes. She died in prison at Rome in 938.

MARQUE, LETTERS OF. See LETTERS OF MARQUE.

## MARQUESAS ISLES—MARRIAGE.

**MARQUESAS ISLES** are, properly speaking, the southern group of the Mendaña Archipelago, in Polynesia, the northern group bearing the name of the Washington Islands; but the name is also applied to the whole archipelago. The M. I., in lat.  $7^{\circ} 30' - 10^{\circ} 30' S.$ , long.  $138^{\circ} - 140^{\circ} 20' W.$ , were discovered by Mendaña de Neyra, a Spanish navigator, in 1596; the Washington Isles were discovered in 1791 by Ingraham, an American. Area of the group as under the French protectorate, 500 English square miles; pop. 20,000. The M. I. were named after the viceroy of Peru, Marquesas de Mendoza. The islands are of volcanic origin, and are in general covered with mountains, rising in some cases to about 3500 feet above sea-level; the soil is rich and fertile, and the climate hot, but healthy. The coasts are difficult of access, on account of the surrounding reefs and the sudden changes of the wind. Cocoa-nut, bread-fruit, and papaw trees are grown, and bananas, plantains, and sugar-cane are cultivated. The inhabitants are of the same race as those of the Society and Sandwich Islands. They are well proportioned and handsome, but degraded in their religion and in many of their customs. On some of the islands, there are missionary stations; but although cannibalism has been abolished, the efforts of the missionaries have not otherwise met with much success. In 1842, the M. I. submitted to the French, and they are now governed by independent chiefs, under the protectorate of France.

**MARQUETRY** (Fr. *marqueterie*), the art of inlaying wood with wood of other colours, or with various other materials, as metal, ivory, shell, &c. The marquetry of Italy, especially that called Sorrento work, stands very high in artistic merit, and that of Würtemberg is perhaps the cheapest made. Not only are all kinds of coloured woods used for producing the patterns in this kind of work, but artificial colours are given to poplar, willow, and other white woods, to increase the effect. The cabinet-makers of France, Belgium, and Germany are famous for the beautiful marquetry furniture they manufacture.

**MARQUIS**, or **MARQUESS**, the degree of nobility which in the peerage of England ranks next to duke. Marquises were originally commanders on the borders or frontiers of countries, or on the sea-coast, which they were bound to protect. In England, the title of marquis was used in this sense as early as the reign of Henry III., when there were marquises or lords-marchers of the borders of Scotland and Wales; and the foreign equivalent of *Markgraf* was common on the continent. But the marquise eventually became honorary, no specific duty being attached to it. The first English marquis in the modern sense was Robert de Vere, Earl of Oxford, who was created Marquis of Dublin by Richard II., to the no small offence of the earls who had to yield him precedence. In 1397, the same king made John Beaufort, Earl of Somerset, Marquis of Dorset, a title which was taken from him in the next reign. The House of Commons petitioned that his marquise should be restored, but he himself requested that it might not, being an innovation. No marquises are mentioned in England from this time for a century and a half. The oldest existing marquise is that of Winchester, created by Edward VI. in 1551. The title was first introduced into Scotland in 1599, when the Marquises of Huntly and Hamilton were created. After the Revolution, it became the practice to bestow a marquise as a second title in conferring a dukedom.

The coronet of a marquis, as worn in the United Kingdom, is a circle of gold, with four strawberry leaves (or oak leaves), and as many pearls alternating with them, and placed on pyramidal points of the same height with the leaves. The mantle is scarlet, with three and a half doublings of ermine. A marquis is styled 'The Most Honourable'; his wife is a marchioness; his eldest son takes by courtesy the next lower title in the peerage, except where that is identical with the title of the marquise, in which case he must take the next lower still, as in the case of the Marquis and Earl of Salisbury, whose eldest son bears the courtesy-title of Viscount Cranborne. The younger sons of a marquis are styled 'Lord,' and daughters 'Lady,' with the addition of Christian name and surname.

Marquis's Coronet.

**MARRIAGE**, the union of a man and woman in the legal relation of husband and wife. No two systems of laws are exactly agreed either as to the modes of constituting marriage, the rights which it confers, or the obligations which it imposes. It is one of the leading bases of law, and it is probable that around it laws first began to grow. In some places the old names for 'law' and 'marriage' are interchangeable, and everywhere the institution of marriage equally with that of laws had been ascribed to the first rulers. It accords, however, with historical inquiry and reasoning *a priori*, that they were not the invention of legislators, but growths from the experience and necessities of society, which could not advance far without rules for the appropriation of men and women to one another, securing them in the enjoyment of one another's society, and defining their obligations to their progeny. But while experience and necessity everywhere led to the institution of marriage, the forms of the institution were exceedingly various. The broadest differences between the institutions in different localities are indicated by the words monogamy and polygamy, the latter including polygyny and polyandria. Monogamy, the rule among the most advanced nations, is the practice, on the whole, of mankind. Polygamy is *per se* merely. It has been doubted whether polyandria—i.e., the system according to which a woman may have several husbands—exists; but the fact seems to be well established. Of all the modes of getting a wife were the same with those of acquiring any other species of property—capture, gift, sale. The contract of sale may be said to be at the foundation of the marriage relation in every system of ancient law. When daughters belonged to fathers as goods, they were parted with only on the principles of fair exchange. Usually the contract was between the heads of families, the intending bride and bridegroom not being consulted. As to the marriage ceremonies, they then were those and no other which were necessary to complete and evidence a sale—delivery, on the price being paid, and 'the taking home.' It consisted with the growth of civility that the children should in time come to be consulted, and allowed to act on their likings. Now, among all civilised communities marriage is a civil contract between the parties themselves, constituted by their consent properly evidenced. The Church of Rome indeed regards it as a sacrament, and throughout Christendom marriage is usually attended by religious rites; but in the eye of the law, it is a simple civil contract, 'evidenced in words prescribed by law, or by law counted sufficient.' See *DIVORCE*; *Montesquieu's Spirit of Laws*; *Goquet's Origin of Laws*; and

## MARRIAGE.

*Laine's Ancient Law.* Subjoined are accounts of the modes of constituting marriage in England, Scotland, and Ireland.—For the legal effects of entering into marriage as regards the persons and property of the married parties, see HUSBAND AND WIFE.

*England.*—Marriage is considered in England as merely a civil contract, but the contract can be entered into only in certain ways, this restriction being intended to enforce some caution and deliberation in the parties, as well as to preserve evidence of the fact which may be easily accessible afterwards. Before stating what forms are necessary, it may be observed that as marriage is merely a contract between two persons, it follows that an action will lie for breach of a promise to marry at the instance of either party, and damages may be recovered accordingly. A promise to marry may be made either verbally or in writing; and in actions for breach of the promise it is for a jury to assess the damages which are appropriate to the relative situation and conduct of the parties, the usual evidence of the promise being acts of courtship, love-letters, and the observation of friends and acquaintances. The contract of marriage differs from other contracts in this, that it will not be set aside and treated as null merely because either party procured it by fraudulent representations. However much either party may have been deceived as to representations of the other's wealth, position, prospects, the contract remains valid notwithstanding. Another particular in which the contract of marriage differs from other contracts is, that it cannot be rescinded by either party or both at pleasure, though that effect is brought about in another way by certain kinds of misconduct, whether studied or not, of either party. See DIVORCE, JUDICIAL SEPARATION. Another circumstance in which marriage differs from other contracts is, that it cannot be entered into in a moment, but certain preliminary notices must be given, and forms gone through. By the ancient common law of England, mere consent was enough to constitute marriage, as it is still in Scotland; but since Lord Hardwick's Act, in 1757, a ceremony in an established church was made necessary, and this continued till 1836, when the dissenters succeeded in removing this exclusiveness. Persons have now the option of two forms of contracting marriage: it may be with or without a religious ceremony; and if with a religious ceremony, it may be either in the established church, or in a dissenting chapel. If the marriage is to take place in an established church, then there must be either publication of bans of marriage for three preceding successive Sundays, or a licence or certificate obtained, which dispenses with such publication; and in either case, seven or fifteen days' previous residence in the parish by one of the parties is necessary, according as it is a certificate or licence respectively which is applied for. If the marriage must take place in the church, the marriage service of the Church of England being read over, and this must be done in canonical hours—i. e., between 8 and 12 A. M., in presence of two witnesses. If the marriage is celebrated in a dissenting chapel (and for that purpose such chapel must be duly licensed and registered), there must be present the superintendent-registrar of the district as one of the witnesses, but the dissenting clergyman may use his own or any kind of form of service. If the marriage is not to be with any religious ceremony, then it must take place in the office of the superintendent-registrar, and in presence of witnesses, the essential thing being that both parties should in the presence of witnesses there exchange a declaration that they take

each other for man and wife. The canonical hours must be attended to in all cases, and the condition of previous residence by one of the parties in the district; but the condition of residence is often evaded. And in all cases the fact of the marriage must be entered in a register, which register is kept by a public officer, and ultimately filed and kept in Somerset House, London, where a copy of the certificate of registration of every marriage in England can at all times be had for a small sum. There is no fixed age at which parties are not allowed to marry, provided the male is above 14, and the female above 12; and though it is usual in England to say that an infant—that is, a person under 21 years of age—cannot marry without his or her guardian's consent, this is not correct, for infants can marry like other persons, without anybody's consent; the only consequence that can happen is, that they may incur penalties for perjury, and the property, if any, may be ordered by the Court of Chancery to be settled in a particular way, but the marriage nevertheless remains good. Though marriage thus consists essentially of forms as well as of free consent of parties, still, it may sometimes happen that persons go through the form of marriage, and yet are not married, owing to some illegality or fundamental condition being wanting; thus, a common instance of a form of marriage being utterly useless is where one of the parties is already married, the spouse being alive. In such case, it is quite immaterial whether the party so re-marrying is really ignorant, or affects to be so, that his or her spouse is alive, provided such is the fact; for though, after seven years, if nothing has been heard of one of two married parties being alive, the other will escape the penalties of bigamy on marrying again, yet it depends entirely on whether the first spouse is really dead at the time, whether the second marriage is valid. Another case in which parties may go through the form of marriage, is where the parties are too nearly related, as being within the forbidden degrees, as, for example, a man marrying his deceased wife's sister. See INCEST. Another instance of the marriage being void, though the ceremony is complete, is where one of the parties is impotent; for it is considered that an essential object of marriage is the procreation of children, and therefore, if this is impossible, the marriage is null. But it is entirely optional with the parties to treat the marriage as null on this head. If they are content, the marriage stands good; if not so, then the party must apply for a declaration of the Divorce Court, that the marriage never was valid, and is null, which decree is only granted on examination and evidence.

*Scotland.*—In Scotland, the law as to the constitution of marriage remains in the same state in which the law of England was before Lord Hardwick's Act, and in which the laws of several foreign countries also remain to this day. Marriage is not only entirely a civil contract, but it is allowed to be entered into with the same freedom as the contract of sale and other contracts which require nothing but mutual consent. The contract may be made by word of mouth, or by writing, and at a moment's notice, nothing in the nature of a preliminary notice, far less any form or ceremony, being requisite. As, however, many contracts are made, not in a direct and specific form, but circuitously and without any precise expression of consent either way, it is often a matter of difficulty afterwards, in case of dispute, to prove the fact, that a contract really was entered into at a given time. Accordingly, it is usual to divide marriages into three kinds, according as the mode of proof is of one description or another; and there is also a division of

## MARRIAGE OF SOLDIERS—MARROW CONTROVERSY.

marriages into regular and irregular. Regular marriages, and these are the most frequent, take place after proclamation of bans in the parish church, some religious ceremony being performed by a clergyman of the Kirk of Scotland, or of some other denomination; or at least the parties must declare themselves married in the presence of such clergyman and witnesses, though the marriage need not take place in a church, nor at any fixed time of day. Irregular or clandestine marriages do not differ from regular marriages in their effects and validity, but merely in this, that the parties, the celebrator and witnesses, are liable to certain small penalties, but which are never enforced in practice. Irregular marriages are generally classified under three heads, according to the nature of proof. 1. There is marriage by mutual consent, expressed in words, in presence of witnesses, or proved by letters or admissions of the parties. Thus, if a man say, pointing to a woman: 'This is my wife;' and she courtesy in assent, this is sufficient proof of their marriage. The consent may also be proved more circuitously by the conduct of the parties. It is essential that the consent should be serious, and not a mere joke. The parties may so arrange it that they may keep the writing which is evidence of the contract secret till the death of either, and then it may be disclosed, and the marriage set up, though a party cannot make a declaration in his will having that effect. The document, whatever it be, may be neutralised by subsequent proof that it was executed with other intentions than those of marriage. 2. Another mode of proving a Scotch marriage is by proving a promise of marriage, *copula subsequente* on the faith and in fulfilment of such promise. The promise itself must be proved, either by some writing or letter of the party, or by reference to his oath. But the *copula* may be proved by parole evidence. The same uncertainty attends this kind of marriage as the former, and the effect of a written promise may be got rid of by proving that it was made for some other purpose than marriage. A promise *cum subsequente copula* is not very marriage, but is merely a good ground for raising an action of declarator; and when decree is obtained, but not before then, marriage is as effectually constituted as by any other mode. 3. The third mode of proving marriage is by proving cohabitation of the parties as man and wife, and habit and repute, i.e., reputation of marriage among friends or neighbours. No promise or consent is here required to be expressly proved, for it is presumed if the parties have for a length of time openly lived together as man and wife. Though concubinage is with difficulty distinguishable from this kind of marriage, still the difference consists in the one being clandestine and unavowed, the other open and undisguised. Concubinage may drift into marriage, though the courts have laid down a rule that this will not be allowed, without evidence of a 'marked change' in the manner and demeanour of the parties. It will be seen from the statement of these different modes of proof, that it must necessarily be sometimes difficult to prove marriage in Scotland, especially as the fact depends not on any one specific form or act of the parties, but on a long course of conduct which admits of endless variations, and the more variety, the more is the difficulty and expense of proof. Hence, it has often been said by strangers, that some persons in Scotland cannot tell whether they are married or not, and it requires an expensive and ruinous litigation to clear up that point, the most noted instance of which in modern times is the case of *Yelverton v. Yelverton*.

*Ireland.*—In Ireland, the law—which in other respects agrees with that of England—as to the

contract of marriage is varied by statute which Protestant marries a Roman Catholic. By the 19 Geo. II. c. 13, every marriage that shall be celebrated between a Roman Catholic and any person who professed him or her self to be a Protestant at any time within twelve months before celebration of marriage, or between two Protestants if celebrated by a Roman Catholic priest, is void. And the 32 Geo. III. c. 21, which made it lawful for the Protestant clergy to grant licenses for marriages to be celebrated between Protestant persons professing Roman Catholicism, did not extend to Protestant dissenting ministers. But by the 33 Geo. III. c. 21, a Roman Catholic priest cannot marry a Protestant and Roman Catholic, or any person who has been or professed to be a Protestant at any time within twelve months before such marriage, unless such Protestant and Roman Catholic have been first married by a clergyman of the Protestant religion; and a Roman Catholic priest is liable to a penalty of £500 for disobeying this law.

**MARRIAGE OF SOLDIERS** has been regulated by the authorities as far as possible, only a limited number of soldiers' wives being permitted to live in barracks with their husbands, and when the marriage has had the special consent of the commanding officer. The necessity of this is obvious; the small pay of a common soldier makes it next to impossible for him to support a family. The women allowed quarters are the wives of staff-sergeants, of about sixty per cent. of the non-commissioned officers, and eight per cent. of the privates. Formerly, the soldier's wife held a position in barracks, which were totally unfit for the residence of a virtuous woman; but recent regulations, her state has been considerably improved, separate rooms being allotted where possible to married couples, and lodging-moneys granted to those for whom separate quarters could not be assigned.

**MARRIED WOMAN.** See *HUSBAND AND WIFE*.

**MARROW** is a substance of low specific gravity, filling the cells and cavities of the bones of mammals. There are two varieties, which are known as *watery marrow* and *oily marrow*. In some of the short bones, as the bodies of the vertebrae and the sternum, the marrow has a reddish color, and is found on analysis to contain 75 per cent. of water, the remainder consisting of albuminous fibrinous matter, with salts and a trace of oil. In the long bones of a healthy adult mammal the marrow occurs as a yellow oily fluid, contained in vesicles like those of common fat, which are imbedded in the interspaces of the medullary membrane, which is a highly vascular membrane covering the interior of the bones. This marrow contains 96 per cent. of oil and 4 of water, connective tissue and vessels.

The oily matter of the marrow is composed of the same materials as common fat, with the oleiferous fluid portion in greater abundance. Being of low specific gravity, it is well suited to fill the cavities of the bones, and forms an advantageous support for the bony matter which preceded it in the young animal. Its special uses are not very known, but the fact that it loses much of its vitality when the general nutritive powers fail, or when certain forms of disease attack the bone, shows that it plays some definite part in the economy.

**MARROW CONTROVERSY**, one of the most strenuous and memorable struggles in the religious history of Scotland, took its name from a tract entitled the *Marrow of Modern Divinity*, written by a Puritan soldier in the time of the Commonwealth.

## MARRUM—MARSALA.

'evangelical' character of this work, and doctrine of the free grace of God in sinners, had made it a great success. The few zealous and pious ministers and in the Church of Scotland, and edition was published by the Rev. James Carnock, followed, in 1719, by an pamphlet. The General Assembly of 1720 appointed a commission to look into the pamphlets promoting such opinions, and in the *Marrow*, and to summon the authors and recommenders of them. The committee, after an examination of a report, which was presented to the Assembly—that of 1720—and the result was a formal condemnation of the doctrines of the *Marrow*, a prohibition to teach or preach the doctrine, a future, and an exhortation (strong, that the people of Scotland not to read the *Marrow*). The act of the Assembly was immediately by the celebrated Thomas Boston, the presbytery of Selkirk, who laid the synod of Merse and Teviotdale. The 'Marrow' ministers in the church, few in number, but supported by a very considerable popular sympathy (for the *Marrow* was placed next to the Bible in the regard of the Scottish peasantry), presented a representation to the next Assembly (1721), complaining of the late act, and stating the 'truths' which it condemned. The representation was signed the representation—James S. Boston, John Bonnar, James Kid, John, Ebenezer Erskine, Ralph Erskine, James Bathgate, Henry Davidson, Peter, and John Williamson. These are the 'Marrow-men'—also known as the 'Marrow-men' and the 'Representers'—whose long held in great veneration by the 'evangelical' religion. A commission of 1721 was appointed to deal with the matter, and a series of questions was put to the Assembly, and answers were drawn up by Ebenezer Erskine and Gabriel Wilson. These replies did not satisfy the Assembly, and the 'Marrow-men' were called before the bar of the Assembly and solemnly rebuked. Nevertheless, as the Assembly was not supported in the position it had taken, the religious sentiment of the nation, no more were taken in the matter, and thus the controversy lay with the evangelical recusants. However, substantially the same controversy did not go by the name—which, eleven years later, resulted in the deposition of Ebenezer Erskine, the originator of the 'Secession' body. THOMAS, and ERSKINE, EBENEZER.

See AMMOPHILA.

T. FREDERICK, an English sailor and the son of a West India merchant, and London on the 10th July 1792. On 1, he entered the navy as a midshipman Cochrane. In 1812, he attained his and was made commander in 1815. he saw much active service, established cter for bravery, and was made a C.B.

About 1830, he wrote his first novel, *Jack Mildmay*, and this was followed in succession by those graphic and humorous sea-life which have taken a permanent place in the English circulating library. He died in Norfolk, on the 2d August 1848. He was married, and left six children.

are too numerous to be enumerated  
most popular are perhaps *Midshipman*  
*Faithful*, and *Japhet in Search of a*

*Father.* His fictions are full of adventure, and are characterised by a certain rude breadth of humour. Since Smollett's time, no novels have provoked so much laughter as his.

MARS, a contraction of MAVERS or MAVORS; in the Oscan or Sabine language, MAMERS, the name of an ancient Italian divinity, identified by the Grecising Romans with the Thracian-Hellenic *Ares*. It will, however, be better to treat the two conceptions separately.

The Roman M., who as a war-god is surnamed *Gradius* (= *grandis dius*, the great god), also bore the surname of *Silvanus*, and appears to have been originally an agricultural deity; and propitiatory offerings were presented to him as the guardian of fields and flocks; but as the fierce shepherds who founded the city of Rome were even more addicted to martial than to pastoral pursuits, one can easily understand how *M. Silvanus* should have, in the course of time, become the 'God of War.' M., who was a perfect personification of the stern, relentless, and even cruel valour of the old Romans, was held in the highest honour. He ranked next to Jupiter; like him he bore the venerable epithet of *Father* (*Mars-piter*); he was one of the three tutelary divinities of the city, to each of whom Numa appointed a flamen; nay, he was said to be the father of Romulus himself (brother of Rhea Silvia, the priestess of Vesta), and was thus believed to be the real progenitor of the Roman people. He had a sanctuary on the Quirinal; and the hill received its name from his surname, *Quirinus*, the most probable meaning of which is *the spear-armed*. It was under this designation that he was invoked as the protector of the *Quirites* (citizens)—in other words, of the state. The principal animals sacred to him were the wolf and the horse. He had many temples at Rome, the most celebrated of which was that outside the *Porta Capena*, on the Appian Road. The *Campus Martius*, where the Romans practised athletic and military exercises, was named after him; so was the month of March (*Martius*), the first month of the Roman year. The *Ludi Martiales* (games held in his honour) were celebrated every year in the circus on the 1st of August.

ARES, the Greek god of war, was the son of Zeus and Hera, and the favourite of Aphrodite, who bore him several children. He is represented in Greek poetry as a most sanguinary divinity, delighting in war for its own sake, and in the destruction of men. Before him into battle goes his sister *Eris* (Strife); along with him are his sons and companions, *Deimos* (Horror) and *Phobos* (Fear). He does not always adhere to the same side, like the great *Athena*, but inspires now the one, now the other. He is not always victorious. Diomedes wounded him, and in his fall, says Homer, 'he roared like nine or ten thousand warriors together.' Such a representation would have been deemed blasphemous by the ancient Roman mind, imbued as it was with a solemn Hebrew-like reverence for its gods. The worship of Ares was never very prevalent in Greece; it is believed to have been imported from Thrace. There, and in Scythia, were its great seats, and there Ares was believed to have his chief home. He had, however, temples or shrines at Athens, Sparta, Olympia, and other places. On statues and reliefs, he is represented as a person of great muscular power, and either naked or clothed with the chlamys.

MARS, one of the planets. See SOLAR SYSTEM.

**MARSA'LA**, a large fortified seaport on the west coast of Sicily, 16 miles S.S.W. of Trapani. Pop. of commune (1871), 34,202. It stands in a fruit-

ful and well-cultivated district, and is a regularly built and pleasant town, with a college, a cathedral, a gymnasium, and several conventual establishments. It occupies the site of Lilybaeum, the ancient capital of the Carthaginian settlements in Sicily, and was selected by Garibaldi as the landing-point of his volunteers in his famous Sicilian campaign, 1860. It obtained its present name from the Arabs, who, when they held Sicily, esteemed this part so highly that they called it *Maren Alla*, 'Port of God.' Its harbour is encumbered with sand, but its celebrated wines form an export trade of great importance, chiefly since 1862, when they were adopted by Lord Nelson for the use of the British fleet. 30,000 pipes of M. wine, which resembles sherry, are annually manufactured, two-thirds being exported. M. has also a large export trade in grain, oil, salt, and soda.

**MARSEILLAISE**, the name by which the grand song of the first French Revolution is known. The circumstances which led to its composition are as follows. In the beginning of 1792, when a column of volunteers was about to leave Strasbourg, the mayor of the city, who gave a banquet on the occasion, asked an officer of artillery, named Rouget de Lisle, to compose a song in their honour. His request was complied with, and the result was the *Marseillaise*—both verse and music being the work of a single night! De Lisle entitled the piece *Chant de Guerre de l'Armée du Rhin*. Next day, it was sung with that rapturous enthusiasm that only Frenchmen can exhibit, and instead of 600 volunteers, 1000 marched out of Strasbourg. Soon from the whole army of the North resounded the thrilling and fiery words *Aux armes, Aux armes*; nevertheless, the song was still unknown at Paris, and was first introduced there by Barbaroux, when he summoned the youth of Marseille to the capital in July 1792. It was received with transports by the Parisians, who—ignorant of its real authorship—named it *Hymne des Marseillais*, which name it has ever since borne.

**MARSEILLE**, the first seaport of France and of the Mediterranean, in the department of Bouches-du-Rhône, is situated on the Gulf of Lyon, 410 miles in a direct line south-south-east of Paris, and in lat. 43° 17' N., long. 5° 22' E. M. is a military place of the fourth class, and is defended by a citadel and other works; the roads are protected by the fortified isles of If (crowned by a castle, once a state-prison), Pomègue, and Ratonneau. Its harbour is formed by an inlet of the sea running eastward into the heart of the city, and from its extent (nearly 70 acres), and its great natural and artificial advantages, it is capable of accommodating 1200 vessels. The new harbour consists of a series of docks or bassins (*de la Joliette, de l'Entrepôt, Napoléon, Impérial*), upwards of a mile long, with an area of about 100 acres. Alongside the Bassins de l'Entrepôt and Napoléon are the bonded warehouses, erected at an outlay of a million sterling, and the finest of the kind in Europe. From the margin of the old harbour, the ground rises on all sides, forming a kind of amphitheatre; and beyond the city proper the encircling hills, covered with vineyards and olive-gardens, are dotted with white country-houses. Immediately north of the harbour is the old town, with its narrow streets, lined with high closely piled houses; but through it a wide avenue, with branches, has recently been driven. South of the old harbour is the church of St Victor, the most ancient of M.; and farther to the south rises the rocky hill of *Notre Dame de la Garde*, with its church, held in the highest veneration by the sailors of the Mediterranean. At the foot of the hill is the wide prome-

nade, *Cours Bonaparte*. Other fine promenades are *Le Cours* and *Le Prado*. The principal public buildings are the Hôtel de Ville, the museum, the public library with its 70,000 vols., and the exchange. The coffee and shops of M. rival those of Paris in splendour. M. is the first commercial port of France. It has many soap-works, iron-manufactories, sugar refineries, &c. The large vessels and steamers annually entering its harbour number upwards of 10,000, and measure above a mile long. M. is directly connected by rail with Lyon, Toulouse, and Nice; and is the packet station to Italy and the East. M. is in point of population the third town of France, having had, in 1872, 218,750 inhabitants. (Total pop. of commune, including military, 312,864.) The formerly barren country round M. has been of late greatly fertilized by means of the canal which supplies M. with water from the Durance. During a portion of the year, the climate of M. is delightful, but in summer and autumn the heat is often intense. Cold, dry, and cutting winds from the north-east render the climate at times exceedingly trying. In the environs of the town are about 6000 *basilides*, or country villas.

M. was founded by a Greek colony from Phoca, in Asia Minor, about 600 years B.C. Its ancient name was *Mosaeia*, written by the Romans *Mosella*. It was an important member of the ancient Greek community, planted numerous colonies along the North Mediterranean shores, and introduced the germs of Greek civilisation into Gaul. The Mosaeians were long in intimate alliance with the Romans; but the city was at last taken by Julius Caesar. In the 8th c., it was destroyed by the Arabs, and the maritime republics of Italy inherited the commerce of the Mediterranean, which formerly had been centred in Marseille. It was united, with the whole of Provence, to France in the reign of Charles VIII. In 1720, when it had again risen to great importance, it was ravaged by a fearful epidemic, and 40,000 of its inhabitants swept away. Since 1830, the commerce and industry of the city have increased vastly. The conquest of Algeria has brought increasing prosperity to M., and its North African trade is now an important part of its commerce.

**MARSH, GEORGE PERKINS, LL.D.**, an American philologist, was born at Woodstock, Vermont, March 17, 1801; graduated at Dartmouth College, New Hampshire, 1820; studied law at Burlington, Vermont; was elected to the Supreme Executive Council of the state in 1835, and to Congress in 1842 and 1849. He was for several years afterwards United States minister resident at Constantinople, and in 1852 was charged with a special mission to Greece. He travelled in the north of Europe, and became an adept in the Scandinavian languages. Between 1857—1859 he served as railroad commissioner for Vermont. In 1861, he was appointed U. S. minister in Italy. His most important works are a *Grammar of the Icelandic Language*; *The Camel, his Organisation and Uses*; *Lectures on the English Language*; *The Origin and History of the English Language*; *Man and Nature*.

**MARSH-MALLOW** (*Althaea*), a genus of plants of the natural order *Malvaceae*, differing from the true mallows chiefly in the 6—9-cleft outer calyx. The species, which are not numerous, are annual and perennial plants, with showy flowers, natives of Europe and Asia. Only one, the COMMON M. (*A. officinalis*), is an undoubted native of Britain, and is common only in the south, growing in meadows and marshes, especially near the sea. It has a stem 2 to 3 feet high, entire or 3-lobed leaves, both leaves and stem densely clothed with soft,

## MARSH-MARIGOLD—MARSHALLING OF ARMS.

down, and large, pale, rose-coloured flowers with 3-4-flowered axillary stalks. Lozenges from it (*Pâtes de Guimauve*) are in use. The whole plant is wholesome, and in seasons of scarcity, the inhabitants of some eastern countries

Marsh-Mallow (*Althaea officinalis*).

have recourse to it as a principal article of food. It is said to be palatable when boiled, and is also fried with onions and butter. The rock (q. v.) is commonly referred to this genus.

**MARSH-MARIGOLD** (*Caltha*), a genus of plants in the natural order *Ranunculaceae*, having about 12-15 sepals, no petals, and the fruit consisting of several spreading, compressed, many-seeded achenes. *C. palustris* is a very common British

Marsh-Marigold (*Caltha palustris*).

with kidney-shaped shining leaves, and yellow flowers, a principal ornament of wet meadows and the sides of streams in spring. It is one of the acridities common in the order; but the buds, preserved in vinegar and salt, are a good substitute for capers.

**MARSHAL** (Fr. *maréchal*, Teut. *mare*, horse, *schalk*, servant), a term, in its origin, signifying a groom or manager of the horse, though originally the king's marshal became one of the principal officers of state in England. The royal marshal rose in dignity with the increasing importance of chivalry, till he became, conjointly with the judge in the *Curia Martiales*,

or courts of chivalry. An earldom is attached to the dignity, and the office of earl-marshal is now hereditary in the family of the Duke of Norfolk. When the king headed his army in feudal times, the assembled troops were inspected by the constable and marshal, who fixed the spot for the encampment of each noble, and examined the number, arms, and condition of his retainers. With these duties was naturally combined the regulation of all matters connected with armorial bearings, standards, and ensigns. The constable's functions were virtually abolished in the time of Henry VIII., and the marshal became thenceforth the sole judge in questions of honour and arms. The earl-marshal is president of the English College of Arms, and appoints the kings-at-arms, heralds, and pursuivants. The marshal's functions were formerly exercised in time of peace in the *Aula Regis* or King's Great Court, and on the division of the *Aula Regis*, he appointed deputies in the new courts; hence arose the offices of Marshal of the King's (Queen's) Bench and of Exchequer, whose principal duty is to take charge of persons committed to their custody by the court. Besides the earl-marshal, there is a knight-marshal, or marshal of the king's (queen's) household. The Marshal of the King's Bench held two different courts, which have been altogether discontinued since 1849. The marshal or provost-marshal of the Admiralty is an officer whose duty it is to act ministerially under the orders of the Court of Admiralty in securing prizes, executing warrants, arresting criminals, and attending their execution.

The dignity of marshal existed formerly in Scotland, where a different orthography was adopted, and the office of marischal was hereditary in the family of Keith. Sir Robert Keith, the marischal, was one of the most distinguished warriors in the army of Robert the Bruce; and his descendant, the marischal, in 1456, had the dignity of earl conferred on him with no other title but that of Earl Marischal. There is little doubt that the lyon king-at-arms was like the English kings-at-arms, originally subject to the marischal, but his dependence ceased at a very early period, and the heraldic functions discharged by the earl-marshal in England devolved in Scotland on the lord lyon, who held office directly from the crown. Scotland had no knight-marischal till 1633, when Charles I., at his coronation, created the office. In 1716, George, tenth Earl Marischal, was attainted in consequence of his share in the rebellion of the previous year, and the office has since been in abeyance. In France, the highest military officer is called a marshal, a dignity which originated early in the 13th century. There was at first only one *Maréchal de France*, and there were but two till the time of Francis I. Their number afterwards became unlimited. Originally, the marshal was the esquire of the king, and commanded the vanguard in war; in later times, the command became supreme, and the rank of the highest military importance. From the title of this class of general officers, the Germans have borrowed their *Feld-marschall*, and we our *Field-marshal*, a dignity bestowed on commanders distinguished either by elevated rank or superior talents.

**MARSHALLING OF ARMS** is the combining of different coats-of-arms in one escutcheon, for the purpose of indicating family alliance or office. In the earlier heraldry, it was not the practice to exhibit more than one coat in a shield, but the arms of husband and wife were sometimes placed *accollée*, or side by side, in separate escutcheons; or the principal shield was surrounded by smaller ones, containing the arms of maternal ancestors; and we not unfrequently find maternal descent or marriage

indicated by the addition of some bearing from the wife's or mother's shield. Then followed *dimidiation*, where the shield was parted per pale, and the two coats placed side by side, half of each being shewn. By the more modern custom of impaling (fig. 1), the whole of each coat is exhibited, a reminiscence of the older practice being retained in the omission of bordures, orles, and tressures on the side bounded by the line of impalement. The most common case of impalement is where the coats of husband and wife are conjoined, the husband's arms occupying the dexter side of the shield, or place of honour, and the wife's, the sinister side. Bishops, deans, heads of colleges, and kings-of-arms, impale their arms of office with their family coat, giving the dexter side to the former.

A man who marries an heiress (in heraldic sense) is entitled to place her arms on a small shield called

Marshalling of Arms.

an *escutcheon of pretence*, in the centre of his achievement, instead of impaling, as in fig. 2.

*Quartering* (fig. 3), or the exhibiting different coats on a shield divided at once perpendicularly and horizontally, is the most common mode of marshalling arms, a practice which, however, was unknown till the middle of the 14th century. The divisions of the shield are called quarters, and are numbered horizontally, beginning at the dexter chief. The most common object of quartering is to indicate descent. The coats quartered in an escutcheon must all have been brought in by successive heiresses, who have intermarried into the family. In the case of a single quartering, the paternal arms are placed in the first and fourth quarters, and the maternal in the second and third. The third and fourth quarters may, in after-generations, be occupied by the arms of a second and third heiress. Sometimes an already quartered coat is placed in one of the four quarters of the escutcheon, then termed a *grand quarter*. We occasionally find the shield divided by perpendicular and horizontal lines into six, nine, or even more parts, each occupied by a coat brought in by an heiress; and in case of an odd number of coats, the last division is filled by a repetition of the first. In the course of generations, a shield may thus be inconveniently crowded by the accumulation of coats, including the several coats to which each heiress may, in a similar way, have become entitled, and in Germany, sometimes twenty or thirty coats are found marshalled in one escutcheon; but in British heraldry, families entitled to a number of quarterings, generally select some of the most important. Quarterings, at least in Scotland, are not allowed to be added to the paternal coat without the sanction of the heraldic authorities.

Sovereigns quarter the ensigns of their several states, giving precedence to the most ancient, unless it be inferior to the others in importance. In the royal escutcheon of the United Kingdom, England is placed in the first and fourth quarters, Scotland in the second, and Ireland in the third; the relative positions of Scotland and England being, however, reversed on the official seals of Scotland. Spain bears the arms of Leon in the first and fourth quarters, and Castile in the second and third. An elected king generally places his arms surmount on an escutcheon of pretence.

MARSH'S TEST. See ABSENIC.

MARSICO NUOVO, a town in the province of Potenza, 18 miles south of the Potenza, built on a height, and exposed to winds. Pop. 6355.

MARSILEA'CEÆ, or RHIZOCAR, natural order of Acotyledonous plants, near to *Lycopodiaceæ*, but differing in the want of and in the usually stalked leaves. The species all inhabitants of ditches and pools, ch temperate regions, and two of them occur in parts of Great Britain. No species was known of any importance till the discovery of Nardoo (q. v.) of Australia.

MARSUPIA'LIA, or MARSUPIA, extensive order or group of mammals, essentially from all others in their organs and especially in their generative system animals of this aberrant group originally the name of *Animalia Crumenata*, or Purse Animals; and the names now employed similar signification, being derived from *pium*, a pouch or bag. This marsupium, or which is situated on the abdomen of the contains the teats, and serves for the protection of the immature young; and is unquestionably the most marked characteristic of these animals. The different genera of this order live upon kinds of food—some being herbivorous, others tavorous, and others, again, purely carnivorous. We find various modifications of their organs of progression, prehension, and digestion; but the most important of these modifications are in the articles on the principal genera, we confine ourselves to the characters common to the group.

The leading peculiarity presented by the group is the presence of the marsupial bones (see MALLIA), which are attached to the pubis, and imbedded in the abdominal muscles. Another but less striking peculiarity is a greater inversion of the angle of the lower jaw. The organs of digestion, including the teeth, vary according to the nature of the food; a small stomach and a cæcum of considerable size present in some, while others (the carnivorous genera) have a simple stomach and no cæcum. The brain is constructed on a simpler type than in placental mammals. The size of the hemispheres (fig. 1, A) is so small that they leave exposed the olfactory ganglion (a), the cerebellum (C), and more or less of the optic lobes (B), and they are but partially connected together by the 'fornix' and 'anterior commissure,' the great cerebral commissure known as the 'corpus callosum' being absent. In accordance with this condition of the brain, these animals are all characterised by a low degree of intelligence, and are said (when in captivity) not to manifest any sign of recognition of their feeders. It is, however, in the organs of

generation and mode of reproduction that animals especially differ from all the other mammals. Professor Owen, who has done much to elucidate this subject, and indeed the anatomy and physiology of marsupials generally, than any other anatomist, observes that in all the genera of

Fig. 1.  
Brain of Opossum.

der the uterus is double, and the introductory passage more or less (sometimes wholly) separated into two lateral canals. Both the digestive and excretory tubes terminate within a common Cloaca (q. v.), and there are various other points in which these animals manifest their affinity to the oviparous vertebrates. The marsupial bones serve important purposes in connection with their generative economy. 'In the female,' he observes, 'they assist in producing a compression of the Mammary gland necessary for the alimen-

Fig. 2.

Line of the Kangaroo about twelve hours after birth, showing its natural size and external development at this period.

mentation of a peculiarly feeble offspring, and they defend the abdominal viscera from the pressure of the young as these increase in size during their marsupial existence, and still more when they return to the pouch for temporary shelter,' while in the males they are subservient to the reproductive process. The marsupials belong to the *aplacental* division of the *ammalia* (q. v.). The period of their gestation is short (26 days in the Virginian opossum, and 39 days in the kangaroo), and the young are produced in so immature a state, that the earlier observers believed that they were produced like buds from the nipples to which they saw them attached. The appearance presented by a young kangaroo of the largest species, within twelve hours of being deposited in the pouch, is described by Professor Owen (from personal observation in the Zoological Gardens) as follows: 'It resembled an earthworm in the colour and semi-transparency of its integument, adhered firmly to the point of the nipple, breathed strongly but slowly, and moved its fore-legs when disturbed. The body was bent on the abdomen, its short tail tucked in between its hind-legs, which were one-third shorter than the fore-legs. The whole length from the nose to the end of the tail, when stretched out, did not exceed an inch and two lines.' The mother apparently employs her mouth in placing the young at the nipple, where it remains suspended, involuntarily absorbing milk for a considerable time (probably about two months on an average), after which, it sucks spontaneously for some months. Although able from the first, by the muscular power of its lips, to adhere only to the nipple, it does not possess the strength to obtain the milk by the ordinary process of sucking. In the process, it is assisted by the adaptation of a muscle to the mammary gland, which, by contracting, injects the milk from the nipple into the mouth of the adherent foetus; and to prevent the entrance of milk into the air-passage, the larynx is prolonged upwards to the aperture of the posterior nares, where it is closely embraced by the muscles of the soft palate. The air-passage is thus entirely separated from the throat, and the milk passes on either side of the larynx into the oesophagus.

Professor Owen has proposed that these animals should be divided into five tribes or primary groups, viz., *Sarcophaga*, *Entomophaga*, *Carpophaga*, *Pachyphaga*, and *Rhizophaga*, according to the nature of their food. With the exception of one American and one Malayan genus, all known existing marsupials belong to Australia, Tasmania, and New Guinea.—For further details regarding this order, the reader is referred to Waterhouse's *Natural History of the Ammalia*, vol. i., and to Owen's article 'Marsupialia' in the *Cyclopædia of Anatomy and Physiology*.

**MARTABAN**, the name of a small town, in a province of that name, in British Burmah, on the banks of the river of the same name, and near its mouth in the Gulf of M., in lat. 16° 32' N., long. 97° 35' E., was the first that fell into the hands of the British in the Burmese war in 1852.

**MARTEL**, CHARLES. See CHARLES MARTEL.

**MARTELLO TOWERS** are round towers for coast defence, about 40 feet high, built most solidly, and situated on the beach. They occur in several places round the coast of the United Kingdom; but principally opposite to the French coast, along the southern shore of Kent and Sussex, where, for many miles, they are within easy range of each other. They were mostly erected during the French war, as a defence against invasion. Each had walls of 5½ feet thickness, and was supposed to be bomb-proof. The base formed the magazine; above were two rooms for the garrison, and over the upper of these the flat roof, with a 4½-foot brick parapet all round. On this roof a swivel heavy gun was to be placed to command shipping, while howitzers on each side were to form a flanking defence in connection with the neighbouring towers. Although the cost of these little forts was very great, they are generally considered to have been a failure; their armaments have mostly been removed, and their garrisons of six to twelve pensioner-soldiers replaced by coast-guard men, or in some cases by old master-gunners.

The name is said to be taken from Italian towers built near the sea, during the period when piracy was common in the Mediterranean, for the purpose of keeping watch and giving warning if a pirate-ship was seen approaching. This warning was given by striking on a bell with a hammer (Ital. *martello*), and hence these towers were called *Torri da Martello*.

**MARTEN** (*Martes*), a genus of digitigrade carnivorous quadrupeds of the family *Mustelidae*, differing from weasels in having an additional false molar on each side above and below, a small tubercle on the inner side of the lower carnivorous cheek-teeth, and the tongue not rough—characters which are regarded as indicating a somewhat less extreme carnivorous propensity. The body is elongated and supple, as in weasels, the legs short, and the toes separate, with sharp long claws. The ears are larger than in weasels, and the tail is bushy. The martens exhibit great agility and gracefulness in their movements, and are very expert in climbing trees, among which they generally live. Two species are natives of Britain, the COMMON M., BEECH M., or STONE M. (*M. foina*), and the PINE M. (*M. abietum*), inhabiting chiefly the more rocky and wooded parts of the island; the former in the south, and the latter in the north. Both were once much more common than they now are, being sought after on account of their fur, and killed on every opportunity, because of their excessive depredations among game and in poultry-yards. The head and body are about 18 inches long, the tail nearly 10 inches. Both species are of a dark tawny colour, the Common M. having a white throat, and the Pine M. a yellow throat. Many naturalists regard them as varieties of one species, of which also they reckon the Sable (q. v.) to be another variety. The fur of the martens is of two sorts: an inner fur, short, soft, and copious, and long outer hair, from which the whole fur derives its colour. The Common M. is much less valuable for its fur than the Pine M., whilst the Pine M. is much less valuable than the sable; but skins of the Common M. are imported in great numbers from the north of Europe, and they are often dyed, and sold as an inferior kind of sable.

mother of our Lord according to the flesh, is held in high honour by all Christians; and her intercession is invoked with a higher religious worship and a firmer confidence than that of all the other saints, not only in the Roman Church, but in all the Christian churches of the East—the Greek, the Syrian, the Coptic, the Abyssinian, and the Armenian. Of her personal history, but few particulars are recorded in Scripture. Some details are filled up from the works of the early Fathers, especially their commentaries or deductions from the scriptural narrative; some from the apocryphal writings of the first centuries, and some from medieval or modern legends. The twofold genealogy of our Lord (Matt. i. 1—16, and Luke iii. 23—38) contains the only statement regarding the family of M. which the sacred writers have left. The genealogy of our Lord in St Matthew is traced through Joseph; and as it is plainly assumed that M. was of the same family with her husband Joseph, the evidence of the descent of the latter from David is equivalently an evidence of the origin of M. from the same royal house. But the genealogy of Christ as traced in St Luke is commonly held to be the proper genealogy of his mother in the flesh, Mary. Hence it is inferred that the Heli of this genealogy (Luke iii. 23) was the father of M.; and it may be added, in confirmation of this inference, that M. is called in the Talmud the 'daughter of Heli,' and that Epiphanius (Hort. lxxviii. n. 17) says her parents were Anna and 'Joachim,' a name interchanged in Scripture (as 2 Chron. xxxvi. 4) with Eliachim, of which name Eli or Heli is an abridgment. The incidents in her personal history recorded in Scripture are few in number, and almost entirely refer to her relations with our Lord. They will be found in Matt. i. ii. xii.; Luke i. ii.; John ii. xix.; and Acts i., where the last notice of her is of her 'persevering in prayer' with the disciples and the holy women at Jerusalem after our Lord's ascension (Acts i. 14). Beyond the few leading facts which will be found under these references, the Scripture is silent as to the life of M. during the presence of our Lord on earth; nor of her later life is there any record in the canonical Scriptures. The apocryphal gospels, entitled 'The Gospel of the Nativity of Mary,' and the 'Protevangelion of the Birth of Christ,' contain some additional, but, of course, unauthentic particulars as to the lineage, birth, and early years of M.; among which is the miraculous story of her betrothal with Joseph, immortalised by the pencil of Raphael, according to which narrative Joseph was selected from among all who had been proposed as suitors for the hand of M. by the supernatural sign of a dove issuing from his rod and alighting upon his head. See Protevangelion, cap. viii. As to her history after the ascension of her son, the traditions differ widely. A letter ascribed to the Council of Ephesus speaks of her as having lived with John at that city, where she died, and was buried. Another epistle, nearly contemporaneous, tells that she died and was buried at Jerusalem, at the foot of the Mount of Olives. Connected with this tradition is the incident which has so often formed a subject of sacred art, of the apostles coming to her tomb on the third day after her interment, and finding the tomb empty, but exhaling an 'exceeding sweet fragrance.' On this tradition is founded the belief of her having been assumed into heaven, which is celebrated in the festival of the Assumption. The date of her death is commonly fixed at the year of our Lord 63, or, according to another account, the year 48. Another tradition makes her survive the crucifixion only 11 years.

Many theological questions regarding the Virgin M. have been raised among Christians of the various

churches, which would be quite out of place here. One of these, which possesses present interest, has been treated under a separate head. See LATE CONCEPTION. The perpetual virginity of M. is not explicitly attested in Scripture, and there are even certain phrases which at first sight seem to imply that children were born of her after the birth of Jesus, as that of his being called (Matt. i. 25, Luke ii. 7) her 'firstborn son,' and that of James and others being more than once called 'brothers of the Lord.' On the latter argument, no critic acquainted with the wide scriptural use of the word 'brother' would ever rely. The former, which was urged anciently by Helvidius and others, but was rejected by the unanimous voice of tradition, is founded on a passage susceptible of equal latitude of interpretation. The perpetual virginity of M. is held as a firm article of belief in the Roman and Eastern churches. Protestants hold nothing positively on the subject. The controversies regarding the Virgin M. have reference to the lawfulness of the worship which is rendered to her in some Christian communities. See MARIOLATRY.

MARY I., queen of England, daughter of Henry VIII. by his first wife, Catharine of Aragon, was born at Greenwich on the 18th of February 1533. She was in her early years a great favourite with her father, who had her carefully educated after the masculine fashion of her time. Erasmus praises particularly the style of her Latin letters. At the age of seven, she was betrothed to the Emperor Charles V.; but when Henry sought a divorce from Queen Catharine, the Spanish monarch broke off the engagement. Her father then tried to marry her to Francis I. of France, but his design did not succeed. Francis, however, asked her for his second son, the Duke of Orleans, but Henry in turn refused. After the birth of Elizabeth, Henry's affections were diverted to that princess; and when James V. of Scotland sought the hand of M., it was refused, on the ground that the issue of such union might imperil the right of Anne Boleyn's children to the crown. This was virtually condemning M. to celibacy, and doubtless had the effect of making her still more attached to the Catholic party, to which, on account of her training, her natural tendencies, and the wrongs of her mother, she was already closely allied. Several other matrimonial negotiations, with the Prince of Portugal, the Duke of Cleves, and the Duke of Bavaria, also came to nothing. About this time, she was in great danger of losing her life, on account of her strong attachment to her mother's interests. Towards the close of Henry's reign, better prospects opened out for her; in 1544, she was restored to her place in the line of succession, of which she had been deprived, and she lived on very good terms with Catharine Parr, the last of her father's numerous wives. During the reign of her half-brother, Edward VI., she lived in retirement, but had three more offers of marriage—from the Duke of Brunswick, the Markgraf of Brandenburg, and the Infante of Portugal—none of which was accepted. On the death of Edward in 1553, she was proclaimed queen; and after a brief and imbecile struggle on the part of those who advocated the claims of Lady Jane Grey, was crowned in October of the same year by Stephen Gardiner, Bishop of Winchester. A fierce spirit in favour of the papacy soon began to shew itself, although it does not appear that M. herself was at first disposed to be severe; she even occasionally interfered to mitigate the cruelties of Gardiner and Bonner; but after her marriage with Philip of Spain (July 25, 1554), to whose father she had been betrothed many years before, a worse spirit took possession of her, or at least worse counsels

## MARTIGNY—MARTINEAU.

**MARTIGNY**, or **MARTINACH** (the *Octodurus* of the Romans), a small town of Switzerland, in the canton of Valais, is situated on the Drance, an affluent of the Rhone, about 24 miles south-south-east from the east end of the Lake of Geneva. The two noted routes, one to the vale of Chamouni by the Tête Noire or the Col de Balme, and another to the Great St Bernard, branch off here. M. is on the Simplon road into Italy. It is a great resort for tourists, and has a population of about 1200.

**MARTIGUES**, a small town of France, in the Department of Bouches du Rhone, is situated on three islands, united by bridges, in the entrance to the Etang de Berre, 16 miles north-west of Marseille. From the peculiarity of its position, it has been called the Provençal Venice. Pop. (1872) 5792, engaged in the tunny and pilchard fisheries.

**MARTIN**. See SWALLOW.

**MARTIN**, Bishop of Tours, and a saint of the Roman Catholic Church, was born in Pannonia about the year 316. He was educated at Pavia, and at the desire of his father, who was a military tribune, entered the army, first under Constantine, and afterwards under Julian the Apostate. The virtues of his life as a soldier are the theme of more than one interesting legend. On obtaining his discharge from military service, M. became a disciple of Hilary, Bishop of Poitiers (q. v.). He returned to his native Pannonia, and converted his mother to Christianity, but he himself endured much persecution from the Arian party, who were at that time dominant; and in consequence of the firmness of his profession of orthodoxy, he is the first who, without suffering death for the truth, has been honoured in the Latin Church as a confessor of the faith. On his return to Gaul, about 360, he founded a convent of monks near Poitiers, where he himself led a life of great austerity and seclusion; but in 371 he was drawn by force from his retreat, and ordained Bishop of Tours. The fame of his sanctity, and his repute as a worker of miracles, attracted crowds of visitors from all parts of Gaul; and in order to avoid the distraction of their importunity, he established a monastery near Tours, in which he himself resided. His life by his contemporary, Sulpicius Severus, is a very curious specimen of the Christian literature of the age, and in the profusion of miraculous legends with which it abounds, might take its place among the lives of the mediæval or modern Roman Church. The only extant literary relic of M. is a short *Confession of Faith on the Holy Trinity*, which is published by Galland, vol. vii. 559. In the Roman Catholic Church, the festival of his birth is celebrated on the 11th November. In Scotland, this day still marks the winter-term, which is called *Martinmas* (the mass of St Martin). Formerly, people used to begin St Martin's Day with feasting and drinking; hence the French expressions *martiner* and *faire la St Martin*, 'to feast.'

**MARTIN**, the name of five popes, of whom the fourth and fifth deserve a brief notice.—**MARTIN IV.** (Nicholas de la Brie), a Frenchman, was elected in 1281. His name is best known in connection with the memorable tragedy of the 'Sicilian Vespers.' Having been from the time of his election a devoted adherent of Charles of Anjou, he supported that monarch with all his influence, and even by the spiritual censures which he had at his command, in his effort to maintain French domination in Sicily; and it is to his use of the censures of the church in that cause that many Catholic historians ascribe the decline and ultimate extinction of the authority in temporals which the papacy had exercised under the distinguished pontiffs who

preceded him. He died at Perugia in 1285.—**MARTIN V.** must be noticed as the pontiff in whose election was finally extinguished the great WESTERN SCHISM (q. v.). He was originally named Otho Colonna, of the great Roman family of that name. On the deposition of John XXIII., and the two rival popes Gregory XII. and Benedict XIII., in the council of Constance, Cardinal Colonna was elected. He presided in all the subsequent sessions of the council, and the Fathers having separated without discussing the questions of reform, at that period earnestly called for in the church, Martin undertook to call a new council for the purpose. The council was summoned accordingly, after several years, to meet at Siena, and ultimately assembled at Basel in 1431. Martin died in the same year.

**MARTIN**, JOHN, an English painter, was born in the neighbourhood of Hexham, Northumberland, 19th July 1789, went to London in 1806, and—after some years spent in obscure struggles—made his first appearance as an exhibitor at the Royal Academy in 1812. His picture was entitled 'Sadak in Search of the Waters of Oblivion,' and attracted much notice. It was followed within two years by the 'Expulsion from Paradise,' 'Clytée,' and 'Joshua commanding the Sun to stand Still.' The last of these works was a great success in point of popularity, but it was also the cause of a quarrel between M. and the Academy, in consequence of which he never obtained any distinction from the society. From this period till nearly the close of his life, he incessantly painted pictures in a style which was considered 'sublime,' by the same sort of people who thought Montgomery's *Satan* and Pollok's *Course of Time* equal to *Paradise Lost*. The principal of these 'sublime' productions are 'Belshazzar's Feast' (1821); 'Creation' (1824); 'The Deluge' (1826); 'The Fall of Nineveh' (1828); 'Pandemonium' (1841); 'Morning' and 'Evening' (1844); 'The Last Man' (1850). M. died at Douglas, Isle of Man, February 9, 1854.

**MARTIN**, St, one of the Lesser Antilles, lies in 18° 4' N. lat., and 63° 8' W. long. Area about 30 square miles. The northern part of St M. belongs to France, and the southern to the Netherlands. It is mountainous in the interior, indented with bays, and is about four square leagues in extent. There are salt marshes from which much salt is made; and sugar-canes, cotton, tobacco, maize, plantains, bananas, and other West India products are cultivated. In 1860, the Great Salt Pan produced 301,234 vats of salt, valued at £15,060 sterling. Population of the French part of the island about 3450; of the Netherlands part, 2820. The law for emancipating the slaves in the Netherland West Indies, which passed the States-general August 1862, came into operation July 1863.

**MARTINA**, a fine town of the Italian province of Lecce, situated on a hill 18 miles north-north-east of Taranto. Pop. 16,700. It is a rising industrious place, and has a fine palace of similar architecture to the great Roman palace Panfilii.

**MARTINEAU**, HARRIET, an English authoress, was born at Norwich 12th June 1802. Her education was conducted for the most part at home; from an early age she was a lover of books, and was wont to amuse her solitary hours by committing her thoughts to paper. Her father's affairs becoming embarrassed, she was compelled to procure her own livelihood; in the first instance, it is said, as a teacher of music, which profession she was compelled to relinquish from deafness, when she began to turn her attention to literature. If this be so,

it affords a remarkable example of the good gifts which necessity, the hard mother, has sometimes in store for her children. Had this lady remained in affluence, or unvisited by physical affliction, it is probable that England would have been without, if not its greatest, certainly its most remarkable female writer. The subjects upon which her pen has been exercised are of the most varied kind, including some—such as politics—which have rarely been before attempted by women. Her first volume, entitled *Devotions for Young People*, appeared in 1823; and was followed in 1824 by *Christmas Day*, a tale, and by *The Friend*, a sequel, the year after. In 1826, she published *Principle and Practice*, and *The Rioters*; and for two years thereafter she was busily engaged writing stories and a series of tracts on social matters, adapted mainly for the perusal of the working-classes. In 1830, she produced her *Traditions of Palestine*. During the same year, the Association of Unitarian Dissenters awarded her prizes for essays on the following subjects: *The Faith as unfolded by many Prophets*, *Providence as Manifested through Israel*, and *The Essential Faith of the Universal Church*. Her next important literary venture was unique, and in one of the softer sex almost audacious, *The Illustrations of Political Economy*, a series of tales, which met with great and deserved success, and was followed by others illustrative of *Taxation*, and *Poor-law and Paupers*. In 1835, she crossed the Atlantic, and published her *Society in America* in 1837. In 1839, she published *Deerbrook*, which was followed by *The Hour and the Man*. She afterwards produced a series of tales for the young, the best known of which are *Feats on the Fjord*, and *The Crofton Boys*. About 1839, and on till 1844, she was an invalid more or less, and during this period she wrote *Life in the Sick-room*. On her recovery she published *Forest and Game-law Tales*. In 1846, she visited Palestine, and collected materials for *Eastern Life, Past and Present*, which she published on her return. Afterwards, she completed Mr Knight's *History of England during the Thirty Years' Peace*—her best and most useful work, perhaps, on the whole. In 1851, in conjunction with Mr H. G. Atkinson, she published a series of *Letters on the Laws of Man's Social Nature and Development*, convulsing the literary coteries with the boldness of her speculations. The long catalogue of her literary labours includes her translation of Comte's *Positive Philosophy*; *Household Education*; a *Complete Guide to the Lakes*; *British India*; and *Health, Husbandry, and Handicraft*. M. has besides been a constant contributor to the larger reviews, and the daily and weekly press.

MARTINEAU, JAMES, brother of the preceding, was born in Norwich about 1807. He was educated for the ministry in connection with the Unitarian body of Christians, and was pastor of congregations in Dublin and Liverpool. He was for many years Professor of Mental and Moral Philosophy in Manchester New College; and that institution having been removed to London, he resigned his pastoral charge in Liverpool in 1858, and transferred his residence to the metropolis, where he became joint-pastor of the Unitarian Church of Little Portland Street. He is understood to have been one of the projectors of the *National Review*, and has been a frequent contributor to its pages. This periodical may be taken as generally representing his theological views. M. is one of the most earnest and lofty of living religious writers. He is deeply read in German theology and philosophy, and is remarkable for strong grasp of thought and power of subtle analysis. He

is a master of English style, and in the power of giving form and substance to the most abstract thought, has seldom been surpassed. His principal works are the *Rationale of Religious Inquiry* (1836), *Endeavours after the Christian Life* (1840), *Miscellanies* (1852), *Studies of Christianity* (1858), and *Essays, Philosophical and Theological* (1858).

MARTINI'QUE, or MARTINICO, called by the natives MADIANA, one of the Lesser Antilles, is 40 miles long, about 12 miles broad, and has an area of about 380 square miles, and 137,455 inhabitants, of whom upwards of 87,000 are black. The island was discovered by the Spaniards in 1493, colonised by the French in 1635, and now belongs to that nation. It is of an oval form, with much indented coasts, and is everywhere mountainous; the highest peak, Mount Pelée, being considerably more than 4000 feet above sea-level. There are six extinct volcanoes on the island, one of them with an enormous crater. The cultivated portion of M. (about one-third of the whole) lies chiefly along the coast. The climate is moist, but, except during the rainy season, is not unhealthy, and the soil is very productive. Of the land in cultivation, about three-fifths are occupied with sugar-cane. Slavery was abolished in 1848. The island is liable to dreadful hurricanes. A floating dock was opened in 1867, at Fort-la-France, the capital (formerly Fort Royal); a telegraph line thence to St Pierre (q. v.) was at work in 1866; and since then a railway has been set on foot. The exports exceed a million sterling in annual value.

MARTINMAS, in Scotland, is one of the four quarter-days for paying rent—viz., 11th November.

MARTIUS, CARL FRIEDRICH PHILIPP VOX, one of the most distinguished of modern travellers and naturalists, born at Erlangen 1794. He studied medicine at Erlangen, and had published two botanical works, when he was induced to proceed to Brazil as a member of a scientific expedition sent out by the Austrian and Bavarian governments, and by his researches in that country acquired a reputation inferior perhaps to that of no scientific traveller except Humboldt. He was specially intrusted with the botanical department, but his researches extended to ethnography, statistics, geography, and natural science in general; and his works published after his return exhibit a poet's love of nature and great powers of description. These works are: *Reise nach Brasilien* (3 vols. Munich, 1824—1831); *Novi Genera et Species Plantarum* (3 vols. Munich, 1824—1832); and *Icones Plantarum Cryptogamarum* (Munich, 1823—1834). He also published a most valuable monograph of palms, *Genera et Species Palmarum* (3 vols. Munich, 1823—1845). He is the author of a number of other botanical works, some of which are monographs of orders and genera; also of works relative to tropical America, as *Die Pflanzen und Thiere des tropischen Amerikas* (Munich, 1831); *Das Naturell, die Krankheiten, das Arzthum und die Heilmittel der Urbevölker Brasiliens* (Munich, 1843); *Systema Materia Medici Vegetabilis Brasiliensis* (Leip. 1843). He has contributed largely to the *Flora Brasiliensis* (Stuttgart, 1829, &c.); and has written on the Potato Disease (Munich, 1842), &c., &c. He is Professor of Botany and Director of the Botanic Garden at Munich.

MARTLET, in Heraldry, a bird resembling a swallow, with long wings, very short beak and thighs, and no visible legs, given as a mark of cadency to the

## MARTOS—MARY.

earth son. It is also otherwise used as a charge. The martlet was originally meant for the martin, and in the earliest heraldry, it is not deprived of a feet.

**MARTOS**, a town of Andalusia, Spain, 16 miles north-west of the city of Jaen, on a steep hill crowned by an old castle. It is resorted to for its mineral waters. Pop. stated at 11,000.

**MARTYR** (Gr. *martyr*, a witness), the name given in ecclesiastical history to those who, by their fearless profession of Christian truth, and especially their fortitude in submitting to death itself rather than abandon their faith, bore the 'witness' of their blood to its superhuman origin. Of the same use of the word, there are some examples also in the New Testament, as in Acts xxii. 20, Apoc. ii. 13, and xvii. 6. But this meaning, as its technical and established signification, is derived mainly from ecclesiastical writers. During the Persecutions (q.v.) the Christians in the first three centuries, contemporary writers, as well as pagan as Christian, record that many Christians preferring death to apostasy, came martyrs or witnesses in blood to the faith, even in circumstances of the utmost heroism. The courage and constancy of the sufferers won the highest admiration from the brethren. It was held a special privilege to receive the martyr's benediction, to kiss his chains, to visit him in prison, or to converse with him; and, as it was held that their great and superabundant merit might, in the eyes of the church, compensate for the laxity and weakness of less perfect brethren, a practice arose by which the martyrs gave to those sinners who were undergoing a course of public penance, letters of commendation to their bishop, in order that their course of penance might be shortened or suspended altogether. See **INDULGENCE**. The day of martyrdom, moreover, as being held to be the day of the martyr's entering into eternal life, was called the 'natal' or 'birth' day, and as such was celebrated with peculiar honour, and with special religious services. Their bodies, clothes, books, and other objects which they had possessed were treasured as **RELICS** (q.v.), and their tombs were visited for the purpose of asking their intercession. See **INVOCATION**. The number of martyrs who suffered death during the first ages of Christianity has been a subject of great controversy. The ecclesiastical writers, with the natural pride of partisanship, have, it can hardly be doubted, leaned to the side of exaggeration. Some of their statements are palpably excessive; and Gibbon, in his well-known 16th chapter, throws great doubt even on the most moderate of the computations of the church historians. But it is clearly though briefly shewn by Guizot in his notes on this celebrated chapter (see Milman's *Gibbon's Decline and Fall*, i. 598), that Gibbon's criticisms are founded on unfair and partial data, and that even the very authorities on which he relies demonstrate the fallaciousness of his conclusions. Those who are interested in the subject will find it discussed with much learning and considerable moderation in Ruinart's *Acta Primitiva et Sincera Martyrum*. Considerable difference of opinion also has existed as to what, in the exploration of the ancient Christian tombs in the Roman catacombs, are to be considered as signs of martyrdom. The chief signs, in the opinion of older critics, were (1), the letters B. M.; (2), the figure of a palm-tree; and (3), a phial with the remains of a red liquor believed to be blood. Each of these has in turn been the subject of dispute, but the last is commonly regarded as the conclusive sign of martyrdom. The first recorded martyr of Christi-

anity, called the 'proto-martyr,' was the deacon Stephen, whose death is recorded Acts vi. and vii. The proto-martyr of Britain was Alban of Verulam, who suffered under Diocletian in 286 or 303.

**MARTYROLOGY**, a calendar of martyrs and other saints arranged in the order of months and days, and intended partly to be read in the public services of the church, partly for the guidance of the devotion of the faithful towards the saints and martyrs. The use of the martyrology is common both to the Latin and to the Greek Church, in the latter of which it is called *Menologion* (from *Men*, a month), or 'month-calendar.' The earliest extant Greek martyrology or menology dates from the 9th century. It was published in 1727 by Cardinal Urbini. The oldest Latin martyrology is that attributed to St Jerome, published in the 11th volume of the collected edition of his works by Vallars; but the genuineness at least of some portions of it is more than doubtful. In the medieval period, martyrologies were issued in England by Venerable Bede; in France by Florus, Ado, and Usuard; and in Germany by St Gall, Nolter, and Rabanus Maurus. The so-called 'Roman Martyrology' is designed for the entire church, and was published by authority of Gregory XIII., with a critical commentary by the celebrated Cardinal Baronius in 1586. A still more critical edition was issued by the learned Jesuit, Herebert Rosweid.

**MARUT** is, in Hindu Mythology, the god of wind; his wife is Anjana, and his son Hanuman (q.v.). Bhîma, the second of the Pân'du princes (see **MAHABHARATA**), is likewise considered as an offspring of this god.

**MARVEL OF PERU**. See **JALAP**.

**MARVELL, ANDREW**, an English writer and politician, was born 15th November 1620 at Hull, in Yorkshire, where his father was master of the grammar-school and lecturer of Trinity Church. He studied at Trinity College, Cambridge, and afterwards spent several years in various parts of the continent, 'to very good purpose,' according to Milton. He returned to England about 1653, and was employed by Oliver Cromwell as tutor to a Mr Dutton; in 1657, he became assistant-secretary to Milton; and in 1660, was chosen by his native town to represent it in parliament. M.'s parliamentary career was both singular and honourable. Without fortune or influence, possessing no commanding talent as a speaker, nor, indeed, brilliant intellectual qualities of any kind, he maintained a character for integrity, so genuine and high that his constituency felt itself honoured by his conduct, and allowed him to the end of his life 'a handsome pension.' Otherwise, it would have occasionally fared ill with this incorruptible patriot, for he was often reduced to great pecuniary straits. Charles II. made many but fruitless efforts to win him over to the court-party. The story of the interview between M. and the Lord Treasurer Danby, who had found out the patriot's lodgings (with difficulty) 'up two pair of stairs, in one of the little courts in the Strand,' is believed to be essentially true, and indicates a certain noble republican simplicity of nature, which cannot be too highly admired. M. died 16th August 1678, not without suspicion of poison. His writings, partly in verse, and partly in prose, are satirical, sharp, honest, and pithy (like his talk), but they relate to matters of temporary interest, and are now well-nigh forgotten. An edition of them was published, along with a life of the author, by Captain Edward Thompson, London, 1776.

**MARY, THE BLESSED VIRGIN** (Heb. *Miriam*, Gr. *Maria* or *Mariam*), called in the New Testament 'the mother of Jesus' (Matt. ii. 11, Acts i. 14), as the

# MARYLAND—MASK.

Clouet, more commonly called Jehannet or Janet, and the statue, by an unknown sculptor, on her tomb at Westminster. All portraits which cannot be reconciled with these types may safely be rejected as spurious.

**MARYLAND**, one of the original 13 American states, lies immediately south of Pennsylvania, and is bounded on the east by Delaware and the Atlantic Ocean, between lat. 37° 48'—39° 44' N., and long. 75° 4'—79° 33' W. Area, 11,124 square miles, or 7,119,360 acres; pop. (1870) 780,094; income for the year 1869, 3,002,090 dollars. The line of Atlantic coast is but 33 miles, but including Chesapeake Bay, is 411 miles. This bay, 15 miles wide at its mouth, expands to a breadth of 30 miles, with numerous islands, and reaches nearly across the state. The country rises gradually from the coast to the tops of the Alleghanies, with great varieties of formation, including deposits of coal, iron, copper, chromate of iron, silicates and hydrates of magnesia, marl, &c. The climate is temperate, and the soil fertile, producing wheat, Indian corn, cotton, tobacco, apples, plums, peaches, grapes. Its chief towns are Baltimore, Annapolis, Fredericktown, Cumberland. Vast quantities of fruit and of oysters are exported from Maryland. The annual produce of coal is valued at about 2,000,000 dollars. M. has upwards of 500 miles of railway. In 1870, there were 1779 schools in the state—1487 public, 72 classical, professional, and technical (including 2 universities and 19 colleges), and 220 boarding and other schools. There were also 1316 public libraries, 88 newspapers, and 1389 churches. M. was settled by a colony of Roman Catholic gentry from England, under a grant to the second Lord Baltimore, 1632, when it received its present name in honour of the English queen, Henrietta Maria. In 1649 it was made, as has been well said, 'a land of sanctuary,' by the toleration of all religious denominations, but the Puritans, expelled from Virginia, made great trouble in the colony. Organised as a state in 1776, M. took a prominent part in the revolution. In the war of 1861, its sympathies were with the South, and the first blood of the war was shed in Baltimore, several Massachusetts volunteers having been killed on their way to Washington. During the war it was invaded from Virginia, and made the scene of bloody conflicts.

**MARYPORT**, a seaport of Cumberland, England, at the mouth of the Ellen, 28 miles south-west of Carlisle by railway. Its origin dates from 1750. Shipbuilding and its kindred employments are carried on extensively, and there are in operation iron-foundries, saw-mills, flour-mills, tanneries, breweries, &c. A very large quantity of coal and coke is shipped, especially to Ireland. M. has abundant railway connection, and possesses a floating dock and two patent slips. It is a place of resort for sea-bathing. In 1872, 700 vessels, measuring 65,394 tons, entered the port, and 2320, measuring 225,872 tons, cleared. Pop. (1871) 7443.

**MARYSVILLE**, a city of California, United States of America, on the north bank of the Yuba River, 100 miles north-north-east of Benicia, and 50 miles north of Sacramento, having steam-boat communication with San Francisco. It is a great resort of gold-miners, and has a variable population, given in the census of 1870 at 4738.

**MASANIELLO** (properly, TOMMASO ANIELLO), a fisherman of Amalfi, was the leader of the revolt which took place in Naples in July 1647 against the Spanish viceroy, the Duke of Arcos. The people had been exasperated by oppression, and great excitement had been produced by a new tax laid upon fruit. M. himself was indignant at the rude

treatment which his wife had received when she was detected in the attempt to smuggle a little flour. He entered into a conspiracy with some others who cherished feelings similar to his own; and an opportunity being afforded them by a tumult at the Customs' Houses on 7th July 1647, when the new tax on fruit was to be levied, they stirred up the multitude to a revolt. Their triumph was complete; palaces and public buildings were destroyed, a bloody popular justice was executed, and the viceroy was terrified into the greatest concessions, and entered into a regular treaty with M. in the church of the Carmelites on 13th July. But success and the flatteries of the viceroy turned the fisherman's head; he gave himself up to drunkenness and every excess, and his capricious despotism immediately became terrible to his own associates, who assassinated him on 16th July. See *Angelo Saavedra, Duke of Rivas, Insurreccion de Napoli in 1647* (2 vols., Madr. 1849).

**MASCARENE ISLES**, or **MASCARENHAS**, the collective name given to islands of Bourdeaux (q.v.), and of Isle-de-France or Mauritius (q.v.). The island of Rodriguez, 360 miles further east, is sometimes reckoned as one of them.

**MASCLE** (from *macula*, the mesh of a net), in Heraldry, a lozenge-shaped figure perforated and shewing a narrow border. The term *mascully* is applied to a field divided by diagonal lines into lozenge-shaped compartments of alternate tinctures, each having its centre voided of the opposite tincture. *Lozengy-mascully* is a field composed of lozenges and mascles alternately. In the earlier heraldry, mascully was used for what was afterwards called lozengy. Crosses and other ordinaries may be formed of mascles, in which case they should begin with half a mascle.

Mascle.

**MAS-ÉNÁ**, a town of Negroland, Africa, capital of the country of Bagirmi, in lat. 11° 35' N., long. 16° E., about 100 miles south-east of Lake Tchad. It covers an area seven miles in circumference, and was formerly much larger. Its present reduced condition has been induced by disastrous civil and foreign wars. Only about half the area of the town is inhabited. The palace of the sultan, who is reported to have from 300 to 400 wives, consists of irregular clusters of clay buildings, and huts surrounded by a wall built of baked bricks. The town is walled, and has nine gates. It has on the whole a dilapidated appearance. Barth's *Travels in Central Africa*.

**MASK** (Med. Latin, *masca*; Fr. *masque*), a disguise or covering of the face, the use of which perhaps originated in the harvest festivities of the Grecian peasantry of the most ancient times, and appears subsequently to have been associated with the representation of Satyrs, Silenus, and Bacchus in the orgies of Bacchus. Greek tragedy having originated in close connection with the worship of Bacchus, masks were employed in it from the first; but it is uncertain when they were introduced in comedy. The masks used by actors were of very various form and character. They were often provided with metallic mouthpieces, for the purpose of increasing the power of the voice, this being rendered requisite by the immense size of the ancient theatres; their whole use being indeed adapted to such vast buildings, and to a style of dramatic representation in which the ideal prevailed, and the reality of individual impersonation was far less thought of than in modern times. Much information on the subject of ancient masks may be

## MASK, MASKED—MASONRY.

in the work of Pacichelli, *De Mascheria, Capitulum et Chirothecia* (Naples, 1693); in the magnificent work of Pietro Contucci Ficoroni, *De Larvis et Figuris Comiciis* (Rome, 1754), and in *De Personis vulgo Larvis seu Mascheris* (1723).

Use of masks in the modern theatre originated in Italian *commedia dell'arte*, which may itself be traced back to the ancient Roman mimes and *atellinae*, and has always been confined to that class of entertainments in which the very names of the characters, *Pantaloone*, *Harlequin*, &c., have been borrowed from Italy.

**MASKED**, a military expression used in various senses. A *masked battery* is one so screened, with grassy glacis, &c., as to be hidden from the view of the enemy, until, to his surprise, it opens fire upon him—on his flank, perhaps. A battery is *masked* when some other body of friendly troops, intervenes in the fire, and precludes the use of the guns. An army or an army is masked when a superior force holds it in check, while some hostile operation is being carried out.

**KELYNE, NEVIL**, an English astronomer and physicist, was born in London, 6th October 1671. He was educated at Westminster School, and then removed to Catherine Hall, and finally to Trinity College, Cambridge, where he gained a fellowship in 1706. In 1708, he was elected a Fellow of the Royal Society, and resolved to devote himself to astronomy. In 1763, he made a voyage to Barbadoes, to test the newly-invented chronometers, and, after his return, was appointed astronomer-royal. During the 46 years that he held this situation, he acquired universal respect by his diligence and the accuracy of his investigations, made several improvements in the instruments and employment of the instruments, and was the first to mark the time to tenths of a second.

In 1744–1746, he made his expedition to Lapland, for the purpose of determining the length of the earth. See **EARTH**. M. was the originator of the *Nautical Almanac* (q.v.), and obtained leave to have his observations published at the expense of government. He published several works out of his official capacity, but of these, no fewer than thirty-five appeared, many of which have been found of immense service (especially *Astronomical Observations*) to subsequent astronomers. M. died 9th February 1811.

**MASKS**, in Architecture, are carved as decorative keystones and other prominent positions.

**MASON AND DIXON'S LINE**, a line running parallel of latitude 39° 43' 26.3", and separating Pennsylvania from Maryland, drawn by distinguished English astronomers and mathematicians, Charles Mason and Jeremiah Dixon. For 40 years after 1681, there were constant disputes between the Lords Baltimore and the Pennsylvanians, the rival proprietors in Pennsylvania and Maryland, in regard to the position of the boundary between their colonial possessions. An agreement was come to in 1760, in accordance with which a commission of surveyors commenced to make out the boundary. The proprietors in London, not understanding the length of time required for the undertaking, and growing impatient, sent Charles Mason and Dixon to complete the surveys, and commenced the work in December 1763. They concluded their task towards the end of 1767, having marked out a line of 244 miles in length, through forests, over mountain ridges, &c. At the end of every fifth mile a stone was planted, each of which was engraved on one side the arms of

Lord Baltimore, on the other those of the Penns. The intermediate miles were marked by smaller stones with an M on one side and a P on the other. All the stones came from England. The surveys were revised in 1849, and found substantially correct.

This line must be distinguished from that of 36° 30', which separated the free and slave states of the original confederation. The latter is also the *compromise line*, which in 1826 was fixed as the most northern limit of such slave states as should be admitted into the Union.

**MASON BEE**, a name given to those species of bee which build their nests of agglutinated earth or grains of sand. See **BEE**. *Megachile muraria* is a British species, black, the wings tinted with violet. The nest is attached to walls or stones in sunny places. The interior contains about a dozen cells, in each of which is deposited an egg, with a piece of paste for the food of the larva. These bees sometimes repair old nests, and have fierce combats for the possession of them.

**MASON WASP** (*Odynerus murarius*), a species of wasp, which makes its nest by boring a cylindrical hole in hard sand, or even in the plaster of walls, on which an exudation from the mouth seems to act

Solitary Mason Wasp (*Odynerus murarius*), and Group of Nests and Larvæ.

so as to soften it sufficiently. At the orifice, an outer tube is constructed, sometimes two or three inches in length, of pellets formed in the excavation. In the interior, an egg is deposited, with a number of little caterpillars ready for food of the larva when hatched.

**MASONED**, in Heraldry, a term used to describe the lines formed by the junction of the stones in building.

**MASONRY**, the art of construction in stone. The earliest existing examples are among the most magnificent specimens of the art. No nation has excelled the ancient Egyptians in stonework, whether we consider the size of the materials, or the unequalled exactness with which they are fitted together. The Egyptians did not use mortar in their important structures such as the pyramids, the joints being all carefully polished and fitted. Cyclopean masonry, of which remains exist in many parts of Greece and Italy, also exhibits stones of great size and with carefully-adjusted joints (fig. 1). The walls of Mycenæ are among the earliest examples. These are built with huge irregular blocks, the spaces

between being filled up with smaller stones. The Etruscan specimens are more carefully executed; the stones are not squared, but they are all care-

Fig. 1.—Wall in Peloponnesus.

fully fitted together. In some cases, the beds or horizontal joints are made level, and the upright joints left unsquared. No mortar is used in cyclopean masonry.

The masonry of the Greeks and Romans very closely resembled that of the present day: *Rubble-work* (*opus incertum*), in which the stones are not regularly coursed; *Coursed-work*, where the joints are all level, and the stones of equal height; *Ashlar*, resembling the latter, but built with larger stones all carefully dressed on the joints. Many of the Roman buildings in the Eastern Empire were constructed with blocks of enormous size, as at Baalbec, where some of the stones are sixty feet in length. Ashlar-work is frequently used for the exterior surface of walls, the inside being 'backed up' with rubble-work. This kind of work is sufficient for ordinary purposes; but where great strength is required, the whole thickness must be built with solid blocks. Ashlar-work is generally bedded in fine mortar, with one inch of oil-putty on the outer edge.

The early medieval masonry was of very bad construction, being, in fact, little better than common rubble, with an occasional use of Herring-bone Work. The Normans improved upon this kind of work, but their masonry was also so bad, that most of the towers built by them either fell or had to be taken down. The fall of the tower of Chichester Cathedral, a few years ago, was occasioned by defective Norman masonry. The art gradually improved with the advance of Gothic architecture, and ashlar was reintroduced for all important works. The ashlar-work so constantly used in Renaissance buildings, has lately given place to a more picturesque style of masonry called hammer-dressed and squared work—the money saved upon this cheaper work being applied with good effect in improving the appearance of the doors, windows, and other prominent features of the buildings.

Fig. 2.—Flint Panelling from Fakenham Church, Norfolk.

There is one very simple rule, too little attended to in modern masonry—viz., that all stones, at

least when stratified, should be laid on a *natural bed*, for if set on edge, they are as scale off and decay under the influence of weather.

Special materials sometimes produce special of work; thus, in Norfolk and Suffolk, when flints abound, the walls are often faced with split so as to form a clean face and good joint arranged in bands or panels between stone or brickwork (fig. 2). In Aberdeenshire, granite is the usual building material, ashlar is almost universal, large blocks being more obtained and dressed than smaller ones. where rag-stone only can be got, it is frequently used in a similar manner to the flint described.

**MASONS, FREE.** The mason brotherhood of the middle ages were organised into corporations substantially different in their nature from the guilds, governed by rules of their own, and recruited from a body of apprentices who had undergone a period of probationary servitude. Fable and tradition have traced back the origin of freemasonry to the old Roman Empire, the Pharaohs, the Ten Solomon, or even the times of the Tower of Babel and of the Ark of Noah. The masonic craft reality sprang into being about the same time from the same set of causes, as other incorporated crafts; but a variety of circumstances combined to give it an importance and influence beyond those of the other crafts. Men skilled in the hewing and setting of stone were naturally prized in an eminently church-building age. Their vocation necessarily involved travelling from place to place in search of employment. Wherever a great church or cathedral was being built, the local masons had to be reinforced by a accession of craftsmen from other parts; and masons from neighbouring towns and districts flocked to the spot, and took part in the building. They lived in a camp of huts reared beside the building on which they were engaged. A master presided over the whole, and every tenth man was a *warden*, having surveillance of the rest. A mason, after going through his apprenticeship and journeyman's stage, could not settle down, like another craft, among his neighbours and acquaintances, but had to travel from place to place to find employment; hence it became desirable or necessary to have some means by which a person once a member of the fraternity might be universally accepted as such without requiring, wherever he went, to give evidence of his skill, or having to undergo a re-examination on his qualifications. In order to accomplish this end, and to enable a mason to claim to his work to claim the hospitality of brother-masons on his way, a system of symbols was devised, in which every mason was initiated, and which he was bound to keep secret. This symbolism, invented for the convenience of intercourse between members of the same craft, has become the sole shadow of foundation for the popular notion that the masonic brethren were in possession of secrets of vital importance, the knowledge of which had been from generation to generation confined to their own order. It has been supposed that the possession of the masonic secrets enabled them to design the great cathedrals of the 13th and 14th centuries, whereas it is now certain that during the purest ages of Gothic architecture, both in France and in England, the architects were not members of the masonic fraternity at all, but either laymen of skill and taste, uninitiated in the mysteries of the craft, or oftener bishops and abbots. The men who worked from the architect's designs were at the same time, not the mere human machines of modern workmen too generally are, but men

## MASONS.

ying out an idea imparted to them, could an individuality of their own on every stone. Architecture was then a progressive art, and the architect of every great church or cathedral had himself acquainted with the works of his masters, and profited by experience, adopting beauties, and shunning their defects. The progress of the advance which architecture was then making, has been compared by Mr Fergusson to the advance with which we are familiar in the day in ship-building and other useful arts. As to the masons nor to their employers, nor Abbé Suger, Maurice de Sully, Robert de Caes, nor Fulbert de Chartres, is the whole to be ascribed, but to all classes of the French society carrying on steadily a combined movement towards a well-defined end.' In Germany, too, the masons of the 14th c., who had attained wonderful skill in carving and in constructing overstepping their original functions, took to the extent the office of architect into their own hands, and it is undeniable that the churches built by German masons, though rich in the exquisite workmanship, are not comparable, in higher elements of beauty, to the works of classic architects.

The epithet 'Free' was applied to the craft of masons in consequence of their being exempted by papal bulls from the laws which regulated the labourers, and exonerated from various taxes thrown on the working-classes at large in England and on the continent. Like all the guilds, the masons were bound by their rules to the performance of specific religious duties; but one of whose principal functions was church-building, was naturally under the more especial patronage of the clergy. Yet a considerable time after the Reformation, we find the jealousy of the laity excited from time to time by the masonic functions, partly in consequence of their assuming functions besides those of mere builders. In 1534, an act, passed in the minority of Henry VIII., instigated by Henry of Beaufort, Cardinal of Winchester, prohibited the masons from holding convent chapters and assemblies. But this act was never enforced; and Henry VI., on coming of age, himself countenanced the masons, and was a member of the fraternity. Henry VII. became their Grand Master in England.

The history of freemasonry has been overlaid with fiction and absurdity, partly from an exaggerated estimate of its importance in the development of architecture, and partly from a wish to connect medieval masonry with the institution that bears the same name in the present day. (or so called 'speculative') freemasonry is a recent mystification unconnected either with building craft or with architecture. It is of modern origin, and dates from the 17th century. According to the peculiar phraseology of the masonic system, it is founded in the 'practice of moral and virtue'; its distinguishing characteristic is its 'in its most extended sense; and brotherly love, and truth are inculcated by its precepts. Its founders were Elias Ashmole and some of his early friends, who amused themselves by devising a set of symbols, borrowed in part from the Knights Templars, between whom and the old masons an intimate relation is said to have subsisted, partly from the Rosicrucians (q.v.). These symbols, which have since been adopted as the distinguishing badge of the brotherhood of 'Free Accepted Masons,' include the sun, the moon, the compasses, square, and triangle. A number of degrees or grades of masonry with fantastic names were established and conferred on the mem-

bers.\* Charles II. and William III. were masons; and the appearance of a connection with operative masonry was kept up by the appointment of Sir Christopher Wren to the office of Grand Master. The 'Lodges' of Scotland profess to trace their origin to the foreign masons who came to Scotland in 1150 to build Kilwinning Abbey; those of England go still further back, to an assemblage of masons held by St Alban, the proto-martyr, at York in 926; and the mother-lodges of York and Kilwinning were, with insignificant exceptions, the parents of all the several lodges erected in different parts of Great Britain. Towards the close of last century, it was in some quarters made a charge against freemasonry, that under its symbolism was concealed a dangerous conspiracy against all government and religion. The accusation was probably groundless enough, and so little effect was produced by it, that, in an act passed in 1799 for the suppression of secret societies, an exception was made in favour of freemasons. In 1717, a Grand Lodge was formed in London, with power to grant charters to other lodges. Under its sanction, the first edition of the constitutions of the fraternity was published. The Grand Lodge was for a length of time on an unfriendly footing with the lodge of York, in consequence of having introduced various innovations not approved of by the older lodge, and of having granted charters within the district which York claimed as its own. In 1742, the Duke of Cumberland was elected Grand Master of the Grand Lodge; and on his death, George IV., then Prince of Wales, succeeded to the office, which he continued to hold till he was appointed Regent, when, it being considered unsuitable that he should longer exercise any personal superintendence, he took the title of Grand Patron. In 1813, an understanding and a union was brought about between the two rival lodges by their respective Grand Masters, the Dukes of Kent and Sussex. The fraternity has since been managed by the 'United Grand Lodge of Ancient Free and Accepted Masons of England,' consisting of the Grand Master, with his Deputy, Grand Wardens, and other officers, the provincial Grand Masters, and the Masters and Wardens of all regular lodges, with a certain number of stewards annually elected, who meet four times a year for the despatch of business, besides which there is an annual masonic festival, at which every mason is entitled to attend. The Grand Lodge of England has at present above a thousand lodges under its protection, and has given away large sums for philanthropic objects.

In Scotland, the Grand Mastership of the masons, when they were a real company of artificers, was for a considerable time hereditary in the family of the barons of Rosslyn, and annual meetings of the fraternity were held at the town of Kilwinning. On the introduction of modern masonry, William St Clair of Rosslyn was made Grand Master of all Scotland, and the Grand Lodge of Scotland was instituted in 1736. The masons of Scotland held communication only with the more ancient English masons till 1805, when they established an alliance also with the Grand Lodge of England, and elected the Prince of Wales their Grand Master. In 1744, masonic 'brotherly love' was interrupted by a dispute between the Kilwinning Lodge and the lodge of the Chapel of St Mary, each claiming the post of honour as the oldest lodge in Scotland. The Grand Lodge decided in favour of the latter, as being

\* The three principal grades are apprentice, fellow-craft, and master-mason; there being peculiar ceremonies at the making of each; and it is only on attaining to the degree of master-mason, that a brother enjoys the full benefits and privileges of the craft.

possessed of the older charter; and the Kilwinning Lodge feeling aggrieved, withdrew from the control of the Grand Lodge, and established the 'Grand Chapter of the Royal Order of Kilwinning.' The Grand Mastership of Scotland is now held by the Duke of Athole.

Besides granting charters of affiliation, the chief use of the Grand Lodge, whether of England or Scotland, consists in its acknowledged authority to enforce uniformity of ceremonial and other observances, and to settle all disputes that may arise within the lodges under its charge. The officers of the Grand Lodge are to a large extent delegates from the respective lodges; the delegation being in the form of proxy masters and wardens. As a source of revenue for each master made by a lodge, a fee must be remitted to the Grand Lodge, whereupon a diploma of brotherhood will be issued.

Modern freemasonry spread from Britain to the continent. Lord Derwentwater and other Englishmen introduced it into France in 1725, where it established itself, although discountenanced by Louis XV. and by the clergy. In 1756, the French masons became independent of the English Grand Master; and in 1772, the two grand lodges of 'Le Grand Orient' and 'La Grande Loge de France' were formed, which became united in 1799. There are now above 300 lodges in France, about a fourth of which are in Paris. In Russia, masonry, introduced by the English in 1731, was encouraged by the Empress Catharine II., and to a greater extent by the Emperor Alexander, who was himself initiated. Masonic institutions have also existed in Spain and Italy, generally under the ban of government, and sometimes of the Inquisition. Under the auspices of English and Scotch Grand Lodges, masonry has also obtained a footing in Holland, Poland, Denmark, Hungary, Sweden, Prussia, India, and America.

The deep symbolical meaning supposed to be couched under the jargon of the masonic fraternity, is probably as apocryphal as the dangers of masonry to government and order. A set of pass-words, and a peculiar grip of the hand, enable the initiated to recognise each other, and give a zest to their convivial meetings; and if the institution possesses any practical utility, it is in its enabling a mason in a place where he is a stranger to make himself known to his brother-masons, and claim their protection and assistance. The mysteries of the craft have recently been so far encroached on, that the Grand Master has given leave to the *Free Masons' Magazine* to publish reports of the proceedings of grand and private lodges.

MASQUE, a species of dramatic performance, much in vogue in England towards the close of the 16th and the beginning of the 17th century. It was, in fact, the favourite form of private theatricals at the time. The masque appears to have originated in the practice of introducing, in any solemn or festive processions, men wearing masks, who represented either imaginary or allegorical personages. At first, it was simply an 'acted pageant,' as in the well-known progresses of Queen Elizabeth; but gradually it expanded into a regular dramatic entertainment, and in the hands of men like Fletcher and Ben Jonson attained a high degree of literary beauty. Jonson's masques were represented at court, and were greatly relished. The taste for this kind of amusement, however, died away in the reign of Charles I.; nevertheless, to the time of that monarch belongs the finest masque, and one of the most splendid poems ever written—the *Comus* of Milton (1634). See Masson's *Life of Milton* (vol. i. page 542, et seq.).

MASQUERADE, or MASKED BALL, a meeting in which the host and guests assume various characters, and disguise themselves less for the occasion, the name being derived from the use of the mask. The public masquerade was formerly very common in France, and in former times, Easter plays, Festivals of the Kings, which were frequent in most parts of Europe, somewhat various in different countries, suggested the idea of the masquerade, which, however, was not open to all, according to the understood rules of these ancient amusements. The public masquerade was limited to some select class, or to those who paid a certain sum for admission. Catharine de Medici introduced the regular masquerade at the French court. It found its way to England in the reign of Henry VIII., but did not reach the courts of Germany till the end of the 17th century. The *bal costumé* is a very modified and objectionable form of the masquerade. In Italy, at Carnival, public masquerades are held in theatres and dancing-saloons of Paris, and these occasions scenes of the most dissipated and dissolute life are said to be enacted, in spite of the supervision of the police.

MASS (Lat. *Missa*), the name given in the Catholic Church to the Eucharistic service. In that church, as well as in the Greek and oriental churches, it is held to be the fulfilment of the new law, a real though unbloody sacrifice, in which Christ is the victim, in substance, with the sacrifice of the cross, and in commemoration of that sacrifice, and as a means of applying its merits, through all ages, for the sanctification of men. The doctrine of the Eucharist, understood by Roman Catholics, presupposes the Eucharist, although the latter doctrine necessarily involve the notion of a sacrifice. The Eucharist may even be held by those who deny the official character of the Eucharistic rite. The arguments for and against this belief, on which the Mass is founded, do not fall within our limits. We here give a brief history and explanation of the rite, as it is found among Catholics, the members of other communions in which it is observed. Without entering into discussion of the primitive character of the Eucharist, it will be enough to observe that the very records of Christian history, whether in the writings of the Apostles, the canonical Epistles, or the writings of the most ancient of the Fathers, evince the existence from the beginning, and which it is impossible not to regard as in character identical with that which still exists in most Christian communities the chiefest and most solemn part of their public worship. It is believed by Roman Catholics to have been instituted by Christ as a sacrifice, partly a communion and partly a sacrifice, and of the names thereof by the faithful; and of the names it is called in the works of the early Fathers, as, for example, *agape*, and *hagia synaxis*, &c. The latter, while others—as *thusia*, *prophora*, &c.—indicate the former signification. The meaning of the name now in use is somewhat obscure, but it is commonly referred to the prayer made by the deacon at the close of the Mass: 'Ite; missa est' ('Go; the assembly is dismissed'). By primitive use, the communion of the Eucharist appears always, unless in exceptional cases, as formed part of the Eucharistic service; and towards it came to pass that the officiating priest only communicated, whence arose, especially in the Western Church, the practice of 'private Mass,' which has been in later times a ground of complaint with dissentients from Rome, even in other respects approach closely to the doctrine. In the ancient writers, a distinct

# MASSA DUCALE—MASSACHUSETTS.

made between the 'mass of the catechumens' and the 'mass of the faithful'; the former including all the preparatory prayers, the latter all that directly regards the consecration of the elements and the communion, at which the 'discipline of the secret' forbade the presence of the catechumens. With the cessation of this discipline, the distinction of names has ceased, but the distinction of parts is still preserved, the mass of the catechumens comprising all the first part of the Mass as far as the 'preface.' The Mass is now in general denominated according to the solemnity of the accompanying ceremonial, a 'Low Mass,' a 'Chanted Mass,' or a 'High Mass.' In the first, a single priest simply reads the service, attended by one or more acolytes or clerks. The second form differs only in this, that the service is *chanted*, instead of being read by the priest. In the High Mass, the service is chanted in part by the priest, in part by the deacon and sub-deacon, by whom, as well as by several ministers of inferior rank, the priest is assisted. In all these, however, the service, as regards the form of prayer, is the same. It consists of (1) an introductory prayer composed of the 41st Psalm, together with the 'general confession'; (2), the Introit, which is followed by the thrice-repeated petition, 'Lord, have mercy,' 'Christ, have mercy,' and the hymn, 'Glory to God on high'; (3), the collect, or public and joint prayers of priest and people, followed by a lesson either from the Epistles or some book of the Old Testament, and by the Gradual (q. v.); (4), the gospel, which is commonly followed by the Nicene Creed; (5), the OFFERTORY (q. v.), after the reading of which comes the preparatory offering of the bread and wine, and the washing of the priest's hands, in token of purity of heart, and the 'secret,' a prayer read in a low voice by the priest; (6), the preface, concluding with the *trismion*, or 'thrice holy'—at which point, by the primitive use, the catechumens and penitents retired from the church; (7), the 'canon,' which is always the same, and which contains all the prayers connected with the consecration, the elevation, the breaking, and the communion of the Host and of the chalice, as also the commemorations both of the living and of the dead; (8), the 'communion,' which is a short scriptural prayer, usually appropriate to the particular festival; (9), the 'post-communion,' which, like the collect, was a joint prayer of priest and people, and is read or sung aloud; (10), the dismissal with the benediction, and, finally, the first chapter of St John's gospel. Great part of the above prayers are fixed, and form what is called the 'ordo' or 'ordinary' of the Mass. The rest, which is called the 'proper of the Mass,' differs for different occasions; some masses being 'of the season,' as of Lent, Advent, Passion-tide, 'Quarter-time,' &c.; others, of 'Mystery,' as of the Nativity, the Circumcision, the Resurrection; others, again, of saints, as of an Apostle, a Martyr, or a Confessor; others, again, 'votive,' as 'of the Passion,' 'of the Dead,' 'for Peace,' &c. In all these various classes, as well as in the individual masses under each, the 'proper' portions of the Mass differ according to the occasion, and in some of them certain portions of the 'ordinary,' as the 'Glory to God on high,' the 'Gradual,' or the 'Nicene creed,' are omitted. On one day in the year, Good-Friday, is celebrated what is called the 'Mass of the Presanctified,' in which no consecration takes place, but in which the priest communicates of the Host which was consecrated on the preceding day. This usage is found also in the Greek Church, not alone on Good-Friday, but on every day during the Lent, except Saturday and Sunday. In the celebration of Mass, the priest wears peculiar vestments, five

in number—two of linen, called 'amice' and 'alb,' and three of silk or precious stuffs, called 'maniple,' 'stole,' and 'chasuble,' the alb being girt with a cincture of flaxen or silken cord. The colour of these vestments varies with the occasion, five colours being employed on different occasions—white, red, green, purple or violet, and black; and they are often richly embroidered with silk or thread of the precious metals, and occasionally with precious stones. The priest is required to celebrate the Mass fasting, and, unless by special dispensation, is only permitted to offer it once in the day, except on Christmas-day, when three masses may be celebrated.

In the Greek and Oriental churches, the Eucharistic service, called in Greek *Theia Leitourgia* (The Divine Liturgy), differs in the order of its parts, in the wording of most of its prayers, and in its accompanying ceremonial, from the mass of the Latin Church (see LITURGY); but the only differences which have any importance as bearing upon doctrine, are their use of leavened bread instead of unleavened; their more frequent celebration of the 'Mass of the Presanctified,' to which reference has already been made; the Latin use of private masses, in which the priest alone communicates; and, in general, the much more frequent celebration of the Mass in the Latin Church. The sacred vestments, too, of the Greek and Eastern rites differ notably from those of the Latin; and in some of the former—as, for example, the Armenian—a veil is drawn before the altar during that part of the service in which the consecration takes place, which is only withdrawn at the time of the communion. The service sometimes used on ship-board, and improperly called *Missa Sicca* (Dry Mass), consists simply of the reading of the prayers of the mass, but without any consecration of the elements. It was resorted to with a view to avoiding the danger of spilling the sacred elements, owing to the unsteady motion of the ship. It is sometimes also called *Missa Nautica* (Ship Mass).

MA'SSA DUCALE, or DI CARRARA, so called to distinguish it from the many towns of the same name, is a small city of Northern Italy, 58 miles south-west of Modena, and formerly capital of the duchy of Massa-Carrara. Pop. 5000. It is a bishop's see, has a public library, a literary institute, a cathedral, and a ducal palace. M. stands in a beautiful situation, sheltered by a background of mountains, and surrounded by a district productive in oranges, citrons, and vast olive-groves.—In the middle ages, the duchy of M. was held by a succession of feudal lords, and passed to the House of Este, Dukes of Modena, towards the close of the 18th century. Bonaparte invested his sister, the Princess Eliza, with the principality of M. and Carrara; but in 1829 it was reunited to Modena, and in 1860 became a province of the kingdom of Italy. Pop. (1871) 161,994.

MA'SSA LUBRENSE, a pleasant Italian town, 17 miles south of Naples by sea. Pop. 8168. M. stands amidst the loveliest scenery of Italy, and is built on a cliff projecting into the sea, and commanding a fine view of the Bay of Naples. It dates from the early Greek period, and contains many remains of Roman antiquities. It is famed for the beauty of its women.

MASSACHUSETTS, one of the thirteen original states of the American Union, and oldest of the New England States, lies between lat. 41° 15'—42° 53' N., and long. 69° 56'—73° 32' W., being 160 miles from east to west, and from 47 to 110 from north to south, with an area of 7800 square miles; it lies south of Vermont and New Hampshire,

# MASSACHUSETTS BAY—MASSILLON.

and borders on the Atlantic. There are 14 counties, and the chief towns are Boston, the capital, Lowell, Lawrence, Newburyport, Salem, New Bedford, Charlestown, Cambridge, and Worcester. On the south-eastern coast are the islands of Nantucket and Martha's Vineyard. The principal rivers are the Connecticut, Merrimac, and Housatonic, which afford water-power to many manufacturing cities and villages. The country is hilly, and much of the soil sterile, but in the river-valleys it is fertile. The most important mineral products are granite and syenite, sand for glass, and iron. The chief agricultural products are Indian corn, apples and pears, grass and hay; but the manufactures are very large and various. In 1870, there were 194 cotton-mills producing goods to the value of \$59,679,153, and 182 woollen-mills producing goods worth \$39,489,242, besides numerous carpet-mills, iron-foundries, rolling-mills, nail factories, and machine-shops. The manufacture of boots and shoes for the same year was \$86,565,445. There are 49 railway companies, and in Jan. 1872, 1600 miles of railway were open for traffic. There are over 200 national banks, about 130 savings-banks, numerous asylums, 8 private charitable establishments, a state prison, 21 county prisons, &c. In 1870, there were 5160 public schools, 50 academies, a university and 6 colleges, and 509 other schools; 1764 churches, and 153 newspapers.—M. was discovered by the Cabots in 1497. In 1614, it was visited by Captain John Smith. In 1620, the *Mayflower*, 180 tons, sailed from Southampton with 102 Puritan settlers, and landed at Plymouth, M., December 22. Half died from cold and hardship the first year. In 1637, the colony suffered from Indian massacres; and in King Philip's war, 1675, 12 towns and 600 houses were burned. The war of the Revolution of 1776 began in M. with the battles of Lexington and Bunker Hill. Pop. in 1810, 472,040; in 1860, 1,231,065; in 1870, 1,459,351.

**MASSACHUSETTS BAY**, an indentation on the eastern coast of Massachusetts, between Cape Cod and Cape Ann, 70 miles long and 25 miles wide, but including in its irregular form Plymouth Bay, Cape Cod Bay, and several others, with numerous small islands.

**MASSAFRA**, a town of the Italian province of Otranto, 11 miles north-west of Taranto, situated in a plain in the midst of hills more productive than salubrious. Pop. 9100. Its site is partly that of the ancient *Messapia*, from which the whole district takes its name.

**MASSA'GETÆ**, a nomadic people, who inhabited the broad steppes on the north-east of the Caspian Sea, to the northward of the river Araxes or Jaxartes. Herodotus says that they had a community of wives; that they sacrificed and devoured their aged people; that they worshipped the sun, and offered horses to him; that they lived on the milk and flesh of their herds, and on fish; and fought on horseback and on foot with lance, bow, and double-edged axe. Cyrus is said to have lost his life in fighting against them, 530 B.C. Niebuhr and Böckh are of opinion that they belonged to the Mongolian, but Humboldt and others, to the Indo-Germanic or Aryan family.

**MASSENA**, **ANDRÉ**, Duke of Rivoli, Prince of Essling, and a marshal of France, was born at Nice, 6th May 1758. In his youth, he served as a ship-boy in a small vessel, and afterwards 14 years in the Sardinian army, but left it because his plebeian birth precluded him from promotion. Early in the French Revolution, he joined a battalion of volunteers, and soon rose to high military rank. In

December 1793, he was made a general of division. He greatly distinguished himself in the campaigns in Upper Italy. After Jourdan's defeat at Stockach on 25th March 1799, the chief command of the army in Switzerland devolved on him in circumstances of great difficulty, but he kept his ground against the Archduke Charles, and finally, by his victory over the Russians at Zürich, 25th September 1799, freed France from the danger of invasion. After the battle of Marengo, Bonaparte gave him the command of the army of Italy. In 1804, he was made a marshal of the empire. In 1805, he again commanded in Italy; and subsequently he signalled himself in the terrible contest for the village of Aspern (q. v.). In 1810, he was intrusted with the chief command in Spain, and compelled the British and their allies to fall back to Lisbon; but being unable to make any impression on Wellington's strong position at Torres Vedras, he resigned his command. He offered his services, however, again, when Napoleon was preparing for the Russian campaign, but was only intrusted with the command in Provence, and in this position he remained till the Restoration, when he gave in his adhesion to the Bourbons, and was made a peer. On Napoleon's return from Elba, he invited M. to follow him, but received as response. After the second Restoration, M. retired into private life. He died 4th April 1817. M. was one of the ablest of Napoleon's generals, but he was as extortionate as a Roman praetor. His master called him a robber, and is said to have offered him a present of 1,000,000 francs if he would give up speculation!

**MASSICOT**, a mineral, occurring in shapeless masses of a yellow colour, brittle, with earthy fracture. Chemically, it is protoxide of lead. It is used as a pigment.

**MASSILLON**, **JEAN BAPTISTE**, one of the most distinguished of modern pulpit orators, was born at Hières, in France, June 24, 1663. His father, a notary, designed the boy for his own profession; and it was only after repeated and persistent efforts, that M. obtained his father's permission to enter the congregation of the Oratory in 1681. It was while he was engaged in teaching theology in one of the houses of the congregation in the diocese of Meaux, that he made his first essay in the pulpit at Vienne. His funeral oration on M. Villars, the Archbishop of Vienne, was eminently successful, and led to his being called by the superiors of the Oratory to Paris, where he first had the opportunity of hearing Bourdaloue, whose style and manner, without being exactly taken by M. as a model, had great influence in forming the taste of the young aspirant. Like Bourdaloue, he avoided the declamatory manner and theatrical action then popular in the French pulpit; but the earnest impressiveness of his look and voice more than supplied the vigour and energy which other speakers sought from these adventitious aids. His course of ecclesiastical conferences, delivered in the seminary of St Magloire, established his reputation. The criticism of Louis XIV., after his Advent course at Versailles, that 'when he heard other great preachers, he felt satisfied with them, but when he heard M., he felt dissatisfied with himself,' well expresses the characteristics of the eloquence of this great orator, who, more than any of his contemporaries, was able to lay bare the secret springs of human action, and to use the feelings and the passions of his audience as arms against themselves. He was again appointed to preach the Lent at Versailles in 1704; but, although the king was again equally warm in his admiration of the preacher, M. was never afterwards invited to preach in the presence of

this monarch; yet his funeral oration on the Prince de Conti, in 1709, was one of the greatest triumphs of his oratory. Soon after the death of Louis XIV., M., in 1717, was named Bishop of Clermont, and in the same year, was appointed to preach before the young king, Louis XV., for which occasion he composed his celebrated *Petit Carême*—a series of ten sermons. It was not till 1719 that he was consecrated Bishop of Clermont, in which year also he was elected a member of the Academy; and in 1723, he preached the funeral oration of the Duchess of Orleans, his last public discourse in Paris. From this time he lived almost entirely for his diocese, where his charity, gentleness, and amiable disposition gained him the affections of all. He died of apoplexy in 1742, at the age of 79 years. His works, consisting mainly of sermons and other similar compositions, were collected, in 12 vols., by his nephew, and published in 1745—1746; later editions are those of Beaucé (4 vols. 1817), Mequignon (15 vols. 1818), and Chalandre (3 vols. 1847).

MASSINGER, PHILIP, an English dramatist, was born in 1584, at or near Wilton, it is supposed, the seat of the Earls of Pembroke, of which family his father was a retainer. Of his boyish days, and of the place of his education, nothing is known. From his plays, we are, however, certified that he was a classical scholar. He entered St Alban's Hall as a Commoner in 1602, and quitted the university suddenly, and without obtaining a degree, on the occasion, it is surmised, of his father's death. After leaving Oxford, his career cannot be clearly traced. He came to London, and wrote for the stage, sometimes on his own account, frequently—as was the fashion of the time—in conjunction with others. He produced many plays, the dates of which are obscure. He seems to have lived in straitened circumstances, and to have been of a melancholy turn of mind. On the morning of the 16th March 1640, he was found dead in his bed. He was buried in the churchyard of St Saviour's, by the hands of the actors. In the parish register stands the pathetic entry: 'March 20, 1639—1640, buried Philip Massinger, a stranger.'

Taken as wholes, M.'s plays do not strike one much; their merits consist in detached passages. He was of a grave and serious mood, and his reflective passages rise into a rich elaborate music. His finest writing is contained in *The Virgin Martyr*, but his best plays are *The City Madam*, and *The New Way to Pay Old Debts*—the last of which has even yet some slight hold on the stage. The best edition of his works is that by Gifford (Lond. 1805, reprinted 1815).

MASSO'RAH, variously derived from *massar* (to hand down to posterity—tradition), and *assar* (to bind, to fix within strict limits), denotes chiefly a certain collection of critical notes on the text of the Old Testament, its divisions, accents, vowels, grammatical forms, letters, &c.; all the more necessary for the more accurate preservation of the sacred documents, as, according to the early mode of Shemitic writing, only the consonants, and these without any stop or break, were put down; a proceeding which, in the course of time, must naturally have produced a vast number of variants, or rather different ways of reading and interpreting the same letters, by dividing them into different words with different vowels and accents. The origin of the M., which, by fixing an immutable reading upon each verse, word, and letter, put an end to the exercise of unbounded individual fancy—which, for homiletical purposes alone, was henceforth free to take its own views—is shrouded in deep mystery. The

first traces of it are found in certain Halachistic works treating of the synagogue rolls of the Pentateuch, and the mode of writing them. Some of the earliest works on the subject have survived in their titles only, such as *The Book of the Crowns*, *The Book of the Sounds*, &c., attributed to the Soferim, or Masters of the Mishna (q. v.). There can hardly be a doubt that the Massorah, like the Halacha and Haggada, was the work, not of one age or century, but of many ages and centuries, as, indeed, we find in ancient authorities mention made of different systems of accentuation used in Tiberias, Babylon (Assyria), and Palestine. It was in Tiberias also that the M. was first committed to writing between the 6th and 9th c. A.D. Monographs, memorial verses, finally, glosses on the margins of the text, seem to have been the earliest forms of the written M., which gradually expanded into one of the most elaborate and minute systems, laid down in the 'Great Massorah' (about the 11th c.), whence an extract was made known under the name of the 'Small Massorah.' A further distinction is made between M. *textualis* and *finalis*, the former containing all the marginal notes; the latter, larger annotations, which, for want of space, had to be placed at the end of the paragraph. The final arrangement of the M., which was first printed in Bomberg's Rabbinical Bible (Ven. 1525), is due to Jacob ben Chajim of Tunis, and to Felix Pratensis. The language of the M. is Chaldee, and besides the difficulty of this idiom, the obscure abbreviations, contractions, symbolical signs, &c., with which the work abounds, render its study exceedingly hard. Nor are all its dicta of the same sterling value; they are not only sometimes utterly superfluous, but downright erroneous. Of its 'countings,' we may adduce that it enumerates in the Pentateuch 18 greater and 43 smaller portions, 1534 verses, 63,467 words, 70,100 letters, &c.—a calculation which is, however, to a certain degree at variance with the Talmud.—An explanation of the M. is found in Elijah Levita's (q. v.) *Masoreth Hammasoreth* (transl. into German by Semler, Halle, 1772), and Buxtorf's *Tiberias* (Basel, 1620), a work abounding with exceedingly curious information on the text of the Old Testament.

MAST, an upright, or nearly upright spar, resting on the Keelson (q. v.) of a ship, and rising through the decks to a considerable height, for the purpose of sustaining the yards on which the sails are spread to the wind. It is usually in joints or lengths, one above the other, the lowest and strongest being the *mast* proper, distinguished by its position as the fore, main, or mizzen mast. Above this come successively the *top-mast*, the *top-gallant-mast*, the *royal-mast*, and—though very rarely used—the *sky-scraper*. The full height of all the masts together, in a first-rate ship of war, is about 250 feet. As, when a strong wind is blowing, the pressure upon the canvas carried by a mast amounts to many tons, the mast itself must be of great strength. In some modern vessels, hollow iron masts are used, with success, it is said, as being much lighter than those of wood; but the majority are of Norway fir of the best quality. In small vessels, the mast is made of one tree; but it is considered stronger when 'a made mast,' that is, when constructed of several pieces riveted together, and strengthened by iron hoops. The mast is sustained, when fixed, by the shrouds, as supports on each side, by the Stay (q. v.) in front, and the back-stays behind.

MASTER, in the Royal Navy, was an officer ranking with, but junior to, lieutenants, and engaged

## MASTER—MASTER AND SERVANT.

with the details of sailing the vessel, under the general orders of the captain. In recent years the title has been changed to 'navigating lieutenant;' the change of name carrying, in several particulars, an improved status. It is his duty to take charge of such of the ship's stores as are not under the paymaster; in short, he is the navigator and store-keeper for the vessel; as such, holding a most responsible and onerous position. For his assistants, he has the junior officers in his own department—the navigating sub-lieutenants, navigating midshipmen, and navigating cadets—and the ship's quartermasters. The full pay of a navigating lieutenant, exclusive of store and other allowances, ranges from 12s. to 22s. a day; of a navigating sub-lieutenant, from 5s. to 7s. 6d.; and of a navigating midshipman, from 3s. to 4s. a day; while as alpha and omega, the staff-captain has 22s. a day; and the navigating cadet, 1s. a day (which is, of course, meant merely for pocket-money).

In the Merchant Navy, the master of a vessel, usually, by courtesy, denominated the captain, is the officer commanding her. His duties comprise the maintenance of discipline, the sailing of the ship, the charge of her cargo, and many other mercantile functions. His responsibilities to the ship's owners are of course settled by distinct agreement, applicable to the special case. Towards the public, however, many acts of parliament determine his responsibility. The master is bound to come to a written agreement with each of his men, before sailing, as to the wages to be paid. He is bound to bring home and subsist (to the number of four for every ten tons), seafaring persons—British subjects—who may have been cast away, captured by the enemy, or by other unavoidable accident left upon a foreign shore; for these he is granted head-money by the Admiralty. The master is compelled to keep a proper log-book, and must produce it, with his ship's papers, on the requisition of the commander of a ship-of-war of his own nation. Masters of vessels of a certain size are required to obtain certificates of qualification from the Board of Trade. Certificated masters are eligible for the ROYAL NAVAL RESERVE (q. v.), with the rank of lieutenant.

**MASTER** (Ger. *Meister*, Lat. *magister*, from *magis*), one who rules, governs, has servants under him. As a complimentary appellation of respect, it is prefixed to the Christian name and surname, or surname simply, contracted into Mr in writing, and pronounced 'Mister.' The eldest son of a baron in the peerage of Scotland is generally known by the title of the 'Master of —,' prefixed to his father's title of peerage.

**MASTER AND SERVANT.** The relation of master and servant is constituted in Great Britain entirely by contract; for there being no status of slavery recognised in law, one person can only serve another with his or her own free consent. Being a mere contract, it may, like other contracts, be broken at will, subject only to the usual consequence, that the party in the wrong is liable to pay damages for the breach. In England and Ireland, the engagement or hiring of a servant may be either verbal or in writing; but if the engagement is for more than one year, it must be in writing. If for an indefinite time, no writing is necessary. When a servant continues in the service after the first year, a renewal of the contract is presumed on the same terms. Sometimes it is difficult to say whether an engagement of an indefinite kind is by the year, or by the month or week; in such cases, a material fact is how the wages were to be paid, for if they are paid weekly, the presumption will be that the hiring was by the week, unless there are other

circumstances to shew that a yearly hire meant. The difference between a yearly and a weekly one is, that if the servant is dismissed without cause during the year, he is entitled to wages up to the end of the year; and on the other hand, if he leave without cause during the year, he is entitled to no wages at all.

A servant undertakes to have competence for the duties of the service, and is bound to exercise due diligence, and to conduct himself respectfully. He is bound to obey all lawful orders of his master during the engagement, if they are within the scope of the particular service for which he was hired. Thus, a coachman is not bound to do the duties of a cook, and *vice versa*. Every servant is bound to take due care of his master's property, and is liable to an action at the suit of his master for gross negligence, and also for fraud and misfeasance. A master is not entitled to chastise a servant, whatever the age of the servant may be, in the case of an apprentice under age, a corporal chastisement is justifiable. The grounds on which a servant may be lawfully discharged are disobedience, gross immorality, habitual neglect, and incompetence. If any person entices a servant, and thereby cause loss to the master, the latter may sue such person for the injury. If a servant is a female, and is seduced, and is unable to continue her service, the master may also bring an action against the seducer for any loss of service caused thereby; and the same principle a master may bring an action against a third party who causes personal injury to the servant. In the case of the bankrupt master, a preference is given to the servant if due and unpaid, but this extends only to the months' wages, and the servant is an unsecured creditor for the balance beyond that sum. The death of the master is a discharge of the contract, and in many cases, the servant is not entitled to recover wages for the time actually served, though there is an exception as to domestic servants. If a servant is rightfully discharged, he is not entitled to wages for the broken time since the date of the periodical payment of wages; and so in the case of the servant's death during the current term, the servant's executors cannot recover wages for the broken time; but it is otherwise in the case of domestic servants. When a servant is sick, the master is not bound to provide attendance whether the servant lives in the house or not; but as in such cases a doctor is sent for by the master without any express agreement between the parties, the master is frequently made liable on the ground that the servant was sent for by and gave credit to the master. As a general rule, the servant takes the risk of ordinary accidents attending the particular service, and if he suffer from an accident met with in the course of the service, the master is not liable for the consequences, unless there was some negligence on his part. Thus, it often happens that servants are engaged in a manufactory or where machinery is used and accidents frequently occur. Another case often occurs where three servants of the same master are engaged together, and one servant is injured by the negligence of another. In such a case, the rule is that the injured servant can sue the master where the servants at the time were engaged in a common operation, for in the latter case, the master is or ought to be a check on each of his servants, and in cases where a servant injures a third party, the master is, in fact, liable, provided the servant at the time was acting in the ordinary course of duty, and within the scope of the master's

## MASTER-AT-ARMS—MASTER OF THE HORSE.

ed or implied. Hence, if a coachman care-  
run down a person on the highway, or do  
to another, the master is liable; but if the  
an was driving the master's carriage without  
rary to the orders of the master, the servant  
s liable. So the master is not in any way  
ible for the crimes or criminal offences com-  
by his servant; yet sometimes he is in-  
in fines. The above are the general rules  
ards servants generally; but in England  
s a distinction in many instances observed  
a domestic servants and other servants. The  
distinction is, that if nothing is said as to  
gth of service, it is presumed that the  
can be terminated at any time, on giving a  
notice on either side, or in case of the dis-  
of a domestic servant without notice, then  
ment of a month's wages. It is often popu-  
bought that a domestic servant cannot be  
out of the master's house at a moment's  
even on paying a month's wages, but this can  
be done with or without cause. In case of  
ge without cause, the servant is entitled  
nth's wages, but not board wages; she also  
ges only up to the master's death. He is not  
ed to give a character to the servant; it is  
optional; but if he does so, then it must  
be one, otherwise an action will lie for defa-

But if a master without malice, and acting  
le, gives an untrue character, he is not liable,  
communication is held to be privileged. If  
er knowingly give a false character to a  
who is engaged by a third party on the  
it, and robs such third party, the latter can  
e former master for the damages. Persons  
ting masters, and giving false characters, and  
s using such false characters, are liable to  
marily convicted, and fined £20.

General, a servant, if he refuse to enter the  
or leave it without cause, is merely liable  
action of damages for breach of contract,  
s no remedy at all, as few servants are worth  
sense of a suit. As this conduct, however,  
ften cause great hardship to masters, espe-  
where they are employed in trade or manu-  
s, statutes have been passed which give a  
to justices of the peace to compel the servant  
ain in the service until he give the legal  
to leave. This is done by punishing the  
who leaves the service without just cause  
risonment; and the dread of this punish-  
supposed to act on the servant compulsorily.  
wer is not competent, as already mentioned,  
case of domestic servants, but is so in regard  
skilled workmen and agricultural servants,  
icers, calico-printers, handicraftsmen, miners,  
labourers, &c. The master, on making oath  
a justice, can obtain a warrant to arrest  
ling servants of this description. But this  
of late years been complained of by work-  
one-sided.

Scotland, the law as to master and servant  
from the above in several particulars, of  
the following are the most important. With  
to domestic servants, in towns, if nothing is  
en the hiring is for half a year, and cannot  
an end to without forty days' warning before  
l of the half year; and if the servant is dis-  
without just cause, he or she can claim not  
ges but board-wages till the end of the term.  
of the master's death, the servant can claim  
or the whole of the current term, but is bound  
case to serve the executors, or look out for  
situation. In case of the master's bank-  
the servant is a privileged debtor for the  
f the current term. In most other respects,

the law as to servants is the same as in England.  
And the statutes which enable justices of the peace  
to imprison defaulting workmen and artificers, ex-  
tend to Scotland. See MASTER & SERVANT in Supp.

MASTER-AT-ARMS is a petty officer on board  
a ship-of-war, charged with the care and instruction  
in the use of small-arms, except as regards the  
marines. He is also employed in maintaining disci-  
pline, order, and cleanliness among the crew. His  
assistants in his duties are the 'ship's corporals.'

MASTER OF ARTS (abbreviated M.A., and  
sometimes, particularly in Scotland, A.M.,) is a  
degree conferred by universities or colleges. In the  
universities of England, this title follows that of  
Bachelor (q. v.). It is the highest in the faculty of  
Arts, but subordinate to that of Bachelor of Divinity.  
A Master becomes a Regent shortly after obtaining  
his degree, and thereby obtains the privilege of  
voting in congregation or convocation at Oxford,  
and in the senate at Cambridge; and in the Scotch  
universities, of becoming a member of the General  
Council. See DEGREE.

MASTER OF COURT is the title given in  
England to the chief officers under the judges,  
their duty being to attend the sittings of the  
courts during term, and make minutes of their  
proceedings. They also tax all the bills of costs of  
the parties arising out of the suits and matters  
before the courts. They are appointed by the chief  
judge of the court, and hold their offices for life  
during good-behaviour. Masters in Chancery were  
similar officers in the Court of Chancery, but were  
abolished, and the duties are now performed partly  
by the judge, and partly by the registrars.

MASTER OF THE BUCKHOUNDS, an  
officer in the Master of the Horse's department of  
the royal household, who has the control of all  
matters relating to the royal hunts. A salary of  
£1700 is attached to the office, which is regarded  
as one of considerable political importance. The  
Master of the Buckhounds goes out of office on  
a change of ministry.

MASTER OF THE CEREMONIES, an office  
instituted at the court of England in 1603, for the  
more honourable reception of ambassadors and per-  
sons of distinction. The same term was afterwards  
extended beyond the court, by being applied first  
to Beau Nash, the famous 'Master of the Cere-  
monies,' or president of the amusements at Bath,  
and then to other persons exercising the same  
function in ordinary assemblies.

MASTER OF THE GREAT WARDROBE,  
an officer at the court of England, who had, in  
former times, the superintendence of the royal  
wardrobe. The office existed from a very early  
period down to 1782, and was considered a position  
of great honour. Its duties are now transferred to  
the Lord Chamberlain.

MASTER OF THE HORSE, the third great  
officer of the court, who has the superintendence  
of the royal stables, and of all horses and breeds  
of horses belonging to the Queen. He exercises  
authority over all the equerries and pages, grooms,  
coachmen, saddlers, and farriers, and has the  
appointment and control of all artificers working  
for the Queen's stables. He is answerable for the  
disbursement of all revenues appropriated to defray  
the expenses of his department; but his accounts  
are audited and examined by the Board of Green  
Cloth. He has the privilege of making use of the  
royal horses, pages, and servants, and rides next to  
Her Majesty on all state occasions. The office is  
one of great antiquity, and is considered to be a

## MASTER OF THE HOUSEHOLD—MATARO.

position of great honour. The Master of the Horse is appointed during pleasure, by letters-patent; but his tenure of office depends on the existence of the political party in power. The salary is £2500 a year.

**MASTER OF THE HOUSEHOLD**, an officer in the Lord Steward's department of the royal household, whose specific duties consist in superintending the selection, qualification, and conduct of the household servants. He is under the treasurer, and examines a portion of the accounts. The appointment is during pleasure, and is not dependent on political party. The salary is £1158 per annum.

**MASTER OF THE ROLLS**, the president of the Chancery Division of the High Court of Justice in England, and in rank next to the Lord Chief-Justice of England, and the Lord Chancellor. He was an ancient officer of the court, and was formerly the chief of the Masters in Chancery. He is the only superior judge in England who can now be elected to represent a constituency in the House of Commons. The Master of the Rolls had originally the custody of the Rolls or Records; in the course of time, this charge became merely nominal, the custody having vested in officers not in his appointment or control; an anomaly which was remedied by 1 and 2 Vict. c. 94, which restored the custody to him with extensive powers. The salary is £7000 a year.

**MASTERWORT** (*Peucedanum Ostruthium*), a perennial plant of the natural order *Umbellifera*, having a stem from one foot to two feet high, broad bi-ternate leaves, large flat umbels of whitish flowers, and flat, orbicular, broadly margined fruit. It is a native of the north of Europe and the north of America, and is found in moist pastures in some parts of Britain, but apparently naturalised rather than indigenous, its root having formerly been much cultivated as a potherb, and held in great repute as a stomachic, sudorific, diuretic, &c.; its virtues being reckoned so many and great that it was called *divinum remedium*. It still retains a place in the medical practice of some countries of Europe, although, probably, it is nothing more than an aromatic stimulant. The root has a pungent taste, causes a flow of saliva, and a sensation of warmth in the mouth, and often affords relief in toothache.

**MASTIC**, a species of gum-resin yielded by the Mastic or Lentisk tree (*Pistacia lentiscus*, natural order *Terebinthaceae*). It oozes from cuts made in the bark, and hardens on the stem in small round tear-like lumps of a straw-colour, or if not collected in time, it falls on the ground; in the latter state, it acquires some impurities, and is consequently less valuable. The chief use of this gum-resin is in making the almost colourless varnish for varnishing prints, maps, drawings, &c. It is also used by dentists for stopping hollow teeth, and was formerly used in medicine. It is imported in small quantities, chiefly from the Morocco coast, but some is occasionally brought from the south of Europe.—The name of mastic is also given to oleaginous cements, composed of about 7 parts of litharge and 93 of burned clay, reduced to fine powder, made into a paste with linseed oil.

**MASTIFF**, a kind of dog, of which one variety has been known from ancient times as peculiarly English, and another is found in Tibet. No kind of domestic dog has more appearance of being a distinct species than this, and it shews little inclination to mix with other races, although the English M. has been in part crossed with the stag-hound and blood-hound. The English M. is large and powerful, with a large head, broad

muzzle, large, thick, pendulous lips, hanging ears of moderate size, smooth hair, and a full but not bushy tail. It is generally from 25 to 28 inches high at the shoulder, but a still greater size is sometimes attained. The M. is very courageous, and does not flee even from the lion, for which three or four of these dogs are said to be a match. The Gauls trained British mastiffs, and employed them in their wars. The M. is now chiefly valued as a watch-dog, for which no dog excels it; and whilst it faithfully protects the property intrusted to it, it has the additional merit of refraining from the infliction of personal injury on the invader. It becomes much attached to its master, although not very demonstratively affectionate; it is excelled by many kinds of dog in sagacity. The English M. is usually of some shade of buff colour, with dark muzzle and ears. The ancient English breed was brindled yellow and black.—The M. or TIBET is still larger than the English; the head is more elevated at the back; the skin, from the eyebrow, forms a fold which descends on the hanging lip; the hair is very rough, and the tail bushy; the colour mostly a deep black.

**MASTODON**, a genus of fossil proboscidean pachyderms, nearly allied to the elephant, but with simpler grinding teeth, adapted for bruising coarser vegetable substances, or perhaps fitted for an animal of a more omnivorous character than its modern representative. The teeth were roughly mammillated, hence the name, meaning test-tooth. Eleven or twelve species have been described from the Miocene, Pleiocene, and Pleistocene strata in Europe, Asia, and America.

**MASULIPATAM**, a maritime district of British India, in the presidency of Madras, having the river Kistnah for its south-west boundary. Area, 5000 square miles; pop. 520,866. Along the shore to a distance of 40 or 50 miles inland, the surface is exceedingly low, lower in some places than the shore itself and the beds of the Kistnah and the Godavery, the chief rivers. The commercial crops are chay-root, indigo, tobacco, and cotton. Chief town, MASULIPATAM, on a wide bay, in lat. 16° 12' north. Pop. stated at 25,000, who carry on cotton manufactures to some extent.

**MA'TADOR** (Spanish, 'slayer'). See **BULL-FIGHT**.

**MATAGO'RDA**, seaport and bay, on the Gulf of Mexico, at the mouth of the Colorado River, Texas, United States of America, 80 miles west-south-west of Galveston, an important outlet of a country rich in cotton, sugar, rice, &c. The town was destroyed by a storm in 1854, but has been rebuilt, and contains a population of about 2000.

**MATAMORAS**, a river-port of Mexico, in the department of Tamaulipas, is situated on the south bank of the Rio Grande, 40 miles from the mouth of that river in the Gulf of Mexico. Pop. 20,000. The chief exports are specie, hides, wool, and horses; the chief imports, manufactured goods from Great Britain and the United States.

**MATA'NZAS**, a fortified town and seaport on the north coast of the island of Cuba, 55 miles east of Havana, with which it is connected by railway. It is situated in an exceedingly rich and fertile district, has an excellent, well-sheltered harbour, and a pop. of 36,102. After Havana, it is the most important trading-place on the island.

**MATARO**, a flourishing city and seaport of Spain, in the province of Barcelona, 17½ miles north-east by railway from the city of that name. There are here cotton-spinning mills, several of which are driven by steam, sailcloth factories, tanneries,

## MATCHES—MATE.

several iron-foundries. Pop. 17,500. At the  
ur, there are docks, at which ship-building is  
d on.

**MATCHES**, pieces of various inflammable  
als prepared for the purpose of obtaining fire  
y. One of the first forms of this useful article  
he brimstone match, made by cutting very  
rips of highly resinous or very dry pine-wood,  
six inches long, with pointed ends dipped in  
d sulphur; thus prepared, the sulphur points  
tly ignited when applied to a spark obtained  
iking fire into tinder from a flint and steel.  
was in almost universal use up to the end  
the first quarter of the present century, when  
d ingenious inventions followed each other in  
succession, and displaced it so completely that  
uld be now very difficult to purchase a bunch  
mstone matches. The first of these inventions  
he 'Instantaneous-light Box,' which consisted  
small tin box containing a bottle, in which was  
d some sulphuric acid with sufficient fibrous  
os to soak it up and prevent its spilling out  
e bottle, and a supply of properly prepared  
es. These consisted of small splints of wood  
two inches long, one end of which was coated  
a chemical mixture prepared by mixing chlorate  
dash, six parts; powdered loaf-sugar, two  
; powdered gum-arabic, one part; the whole  
ed with a little vermilion, and made into  
a paste with water. The splints were first  
d into melted sulphur, and afterwards into the  
red paste. They were readily inflamed by  
ag the prepared ends into the sulphuric acid.  
were several disadvantages in this invention,  
ally those arising from the use of so destruc-  
a material as sulphuric acid, which also had  
er drawback: its great power of absorbing  
are soon rendered it inert by the absorption of  
are from the atmosphere. The Lucifer match  
ded the above, and differed materially: the  
of sulphuric acid and all its inconveniences  
dispensed with; the match was either of small  
of pasteboard or wood, and the inflammable  
re was a compound of chlorate of potash and  
uret of antimony, with enough of powdered  
render it adhesive when mixed with water, and  
d over the end of the match, dipped as before  
d brimstone. These matches were ignited  
e friction caused by drawing them through a  
of bent sand-paper. So very popular did  
become, that although they have since passed  
like their predecessors, they have left their  
behind, which is popularly applied to other  
since invented. Next to the Lucifer in im-  
ace was the Congreve, which is the one  
ally used at present. The body of the match  
ally of wood, but some, called Vestas, are of  
thin wax-taper. The composition consists of  
horus and nitre, or phosphorus, sulphur, and  
te of potash, mixed with melted gum or glue,  
coloured with vermilion, red-lead, umber, soot,  
her colouring material. The proportions are  
as varied as the manufacturers are numerous.  
Congreve match requires only a slight friction  
ite it, for which purpose the bottom or some  
part of the box is made rough by attaching a  
of sand-paper, or covering it, after wetting it  
glue, with sand. Amadou, or German tinder,  
ely made into Congreve matches or fuses, as  
are often called, for the use of smokers, to  
their pipes or cigars. The latest introduction,  
he best, is that of Bryant and May, which is  
ly called the 'Special Safety Match.' With  
variety of Lucifer and Congreve, there are  
a dangers attending the use, for in both a  
friction will ignite them, and as, from the

very nature of their application, they are apt to  
be carelessly thrown about, they are consequently  
exposed to the risk of accidental friction, and have  
doubtless been the cause of numerous and serious  
conflagrations. The Congreves are exposed to further  
risks of accidental ignition arising from the employ-  
ment of phosphorus, which, from its very inflam-  
mable nature, will ignite spontaneously if the tem-  
perature is a little higher than ordinary. The  
match of Messrs Bryant and May, although a new  
introduction, was invented in Sweden, under the  
name of the Swedish Safety Match, by a Swede  
named Lundstrom, a large manufacturer of matches  
at Jönköping, in 1855 or 1856, and patented in this  
country by the firm above mentioned. The only  
essential difference from the Congreves is in leaving  
out the phosphorus from the composition applied  
to the match, and instead, mixing it with the  
sand on the friction-surface, thus separating this  
highly inflammable material from its intimate and  
dangerous connection with the sulphur and chlorate  
of potash. This simple invention seems to have  
removed all the objections from the use of this class  
of matches.

Many ingenious inventions have been introduced  
for making the wooden splints. The square ones,  
which have always proved to be the best, are cut  
very simply by two sets of knives acting trans-  
versely to each other. The round ones, which always  
have the fault of weakness, are cut by a perforated  
steel plate invented in 1842 by Mr Partridge. The  
perforations are the same size as the splints; and  
their edges are sufficiently sharp, when pressed on  
the transverse section of the wood, to cut down  
through it. The various ornamental forms of the  
German match-makers, who excel in this manu-  
facture, are produced by planes, the irons of which  
are so constructed as to plough up splints of the  
form required. These are usually made of a soft  
kind of pine-wood—that of *Abies pectinata* is pre-  
ferred in Austria and Germany—of which vast  
quantities are yielded by the forests of Upper  
Austria. Until the introduction of amorphous  
phosphorus (see PHOSPHORUS), the trade of match-  
making was fearfully unhealthy; the emanation of  
phosphoric acid, when common phosphorus was  
used, gave rise to necrosis, or mortification of the  
bones, and fatal effects often followed. Too many  
manufacturers are still using the common kind  
for cheapness, but others avoid the injury to their  
work-people by employing the amorphous kind.  
This, and other dangerous manufactures, demand  
legislative interference.

The trade in matches has assumed enormous  
dimensions, especially in Germany, where vast quan-  
tities are exported. One firm, having its principal  
establishment at Schüttenhofen in Bohemia, employs  
2700 persons in this manufacture; more than one  
firm in England produces ten million Congreve  
matches per day; and a Birmingham firm manu-  
factures daily eight miles of thin wax-taper, and  
converts it into Congreve matches. Indeed, so  
wonderfully has match-making developed itself,  
that in this country more thousands are now  
engaged in it than there were hundreds of persons  
who found employment in making the brimstone  
matches formerly.

**MATCHLOCK.** See **LOCK.**

**MATE** (allied to *meet*, measured, suitable, con-  
formable, equal, companionable) is an assistant, a  
deputy, or a second in any work; in this sense, it  
is a common word in nautical affairs. In the navy,  
its use is now confined to petty officers, such as  
boatswain's-mate, gunner's-mate, &c.; but formerly,  
several officers bore the title, as master's-mate,

## MATÉ—MATERIALISM.

now second master, surgeon's-mate, now assistant-surgeon. Until within a few years, the distinctive term *mate* survived, and was applied to a grade between lieutenant and midshipman: the title is now changed to *Sub-lieutenant* (q. v.).

In the merchant-service, the mates are important officers, holding functions not greatly inferior to those of lieutenants in the royal navy. The first mate ranks next to the master or captain, commands in his absence, and is immediately responsible for the state of the vessel; the second and third (and fourth in large well-found vessels) have various analogous duties, the junior mate generally having the superintendence of the stowage of the cargo.

MATÉ, or PARAGUAY TEA, a substitute for tea, extensively used in South America, and almost universally through Brazil. It consists of the leaves and green shoots of certain species of Holly (q. v.), more especially *Ilex Paraguayensis*, dried and roughly ground; the leafy portion being reduced to a coarse powder, and the twigs being in a more or less broken state, sometimes, however, as much as an inch in length. The term *maté*, which has by usage attached to this material, belonged originally to the vessels in which it was infused for drinking; these were usually made of gourds or calabashes, often trained into curious forms during their growth. Into the hollow vessels thus formed, a small quantity of the material, more properly called *Yerba de Maté*, is put, and boiling water is added; it is then handed round to those who are to partake of it; and each being provided with a small tube about eight inches in length, with a small bulb at one end, made either of basket-work of wonderful fineness, or of perforated metal, to act as a strainer, and prevent the fine particles from being drawn up into the mouth, dips in this instrument, which is called a *bombilla*, and sucks up a small portion of the infusion, and passes the *maté*-bowl on to the next person. It is usual to drink it exceedingly hot, so much so as to be extremely unpleasant to Europeans. Its effect is much the same as tea, stimulating and restorative; and it derives this property from the presence of a large proportion of the same principle which is found in tea and coffee—viz., *Theine*. The collection and preparation of *maté* is a large industrial occupation in Paraguay and Brazil; and the learned and accurate botanist, Mr John Miers, has proved that not only *Ilex Paraguayensis*, but also *I. curitibensis*, *I. gigantea*, *I. ovalifolia*, *I. Humboldtiana*, and *I. nigropunctata*, besides several varieties of these species are in general use. It is very remarkable that when caffeic acid, to which coffee owes its agreeable flavour, independently of the theine, is treated with sulphuric acid and binoxide of manganese, it forms kinone; and by treating the *maté* with the same agents, kinone has also been obtained.

Upwards of 5,000,000 lbs. of M. are annually exported from Paraguay to other parts of South America; but it is not yet an article of export to other quarters of the world.

*Ilex Paraguayensis* is a large shrub or small tree; with smooth, wedge-shaped, remotely serrated leaves, and umbels of small flowers in the axils of the leaves. The leaves of many species of holly possess properties very different from those of the M. trees. Some are emetic.

MATERA, a city of the Italian province Basilicata, situated between lovely valleys, 37 miles west-north-west of Taranto. Pop. 14,225. It has an episcopal palace, a cathedral, and a college, but its lower classes are reputed the most uncivilised

of Southern Italy; they dwell chiefly in ancient caverns, excavated in the side of the deep valley surrounding the town, and are much afflicted with cretinism. M. has manufactures of leather and arms, and a trade in nitre and agricultural produce.

MATERIA MEDICA is that department of the science of medicine which treats of the materials employed for the alleviation and cure of disease. Some writers, as Pereira, divide the subject into the inorganic and the organic, while others, as Christison, adopt an alphabetical arrangement. In the description of an inorganic compound, as, for example, iodide of potassium or calomel, the writer on *materia medica* notices (1), its physical properties; (2), its various modes of preparation; (3), its chemical composition and relations, including the tests for its purity, and the means of detecting its probable adulterations; (4), its physiological action on man and animals in large and small doses; (5), its therapeutic actions and uses, and the average doses in which it should be prescribed; and (6), the official preparations containing the substance in question, and their uses and doses: while in the notice of an article belonging to the organic department, the natural history of the source from whence it is obtained, and the mode of collecting or extracting it, must also be given.

MATERIALISM. This is the name for a certain mode of viewing the nature of mind, namely, to regard it either as mere matter, or as a product of the material organisation. The opposite view is called Spiritualism, and means that the mind, although united with the body, is not essentially dependent on bodily organs, but may have an existence apart from these. There has been much controversy on this question; and although in later times the immateriality of the mind has been the favourite view, and been treated by many as a supposition essential to the doctrine of man's immortality; yet, in the earliest ages of the Christian Church, the materialistic view was considered the most in unison with revelation, and was upheld against the excessive spiritualising tendencies of the Platonic schools. Tertullian contended that the Scriptures prove, in opposition to Plato, that the soul has a beginning, and is corporeal. He ascribes to it a peculiar character or constitution, and even boundary, length, breadth, height, and figure. (This last view is incompatible with the definition of mind. See MIND.) To him, incorporeity was another name for nonentity ( *nihil est incorporeale, nihil quod non est*); and he extended the same principle to the Deity, who, he conceived, must have a body. He could not comprehend either the action of outward things on the mind, or the power of the mind to originate movements in outward things, unless it were corporeal.

The state of our knowledge at the present time shews us more and more the intimacy of the alliance between our mental functions and our bodily organisation. It would appear that feeling, will, and thought are in all cases accompanied with physical changes; no valid exception to this rule has ever been established. Mind, as known to us, therefore, must be considered as reposing upon a series of material organs, although it be totally unlike, and in fundamental contrast to, any of those properties or functions that we usually term material—extension, inertia, colour, &c. We never can resolve mind into matter; that would be a confounding of the greatest contrast that exists in the entire compass of our knowledge (see MIND); but we are driven to admit, from the whole tenor of modern investigation, that the two are inseparably united within the sphere of the animal kingdom. 'Our consciousness

## MATHEMATICAL INSTRUMENTS—MATHEW.

in this life is an embodied consciousness. Human Understanding and Belief are related, in a variety of ways, to the original and successive states of the bodily organism from birth to death. Observation and experiment prove the important practical fact, that the conscious life on earth of every individual is dependent on his organism and its history' (Professor Fraser, *Rational Philosophy in History and in System*, p. 122).

**MATHEMATICAL INSTRUMENTS** include all those instruments employed in the determination of the length of lines or the size of angles. Pairs of compasses, surveying-chains, &c., are examples of the former class; while the compass, sextant, theodolite, and the numerous list of astronomical instruments generally denominated telescopes, including the equatorial, transit instrument, mural circle, &c. from the latter class. The more important of these instruments will be treated of under separate heads.

**MATHEMATICIANS** (Lat. *mathematici*), the name given by the Romans to the professors of astrology, from the fact that, in all cases, those who practised astrology also to some extent cultivated mathematical science. The Romans, unlike the Greeks, appeared not to comprehend the attractions possessed by mathematical studies, and being consequently unable to distinguish between the student of pure science and the fanatic enthusiast who attempted to derive a knowledge of future events on this earth from the position of the stars, joined them together in a common condemnation, under the name of 'mathematici.'

**MATHEMATICS** (Gr. *mathema*, learning), the science which has for its subject-matter the properties of magnitude and number. It is usually divided into *pure* and *mixed*; the first including all deductions from the abstract, self-evident relations of magnitude and number; the second, the results arrived at by applying the principles so established to certain relations found by observation to exist among the phenomena of nature. The branches of pure mathematics which were first developed were, naturally, *Arithmetic*, or the science of number, and *Geometry*, or the science of quantity (in extension). The latter of these was the only branch of mathematics cultivated by the Greeks, their cumbrous notation opposing a barrier to any effective progress in the former science. Algebra (q.v.), or the science of numbers in its most general form, is of much later growth, and was at first merely a kind of universal arithmetic, general symbols taking the place of numbers; but its extraordinary development within the last two centuries has established for it a right to be considered as a distinct science, the *science of operations*. Combinations of these three have given rise to *Trigonometry* (q.v.) and *Analytical Geometry*. The Differential and Integral Calculus (q.v.) makes use of the operations or processes of geometry, algebra, and analysis indifferently; the *calculus of finite differences* is in part included under algebra, and may be considered as an extension of that science; and the *calculus of variations* is based upon the differential calculus. The term 'mixed mathematics' is calculated to lead to error; 'applied mathematics' is a more appropriate name. This portion of mathematics includes all those sciences in which a few simple axioms are mathematically shewn to be sufficient for the deduction of the most important natural phenomena. This definition includes those sciences which treat of pressure, motion, light, heat, sound, electricity and magnetism—usually called *Physics*—and excludes chemistry, geology, political economy, and the other branches of science, which, however, receive more or less aid from mathe-

matics. For a notice of the separate sciences, see ASTRONOMY, OPTICS, MECHANICS, HYDROSTATICS, HYDRODYNAMICS, HEAT, ACOUSTICS, ELECTRICITY, MAGNETISM, &c.

**MATHER, INCREASE**, an American colonial divine, son of Richard Mather, an English nonconformist minister, who emigrated to Massachusetts in 1635, was born at Dorchester, Massachusetts, January 21, 1639. He was educated at Harvard College, Massachusetts, and Trinity College, Dublin, and settled for 62 years as pastor of the North Church, Boston. In 1684, he was also chosen president of Harvard College, for which he obtained the right to confer the degrees of B.D. and D.D. An industrious student, he spent 16 hours a day in his study, and published 92 separate works, most of which are now very scarce. One of these, entitled *Remarkable Providences*, was republished in the Library of Old Authors (London, 1856). His influence was so great in the colony, that he was sent to England in 1688 to secure a new charter, and had the appointment of all the officers under it. M. died at Boston, August 23, 1723.

**MATHER, CORRON**, an American colonial divine, son of the above, was born at Boston, February 12, 1663. He entered Harvard College when 12 years old, and his precocity and piety excited great expectations. He entered upon a course of fasting and vigils, cured a habit of stammering by speaking with 'dilated deliberation,' studied theology, became the colleague of his father in the ministry, and wrote in favour of the political ascendancy of the clergy. The phenomenon termed 'Salem Witchcraft' having appeared in the colony, he investigated it, and wrote, in 1685, his *Memorable Providences relating to Witchcraft and Possessions*. He found that devils or possessed persons were familiar with dead and foreign languages, &c., and eagerly advocated the adoption of desperate remedies for the diabolical disease. It is well known that M. was responsible for the shedding of much innocent blood; and he himself admitted that 'he had gone too far.' In 1692, he published *Wonders of the Invisible World*, to which a reply appeared at London in 1700 by Robert Calet—the effect of which was to dissipate the sombre and superstitious influence of the New England divine. With a remarkable industry, he wrote 382 works. His *Essays to do Good* have been highly commended by Franklin; and when we think of his misdeeds, which were serious, it ought also to be remembered that he helped to introduce into the States inoculation for the smallpox. He died February 13, 1728. His life was written by his son, Samuel Mather (1729).

**MATHEW, REV. THEOBALD**, commonly known as FATHER MATHEW, was descended from an illegitimate branch of the Llandaff family, and was born at Thomastown in Tipperary, Ireland, October 10, 1790. On the death of his father, while M. was still very young, the kindness of the Llandaff family enabled the boy to enter the Catholic college of Kilkenny, whence he was transferred, as a candidate for the Roman Catholic priesthood, to the college of Maynooth, in 1807. He left that college, however, in the next year. He relinquished the secular priesthood for that of the religious order of the Capuchins, in which he took priest's orders in 1814, and was sent to the church of his order in the city of Cork. His singularly charitable and benevolent disposition, his gentleness and affability, his simple and effective eloquence, and the zeal and assiduity with which he discharged all the duties of his ministry, won for him the universal love and respect alike of rich and of poor. To him was due the introduction of the religious brotherhood of

St Vincent of Paul. He founded schools for children of both sexes, and contributed, in a very marked degree, to the correction of many abuses and indecencies connected with the burial of the dead, by establishing a new cemetery on the model of that of Père la Chaise, although, of course, of a far less pretentious character. But the great work of Father M.'s life is the marvellous reformation which he effected in the habits of his fellow-countrymen, and which has won for him the title of APOSTLE OF TEMPERANCE. In 1838, he established an association on the principle of total abstinence, at first confined to the city of Cork, but afterwards numbering 150,000 members in the city alone, and extending to the county and the adjacent districts of Limerick and Kerry. The marvellous success which attended this first local effort, led to the suggestion that Father M. himself should repair to the several great centres of population, especially in the South. Thence he gradually extended the field of his labours to Dublin, to the North, and even to Liverpool, Manchester, London, Glasgow, and the other chief seats of the Irish population, even in the New World itself. His success had something almost of the marvellous in its character. The form of engagement partook of the religious, and was accompanied by the presentation of a medal, to which the utmost reverence was attached by the recipient; and an opinion prevailed among the poor, that the mission of the 'Apostle of Temperance' was marked by many miraculous manifestations of the assistance of Heaven. It is difficult to form an exact estimate of the number of his association; but it included a large proportion of the adult population of Ireland, without distinction of rank, creed, or sex; and so complete was the revolution in the habits of the Irish people, that very many distilleries and breweries ceased from working. Among the sufferers from this great moral revolution, the members of Father M.'s own family, who were largely engaged in the distilling trade, were some of the earliest and most severely visited; and it is painful to have to add, that the latter years of this great benefactor of his country were embittered by pecuniary embarrassments arising out of the engagements into which he entered in the course of his philanthropic labours. Although very large sums of money passed through his hands, in payment for the medals which were distributed to the members of the association, yet the exceeding munificence of his charities, and the enormous expenses connected with his various missions, and perhaps his own improvident and unworldly habits, involved him in painful difficulties. A pension of £300 was granted to him by the crown, in acknowledgment of his eminent public services, and a private subscription was also entered into for the purpose of releasing him from embarrassment. He died in 1856; but the fruit of his labours is still visible in Ireland. Very many, it is true, of those who were enrolled in his association ceased after some years to observe the pledge of total abstinence; but very many also continued faithful; and while but few of those who abandoned the society relapsed into the extreme of drunkenness, the general tone of the public mind in Ireland, as regards the use of intoxicating drinks, may be truly said to have undergone a complete revolution, which endures to the present day.

MATHEWS, CHARLES, an English comedian, was born on the 28th June 1776, and was educated in London. His father was a bookseller, and intended his son to follow the same profession; but his early inclination for the stage overcame parental counsel, and he made his first appearance as an amateur—curiously enough, in the part of Richard III.—at the Richmond Theatre in 1793,

and as a professional comedian in the Theatre Royal, Dublin, the following year. He first appeared in London at the Haymarket, and subsequently he transferred his services to Drury Lane. In 1818, he gave his 'At Home' in London, and achieved an immense success. He visited America twice. In the autumn of 1828, he became joint-proprietor of the Adelphi Theatre. He died at Plymouth on the 28th June 1835, and was buried in that town.

M. was a wonderful master of personification and mimicry; and while imitating every one, he never lost a friend, or hurt the feelings of the most sensitive. His taste was as instinctive as his wit. His wonderful variety of facial expression, and his gentlemanly sarcasm, are still fondly remembered by old playgoers. His son CHARLES, born in the early part of the present century, has also achieved a brilliant reputation in the same department of histrionic art.

MATHIAS CORVINUS, king of Hungary, was the second son of John Hunyady (q. v.), and was born in 1443. Having been released from the hands of the treacherous Frederick III. of Germany by Podiebrad, king of Bohemia, he returned to Hungary, and was elected king in 1446. His accession was hailed with the utmost enthusiasm over the whole country. But the Hungarian crown at this time was no chaplet of roses; two sovereigns, alike formidable, the one, Mohammed II., from his military talents and immense resources, the other, Frederic III., from his intriguing policy, were busily conspiring against the boy-king. To meet these dangers, M. rapidly carried out his measures of defence, the most important of which was the formation of a regular force of cavalry, to form which, one man was enrolled out of every twenty families. This was the origin of the term 'Hunaz', which means in Hungarian 'the price or due of twenty.' M. fell on the Turks, who had ravaged the country as far as Temesvar, inflicted upon them a bloody defeat, pursued them as far as Bosnia, took the stronghold Jaieza, where he liberated 10,000 Christian prisoners, and thence returned to Weissenberg, where he was crowned with the sacred cross of St Stephen in 1464. He next suppressed the disorders of Wallachia and Moldavia; but feeling that his plans were counteracted by the intrigues of Frederick III. to gain possession of Hungary, M. besought the assistance of Pope Pius II., but to no purpose. After a second successful campaign against the Turks, he turned his attention to the encouragement of arts and letters, and adorned his capital with the works of renowned sculptors, in addition to a library of 50,000 volumes. He sent a large staff of literary men to Italy for the purpose of obtaining copies of valuable manuscripts,\* and adorned his court by the presence of the most eminent men of Italy and Germany. He was himself an author of no mean ability, and he possessed a delicate appreciation of the fine arts. At the same time, the affairs of government were not neglected. The finances were brought into a flourishing condition, industry and commerce were promoted by wise legislation, and justice was strictly administered to peasant and noble alike. But the promptings of his ambition, and the pressure exercised by the Catholic party, cast an indelible blot on M.'s otherwise spotless escutcheon; he wantonly attacked Podiebrad, his father-in-law, the Hussite king of Bohemia, and after a bloody contest of seven years' duration between these kings, the greatest generals of the age, the Hungarian power prevailed, and Moravia, Silesia, and Lusatia were wrested from

\* Even at the present day, the remains of the celebrated *Collectio Corvina* are eagerly sought after.

hemia. Immediately after the conclusion of this war, M. went to meet his old enemies, the Turks, and inflicted upon them, at Kenyérmező (1479), such defeat as kept them quiet for the next 46 years. After defeating an invading army of Poles, he had length a fair opportunity for settling his differences with Frederick, and taking revenge on the seditious plotter who had embittered his whole life. The Austrian fortresses fell before him in rapid succession. After an obstinate defence, Vienna shared the same fate (1485), and the emperor was reduced to beg his bread from village to village. M. now took up his residence in Vienna, but while on the anvil of glory, he was struck down by a fit of apoplexy, and died at Vienna in 1490. To the patriotism and bravery of his father, M. added a taste for letters, and the highest abilities as an administrator and politician; even his secret enemy, Stelli, testifies 'that for subtlety and daring he had no equal among the princes of the age.'

**MATHILDA**, Countess of Tuscany, well known in history through her close political connection with Pope Gregory VII., was a daughter of Boniface, Count of Tuscany, and was born in 1046. She is said to have married Godfrey (surnamed *Il Gobbo*, the 'Hunchback'), Duke of Lorraine, in 1069, by coercion; but if so, her husband did not make an appearance in Italy until four years after the wedding-ceremony, and the two, if they were ever united, soon afterwards separated. Godfrey went back to his duchy, and became a supporter of the Emperor Henry IV., while M. made herself conspicuous by the zeal with which she espoused the cause of Gregory VII. She became his inseparable associate, was ever ready to assist him in all he undertook, and to share every danger from which he could not protect him. In 1077 or 1079, she made a gift of all her goods and possessions to the church. In 1081, she alone stood by the pope, when Henry poured his troops into Italy, burning to avenge his humiliation at Canossa; she supported him with money when he was besieged in Rome; and after his death at Salerno, boldly carried on the war against the emperor. She died at the Benedictine monastery of Polirone in 1115. M.'s death gave rise to new feuds between the emperor and Pope Paschal III., on account of her gift to the church, which finally resulted in the former wresting from the latter a portion of M.'s possessions, but in what remained constituted nearly the whole of the subsequent 'Patrimony of Peter.'

**MATHURA**. See **MUTTRA**, in SUPPLEMENT.

**MATICO** (*Artanthe elongata*), a shrub of the natural order *Piperaceæ*, a native of Peru, remarkable for the styptic property of its leaves, which are used for stanching wounds, and are also useful as an aromatic stimulant in mucous discharges of various kinds.

**MATINS**. See **CANONICAL HOURS**.

**MATRICA'RIA**. See **CHAMOMILE**.

**MATTER**. From a physical point of view, matter is anything that can affect the senses, or that can exert, or be acted on by, force. The existence of matter, in the sense of *substance*, has been doubted by many philosophers, including some of the greatest experimenters. Indeed, as we can know matter only by the forces it exerts, it is obvious that the supposition of mere geometric points, capable of exerting force (technically called *Centres of Force*), does not satisfactorily account for all observed phenomena as any other idea of the ultimate nature of matter. Here, however, we are dealing with a notion confessedly beyond the reach of experiment, and belonging to the domain with which metaphysics professes to deal. See **PERCEPTION**.

Although experiment cannot lead to a knowledge of the ultimate nature of matter, it may lead to important discoveries as to the arrangement of the molecules of different bodies, and their similarity or dissimilarity. Some of the questions to which we may expect an answer, though not a speedy one, have already been mentioned in the article **FORCE**, **CONSERVATION OF**; but in order to render intelligible the short account which we intend to give of some very interesting ideas recently propounded by Graham (q. v.), it will be necessary to repeat some of them.

The old idea of the transmutation of metals (see **ALCHEMY**) implicitly contains the assumption that all kinds of matter are ultimately one. Far from being a startling assumption, this is the simplest and most easily conceived notion we can entertain on the subject; and it offers a remarkably simple explanation of that extraordinary property of matter which Newton proved by careful experiments, that the weight of a body depends only on the quantity, not on the quality of the matter that composes it. One idea, then, of matter is, that the atoms (or smallest parts, whatever these may be) of all bodies are identical, but that the molecules (each of which is a single atom, or a definitely arranged group of atoms) differ from one body to another. Thus (to take an instance merely for *explanation*, not as at all likely to be correct), if hydrogen be supposed to consist of the simple atoms of matter; oxygen, each molecule of which is eight times as heavy as one of hydrogen, may have each molecule formed of eight elementary atoms, arranged in a group such as the corners of a die; carbon, six times as heavy per molecule, might be composed of six simple atoms grouped as at the corners of an octohedron; and so on. It is obvious that here each atom must be supposed capable of exerting force on every other. This leads us naturally to speculations as to the medium through which this force, if it be exerted at a distance, is propagated (see **FORCE**, **CONSERVATION OF**); and then we have introduced matter of a more refined character than our supposed elementary atoms. This difficulty has suggested to various philosophers the idea, that there is no *actio in distans*, that all pressure, for instance, in a gas is due to incessant impacts of its particles upon each other and upon the containing vessel. But from various experimental results, we know that this species of motion is capable of being transferred from one body to another, of being increased or diminished by change of temperature, and is, in fact, *Heat* itself, one form of kinetic energy. This, if there be no ultimate difference between kinds of matter, could never be the cause of their apparent difference. Hence, in Graham's view, though all ultimate atoms are identical in substance, they have special motions of their own, by which one is distinguished from another, these motions not being capable of transfer from one atom or group of atoms to another. It is difficult to conceive energy in such a form as not to be transferable, so that we refer the reader to Graham's own papers for the further development of his theory—marking, in conclusion, that no theory of the nature of matter can be considered as at all complete till it account for the mutual action of separate atoms; for this the existence of a *continuous* material medium in space would seem to be necessary; and this, in its turn, would, if accepted, enable us to dispense with the idea of atoms. In connection with this, we may mention that W. Thomson has recently shewn that mere heterogeneity (which we know exists in matter), together with gravitation, is sufficient to explain all the apparently discordant laws of molecular action; matter being supposed, in

this theory, to be continuous but of varying density from point to point.

**MATTHEW, SAINT**, an apostle and evangelist, was a publican or tax-gatherer at the Sea of Galilee. It is assumed by divines generally, that he is the same person that Mark and Luke refer to under the name of 'Levi'; but several weighty names are against this view, as, for example, Origen, Grotius, Michaelis, and Ewald. After the ascension of Christ, M. is found at Jerusalem; he then disappears from Scripture. Nothing whatever is known of his career.—M.'s GOSPEL is believed to be the first in point of time. Irenæus places its composition in the year 61 A.D.; some of the later Fathers, as early as 41 A.D. The obvious design of the work is to prove the Messiahship of Jesus; hence the frequency of the expression used in regard to the acts of the Saviour, 'that it might be fulfilled which was spoken by the prophet.' Much controversy has been carried on regarding the language in which St M. wrote his gospel. The opinion of the ancient church generally (founded on a passage in Papias, Bishop of Hierapolis in the 2d century) was, that M. wrote it in Hebrew, or rather in that mixture of Hebrew, Chaldee, and Syriac spoken in Palestine in Christ's time, and known as Aramaic. Erasmus doubted this, and held that M. only wrote the one we now possess. His view was supported by Calvin, Beza, and others of the reformers; and more recently, in some form or other, by the great majority of scholars, both orthodox and heterodox. Still more recently, the opinion of Bengel, that M. wrote first a Hebrew gospel, and then translated it into Greek, has been advocated by several able writers. The passage in Papias is by no means clear; and some of the greatest grammarians and biblicists, such as Lachmann, Ewald, Meyer, Reuss, and Credner, understand it to mean that M. only drew up a series of notices of Christ's life and sermons, which were afterwards arranged in some sort of order by another writer. Even yet, however, the order is but dimly perceptible, and little or no attention is paid to chronological sequence. On this view, the present gospel is M.'s in substance only, and not in form. The style is comparatively tame, and even the conception of Christ which is predominant is earthly rather than divine. Hence, the Fathers called it the *Somatic* or 'bodily' gospel, as distinguished from the more spiritual gospels of Luke and John.

**MATTHEW OF WESTMINSTER**, an early English chronicler, who flourished in the reign of Edward II., but of whom nothing whatever is known, except that he was a monk of the Benedictine Abbey of Westminster. His history or chronicle is written in Latin, and is entitled *Flores Historiarum, per Matthæum Wesmonasteriensem collecti, præcipue de Rebus Britannicis, ab Exordio Mundi, usque ad annum 1307* (Flowers of History gathered by Matthew of Westminster, chiefly concerning the affairs of Britain, from the Beginning of the World down to the year 1307). That part which treats of English history from the Conquest to the close of Edward I.'s reign is considered valuable, on account of the manifest diligence, accuracy, and honesty of the writer. The work was first printed at London in 1567, and again (with additions) at Frankfurt in 1601. Bohn has published a translation into English (2 vols. 1853).

**MATTO** or **MATO GROSSO** (*dense forest*), a province of Brazil, bordering on Bolivia. Area, 406,500 square miles; population estimated at 100,000, mostly Indians. Chief rivers, the Madeira, Juruema, and Paraguary, with their numerous

affluents. Its soil is fertile, but there is almost no cultivation. Dense forests cover immense tracts of the country. Gold and diamonds abound, indeed the mineral riches of the province, hitherto formed the chief barrier to its progress. Diamonds and gold, with a quantity of ipecacuanha, are the whole exports. Manufactured goods are imported.

**MAUCHLINE**, a town in the county of Ayr, Scotland, is pleasantly situated, and is surrounded by a picturesque country. M. has long been famous for the making of a beautiful description of boxes, cigar-cases, and other articles of that class of manufacture. The buildings of the town are neat, and possess a pleasing variety. St. Andrew's Church, as M. does, on the river Ayr, the bridges of which neighbourhood attract attention, one of which, Barskimming, is a structure of considerable elegance, consisting of a single arch 100 feet wide, and 40 feet high. In the vicinity is Mauchline Castle, formerly possessed by the Loudon family, who have a right to the title Viscount Mauchline; the castle is also the green on which a stone commemorates the death of five Covenanters in 1685. Robert Burns spent nine years of his life at the farm of Mauchline, about half a mile to the north of M. The cottages are called 'Poosie Nancy,' theatre of the 'Jolly Beggar,' Mauchline Kirk, the scene of the 'Holy Fair' in the town. The population in 1871 was 157.

**MAUL**. See SANDWICH ISLANDS.

**MAULMAIN**. See MOULMEIN.

**MAUNDY-THURSDAY**, the Thursday before Good Friday, or Holy Week (q.v.). The name is derived from *maund*, the first word of the service chanted at the washing of the feet of pilgrims on that day, which is taken from John xiii. 34. The washing of the feet of pilgrims is of very ancient usage, being referred to by St Augustine; and, both in ancient and modern times, it was accompanied by a distribution of 'maunds,' which were handed to the pilgrims in small leather bags, thence called 'maunds.' In the royal usage, a maund in England, the number of doles distributed was reckoned by the years of the monarch. The ceremony is usually given by the Lord High Almoner. James II. performed the ceremony in person. The distribution of doles was retained till the year 1700, since which period the 'Maundy' men and women receive a money-payment from the Clerk of the Almonry Office, instead of the dole. In most European countries, the maund was held in all the houses; and in England, in the Household of the Earl of Northumberland, which begins in the 14th century, there are entries of 'al manner of things yerly by my lord of his Maundy and my ladys and lordshipis children.'

**MAUPERTUIS, PIERRE LOUIS MOREAU**, French mathematician, was born at St. M. in 1698. He early displayed a love of mathematics, and after serving in the army for five years, drew from it to pursue his favourite studies. His able advocacy of Newton's physical theory, in opposition to that of Descartes, gained him great favour in Britain, and he was admitted to the Royal Society of London in 1727. In 1736, he was placed at the head of the Académiciens. Louis XV. sent him to Lapland, to obtain the measurement of a degree of longitude, while the same thing was also being done in Peru by Bouguer. This operation he described in his work *la Figure de la Terre, déterminée par les Observations de M. Clairaut, Camus, &c.* (Paris, 1738). In 1740, he went to Berlin, on the invitation of Frederick II. to be President of the Academy there; but he was accompanied by the Prussian army to the field, and taken prisoner at Mollwitz by the Austrians.

## MAURICE—MAURITANIA.

it to Vienna in 1741. He returned to Berlin afterwards, and resumed his former office; but his *amour-propre* and tyrannical disposition gained him general dislike. Among others, M. attacked Voltaire; but the latter applied the lash of satire so successfully, that M. was perforce compelled to return to France in 1756. In 1758, he went to Basel, for the sake of his health, and to enjoy the society of the *salon*, but died soon after, 27th July 1759. M. was a mathematician of ordinary ability, but a superior philosopher, and owed his celebrity to the idiosyncrasies of his manners and disposition to his merit.

**MAURICE, PRINCE OF ORANGE and COUNT OF** Nassau, one of the most skilful and distinguished of his age, was the son of William I., Prince of Orange, and was born at Dillenburg, 14th Dec. 1567. After his father's assassination in the provinces of Holland and Zealand, and at Utrecht, elected him their stadtholder. A portion of the Netherlands was still in the hands of the Spaniards; but under the leadership of M., the Dutch rapidly wrested the fortresses from their enemies. In 1591, at Deventer, Nimeguen, and other places fell into his hands; in 1593, Gertruydenberg; and in 1597, Groningen. In 1597, with the help of English auxiliaries, he defeated the Spaniards at the battle of Nieuport, and in 1600 won a splendid victory at Nieuport. Finally, in 1609, Spain was obliged to acknowledge the United Provinces as a free republic. The ambition of M., however, was not to the desire of sovereignty; but in this, standing the love and respect with which he was regarded by the people, he finally failed. See **DE WIT**. He died at the Hague, 23d April 1625.

**MAURICE, REV. FREDERICK DENISON, D.D.**, distinguished divine of the Church of England, one of the most influential thinkers of his age, son of a Unitarian minister, and was born at Cambridge. His reputation at the university for his ship stood high, but being at this time a clergyman, and otherwise not in a position to sign the Thirty-nine Articles, he left Cambridge without a degree, and commenced a literary career in London. To this period belongs his novel entitled *Conyngers*. He also wrote for the *Athenæum*, had then been recently started by James Mackintosh. After the lapse of two years, he came over his religious sentiments and his spirit was profoundly stirred and agitated by the speculations of Coleridge, and he resolved to become a clergyman of the Church of England. He did not, however, return to Cambridge, but proceeded to Oxford, where he took the degree of M.A., and was ordained a priest about 1810. From that time, the aim of his whole life was the interpretation of Christianity in accordance with the most pure and spiritual conceptions of our religion; nor have his labours been without result. At the time of his death, there was probably no man in the United Kingdom more deeply respected and loved than he was by a large body of thoughtful and cultivated portion of the religiosity. He also succeeded in gathering round him in the church, a large number of adherents, especially among the younger clergy, who constitute what is commonly called the 'Broad Church,' though its members repudiate any sectionalism, and do not associate for the purpose of setting out any sectional schemes, like the 'Evangelical' and Tractarians. M.'s theological opinions, especially on the question of the atonement, are not regarded as 'sound' by the 'orthodox' portion of the

clergy; and the publication of a volume of *Theological Essays*, in which, among other heresies, he took the charitable view of future punishments, lost him the Professorship of Theology in King's College, London. For many years, M. was chaplain of Lincoln's Inn, but in 1860 he was appointed incumbent of the district church of Vere Street, Mary-le-bone. He was always a warm and enlightened friend of the working-classes, and founded the first Working-man's College in London. M. became professor of moral philosophy at Cambridge in 1866, and died April 1, 1872. He wrote largely. All his works are written in the most exquisite English, and display a beauty and tenderness of Christian sentiment that are nearly faultless, but united with a subtlety of thought that frequently passes into mysticism. His principal productions are his *Mental and Moral Philosophy*, *Religions of the World*, *Prophets and Kings of the Old Testament*, *Patriarchs and Lawgivers of the Old Testament*, *The Kingdom of Christ*, *The Doctrine of Sacrifice*, *Theological Essays*, *Lectures on the Ecclesiastical History of the First and Second Centuries*, *Gospel of St John*, and *Social Morality*.

**MAURICIUS**, one of the greatest of the Byzantine emperors, was descended of an ancient Roman family, and was born at Arabissus, in Cappadocia, about 539 A.D., and executed November 27, 602. During the reigns of Justin II. and Tiberius, M. served in the army, and in 578 was appointed by the latter emperor to the command of the army against the Persians, in which office he gained the universal esteem of his soldiers, notwithstanding the severity of his discipline, and surpassed the emperor's hopes by humbling to the earth the most dangerous enemy of the eastern empire. In 582, he obtained the rare honour of a triumph at Constantinople, and in August of the same year succeeded Tiberius on the throne. Immediately after his accession, the Persians invaded the Byzantine territories; an army was sent to repel them, and the war between the empires soon became general; a fierce contest of eight years' duration, which, chiefly owing to the internal convulsions that distracted Persia, resulted in favour of the Byzantines. The king of Persia, Khusru II., driven from his throne, fled to Hierapolis, whence he sent to M. a letter beseeching shelter and aid. The emperor's generous nature was not proof against such an appeal: an army was immediately assembled, to which the loyal Persians flocked from all quarters; and in 591, Khusru was restored to his throne, giving up to M., in evidence of his gratitude, the fortresses of Dara and Martyropolis, the bulwarks of Mesopotamia. Some time after these events, a war broke out with the Avars; and after two years of bloody conflict, with little gain to either side, the Byzantines suffered a severe defeat, and 12,000 veterans were taken prisoners. M. refused to ransom them, and they were consequently put to death. M.'s conduct has been satisfactorily accounted for (see Gibbon's *Decline and Fall*), but it excited a deep and lasting resentment amongst the people and the army; and in 602, when the emperor ordered his troops to take up their winter-quarters on the north (or Avarian) side of the Danube, they broke out into open revolt, elected Phocas for their chief, and marching upon Constantinople, raised him to the throne. M., with all his family and many of his friends, was put to death. He was a general of rare ability, and little inferior as a ruler.

**MAURITANIA**, or **MAURETANIA**, the ancient name of the most north-western part of Africa, corresponding in its limits to the present sultanate of Morocco and the western portion of Algiers. It

derived its name from its inhabitants, the *Mauri* or *Maurusi*. See MOORS. It reached on the south to the Desert, and was separated from Numidia on the east by the river Mulucha or Molochath, now the Muluya.

**MAURITIA**, a genus of palms, having male flowers and female or hermaphrodite flowers on distinct trees, imperfect spathes, and fan-shaped leaves. They are all natives of the hottest parts of America. Some of them, like the Buriti (q. v.) Palm (*M. vinifera*), have lofty columnar smooth stems; others are slender, and armed with strong conical spines. The MIRRI Palm (*M. flexuosa*) grows to the height of 100 feet; it has very large leaves on long stalks. The stem and leaf-stalks are used for various purposes. A beverage is made from the fruit, as from that of the Buriti Palm and several other species.

**MAURITIUS**, or ISLE OF FRANCE, an island of the Indian Ocean, belonging to Great Britain, lies in lat.  $19^{\circ} 58'$  to  $20^{\circ} 33' S.$ , and long. E. from Greenwich  $57^{\circ} 17'$  to  $57^{\circ} 46'$ . It contains about 708 square miles; pop. (1871), including the small dependencies of Seychelles, Rodrigues, &c., and exclusive of the military, 318,584, giving the very high average of 450 to the square mile. Of the total population, 210,636 were, in 1870, estimated to be Indian coolies. The surface is of varied formation, a great portion being volcanic; while its coast is fringed by extensive coral reefs, pierced in several places by the estuaries of small streams. Its mountains, although of no great height, are marked by the usual irregularities observed in volcanic formations. Of these, the most celebrated is the Peter Botte, situated in the rear of the town of Port Louis, and forming a remarkable cone, sustaining on its apex a gigantic piece of rock, which has the appearance of being poised upon its summit with the nicest precision. In the island are the remains of several small craters, and the traces of lava are numerous. The principal towns are Port Louis, the capital, and Grande Port, or Mahébourg, the southern port, the latter difficult of access for shipping, and much encumbered with coral reefs. Port Louis comprises a spacious harbour, and is provided with an inner basin, denominated the Fanfaron, wherein vessels can take refuge during the hurricanes, which occasionally occur here with exceeding violence. There is also a slip upon which large vessels can be raised for the purpose of examination and repair.

M. produces annually a large amount of sugar, which it exports to England, France, and Australia. The nature of the soil, however, in many parts prevents a more universal development of the culture of this article of commerce. In some districts, considerable tracts of cane-growing land are encumbered with large boulders; in many places, these have been collected into rough walls, between which the canes are planted, while in others their size precludes their removal. The method employed in the cultivation of the cane is similar to that adopted in the West Indies; but the bulk of the sugar is ultimately shipped in bags composed of the leaf of the *Vacoua* palm. The climate of this island is remarkably fine. There are four seasons, as in England; but the temperature in the months of November, December, and January is very high. Throughout the year, the thermometer ranges from  $76^{\circ}$  to  $90^{\circ}$  in the shade. In some of the more elevated districts, however, the climate resembles that of the hills of India, and the thermometer usually stands  $7^{\circ}$  or  $8^{\circ}$  lower than in Port Louis. The southern portion of the island, called La Savanne, is exceedingly beautiful, and diversified

with mountain and ravine, clothed with luxuriant wood. The mountains themselves are bold and fantastic, and present every possible form of outline. Few communities present so varied an admixture as that of Mauritius. The descendants of the original French inhabitants represent a considerable portion of the influential classes; government officials and merchants, or planters of English birth or extraction, make up the remainder. In Port Louis may be seen representatives of almost every eastern nation. Many Chinese find their way here, and there is now scarcely a hamlet that has not its Chinese storekeeper. The Creoles, or native coloured population, who derive their colour from the African and Malagash slaves, form a very considerable portion of the inhabitants. Emigration of coolies from British India, for the supply of the sugar-plantations, still continues. Two lines of railway were begun in 1860, and opened in 1863. Some much-needed sanitary measures have been carried out. Roads have been made, bridges built, and a light-house has been erected off Grande Port. At St Louis are spacious docks. Hospitals have been founded, and the establishment of savings-banks has proved beneficial. In March 1883, the island experienced a most calamitous hurricane; and during three or four years previous to 1871, a fearful epidemic raged. The revenue for 1871 amounted to £616,953, the expenditure to £500,382. In 1871, vessels having an aggregate burden of 401,935 tons, entered and cleared the ports of the island. The imports for the same year (chiefly livestock, rice, guano, grain, wine, machinery) were valued at £2,044,246; the exports (mainly sugar, with some rum and copper), at £3,120,529.

M. was discovered in the year 1505, by the Portuguese commander, Don Pedro Mascaregnha, and was subsequently visited by the Dutch under Van Neck in 1598, who gave the island its present name in honour of Prince Maurice. The Dutch formed a settlement here in 1644, but subsequently abandoned it. A new and more successful attempt to form a permanent establishment was made by the French in 1721, already in possession of the adjacent island of Bourbon, who re-named it 'Île-de-France.' M. remained in French hands until near the close of the year 1810, when it was taken by the British in an expedition under General Abercromby, and has since remained a British possession.

**MAUROCORDATOS**, also **MAVROCORDATO**, a Fanariote family, distinguished for ability and political influence, and descended from merchants of Chios of the Genoese family of Sciolati.—ALEXANDER M. was professor of medicine and philosophy in Padua, and became dragoman or interpreter to the Porte in 1681, in which capacity he did much to promote the interests of his countrymen. In 1699, he displayed great diplomatic talents as plenipotentiary of the Porte in the negotiations for peace at Carlowitz.—His son, NICOLAS, was the first Greek who was Hospodar of Moldavia and Wallachia.—CONSTANTINE, brother of Nicolas, who became Hospodar of Wallachia in 1735, abolished slavery in that country, and introduced the culture of maize.—His grandson, ALEXANDER, Prince M., born at Constantinople in 1788, took an active part in the Greek contest for independence, prepared the declaration of independence and the plan of a provisional government, was elected president of the executive body; and being appointed commander-in-chief, undertook, in 1822, an expedition to Epirus, which ended in the unsuccessful battle of Peta; but he delivered the Peloponnese by his bold and resolute defence of Missolonghi (1823). Notwithstanding the opposition of the party

## MAURY—MAXIMILIAN I.

locotronis and Dimitrios Ypsilanti, he was afterwards to render important services to his country—as, for instance, by the heroic defence of Ilio and Sphacteria; but became very much engaged in political strife. He was a steadfast supporter of English policy and institutions, and an opponent of the pro-Russian government of D'Ishtria. After the accession of King Otho, he was at different times a cabinet minister and ambassador at different courts. The leading feature of his policy—viz., his endeavour to promote British influence—made him at times very unpopular with his countrymen. Yet, at the outbreak of the Crimean War, it was found necessary to place him once more at the head of the government—a dignity, however, which he soon resigned; but he continued to rest himself in the cause of education, and as from 1861 held the office of minister of public instruction. He died August 1865.

**MAURY, MATTHEW FONTAINE, LL.D.**, an American officer, astronomer, and hydrographer, born in Virginia, January 14, 1806. In 1825, he was appointed midshipman in the United States Navy, and during a voyage round the world in the USS frigate, commenced a treatise on navigation, which is adopted as a text-book in the navy. He was made lieutenant; but being lame by accident, and unfitted for service afloat, he was ordered to the Hydrographical Office at Washington, where he carried out a system of observations enabled him to write his *Physical Geography of the Seas*, and to produce in 1844 his works on *If Stream, Ocean Currents, and Great Circle Sailing*. He projected the maritime conference at London (1853); and with the co-operation of the government, and the assistance of naval officers and the learned, completed his sailing charts, a great advantage of the commerce of the world. In 1855, he was promoted to the rank of commodore, and published *Letters on the Amazon and the Atlantic Slopes of South America*. At the outbreak of the civil war in 1861, M. took a command of the Confederate navy, and afterwards came as a prisoner to Europe. After the war, he returned to the United States.

**MAUSOLEUM**, a sepulchral monument of large size, containing a chamber in which urns or coffins were deposited. The name is derived from the tomb at Halicarnassus to Mausolus, king of Caria, a disconsolate widow, Artemisia, 353 B.C. It is one of the most magnificent monuments of the ancient world, and was esteemed one of the seven wonders of the world. It was described by Pliny and other writers, as late as the 12th c., and must have been overthrown, probably by an earthquake, in the following two centuries, for all trace of it disappeared, except some marble steps, the Knights of St John of Jerusalem, in 1494, took possession of the site of Halicarnassus, occupied by a small village called Cleesay. In excavating among the ruins for building materials, the knights discovered a large chambered with marble pilasters, and with richly carved anels. The sarcophagus of the founder was covered in another great hall. Excavations have been recently made by Mr. Pitt Rivers, assisted by the British government, and succeeded in bringing to light many of the lost sculptures of the Mausoleum. Amongst the fragments of the statue of King Mausolus (now joined together in the British Museum), and a fragment of the Quadriga which crowned the monument, many fragments of lions, dogs, &c., and a fragment of a horse, have been found. Also fragments of friezes, of fine design and workmanship,

the subjects of which invariably are Greeks in conflict with Amazons, have also been dug up.

The plan of the basement has been traced, the area being 126 feet by 100 feet; and from the fragments of columns, Ionic capitals, &c., which have been found, the description of Pliny has been verified. The Mausoleum consisted of a basement 65 feet high, on which stood an Ionic colonnade 23½ feet high, surmounted by a pyramid, rising in steps to a similar height, and on the apex of which stood a colossal group, about 14 feet in height, of Mausolus and his wife in the Quadriga; these statues are supposed to be the work of the celebrated Scopas. The above dimensions are from Mr. Newton's restoration, but they are disputed by Mr. Fergusson, and others. All agree that the total height of 140 feet given by Pliny is probably accurate.

**MAUVE.** See DYE-STUFFS.

**MAW-SEED**, a name by which Poppy-seed (*Papaver somniferum*) is sold as food for cage-birds. It is given to them especially when they are moulting.

**MAXIMILIAN I.**, one of the most distinguished of the German emperors, the son and successor of Frederick III., was born at Neustadt, near Vienna, 22d March 1459. In his 19th year, he married Maria, the only child and heiress of Charles the Bold, Duke of Burgundy, and was soon involved in war with Louis XI. of France, who attempted to seize some of her possessions. M., although successful in the field, was compelled, by the intrigues of Louis in the Netherlands, and disaffection stirred up there to betroth his daughter, Margaret, a child of four years old, to the Dauphin, afterwards Charles VIII., and to give Artois, Flanders, and the duchy of Burgundy as her dowry. In 1486, he was elected king of the Romans. Insurrections in the Netherlands, encouraged and supported by France, occupied much of his time, and again involved him in war with Louis XI. He afterwards repelled the Hungarians, who had seized great part of the Austrian territories on the Danube; and the Turks, who in 1492 invaded Carinthia, Carniola, and Steiermark. He again took up arms against France, because Charles VIII. sent back his daughter, and married Anne of Bretagne, in order to acquire that great province. A peace was, however, soon concluded at Senlis in 1493, M. receiving back the provinces which he had given with his daughter. On the death of his father in 1493, he became emperor, and he subsequently married Bianca Sforza, daughter of the Duke of Milan. He applied himself with wisdom and vigour to the internal administration of the empire, took measures for the preservation of peace in Germany, and encouraged the cultivation of the arts and sciences. But he was soon again involved in wars against the Swiss, the Venetians, and France. He sought to put a stop to French conquests in Italy, and was at first successful; but after various changes of fortune, and years of war, mingled with many political complications, he was compelled to give up Milan to France, and Verona to the Venetians. Nor was M. more successful against the Swiss, who in 1499 completely separated themselves from the German empire. The hereditary dominions of his House, however, were increased during his reign by several peaceful additions; and the marriage of his son Philip with the Infanta Juana, and of his daughter Margaret with the Infant Juan of Spain, led to the subsequent union of Spain with Austria; whilst the marriage of two of his grandchildren with the son and daughter of Ladislaus, king of Hungary and Bohemia, brought both these kingdoms to the Austrian monarchy. M. died at Wels, in Upper

## MAXIMILIAN II.—MAYENNE.

Austria, 12th January 1519. He was of a chivalrous character. He wrote various works on war, gardening, hunting, and architecture, and an autobiography full of marvels. He produced also some poems.

**MAXIMILIAN II., JOSEPH**, king of Bavaria, son of Ludvig I., was born 28th November 1811. He married in 1842 the Princess Maria Hedwig, cousin to the present king of Prussia. Until 1848 he took no part in political affairs, but devoted himself to agricultural and other improvements, and to the pursuits of literature and science. In that year of the revolutionary excitement, he was suddenly called to the throne, on his father's abdication, and adopted a policy accordant with the liberal tendencies of the time. Reactionary measures were afterwards to some extent adopted; but M.'s reign was chiefly signalised by the encouragement of science. He was regarded with no favour by the ultramontane party, but without respect to their opposition, he brought to Munich men of liberal opinions, eminent in literature and science. He died March 1864.

**MAXIMUM**, in Mathematics, the greatest value of a variable quantity or magnitude, in opposition to *minimum*, the least. More strictly, a maximum is such a value as is greater than those immediately preceding and following it in a series; and a minimum is a value which is less than those immediately preceding and following it, so that a function may have many maxima and minima unequal among themselves, as in the case of a curve alternately approaching and receding from an axis. Traces of the doctrine of maxima and minima are to be found in the works of Apollonius on Conic Sections. The thorough investigation of them requires the aid of the differential calculus, and even of the calculus of variations. The brothers Bernoulli, Newton, Maclaurin, Euler, and Lagrange, have greatly distinguished themselves in this department of mathematics. The Hindus have displayed great ingenuity in solving, by ordinary algebra, problems of maxima and minima, for which, in Europe, the calculus was considered to be necessary.

**MAY** [Lat. *Maius*, contracted from *Magius*, is from a root *mag*, or (Sana) *mah*, to grow; so that May is just the season of growth], the fifth month of the year in our present calendar, consists of 31 days. The common notion, that it was named *Maius* by the Romans in honour of *Maia*, the mother of Mercury, is quite erroneous, for the name was in use among them long before they knew anything either of Mercury or his mother! The outbreak into new life and beauty which marks nature at this time, instinctively excites feelings of gladness and delight; hence it is not wonderful that the event should have at all times been celebrated. The first emotion is a desire to seize some part of that profusion of flower or blossom which spreads around us, to set it up in decorative fashion, pay it a sort of homage, and to let the pleasure it excites find expression in dance and song. Among the Romans, the feeling of the time found vent in their *Floralia*, or Floral Games, which began on the 28th of April, and lasted a few days. The first of May—**MAY-DAY**—was the chief festival both in ancient and more modern times. Among the old Celtic peoples, a festival called *Beltein* (q.v.) was also held on this day, but it does not seem to have been connected with flowers. In England, as we learn from Chaucer and other writers, it was customary, during the middle ages, for all, both high and low—even the court itself—to go out on the first May morning at an early hour 'to fetch the flowers fresh.' Hawthorn (q.v.) branches were also gathered; these were brought home about sunrise,

with accompaniments of horn and tabor, and all possible signs of joy and merriment. The people then proceeded to decorate the doors and windows of their houses with the spoils. By a natural transition of ideas, they gave the hawthorn bloom the name of the 'May'; they called the ceremony 'the bringing home the May'; they spoke of the expedition to the woods as 'going a-Maying.' The fairest maid of the village was crowned with flowers as the 'Queen of the May'; placed in a little bower or arbour, where she sat in state, receiving the homage and admiration of the youthful revellers, who danced and sang around her. This custom of having a May queen looks like a relic of the old Roman celebration of the day when the goddess *Flora* was specially worshipped. How thoroughly recognised the custom had become in England, may be illustrated by the fact, that in the reign of Henry VIII. the heads of the corporation of London went out into the high grounds of Kent to gather the May—the king and his queen, Catharine of Aragon, coming from their palace of Greenwich, and meeting these respected dignitaries on Shooter's Hill. But perhaps the most conspicuous feature of these festive proceedings was the erection in every town and village of a fine pole—called the Maypole—as high as the mast of a vessel of 100 tons, on which, each May morning, they suspended wreaths of flowers, and round which the people danced in rings pretty nearly the whole day. A severe blow was given to these merry customs by the Puritans, who caused Maypoles to be uprooted, and a stop put to all their jollities. They were, however, revived after the Restoration, and held their ground for a long time; but they have now almost disappeared. In France and Germany too, Maypoles were common, and in some places are still to be seen, and festive sports are even yet observed.—See *Chambers's Book of Days*, pp. 569–582, vol. i.

**MAY-FLY.** See *EPHEMERA*.

**MĀYĀ** is, in the Puranic mythology of the Hindus, the personified will or energy of the Supreme Being, who, by her, created the universe; and as, in this later doctrine, the world is unreal or illusory, M. assumes the character of *Illusion* personified. In this sense, M. also occurs in the later Vedānta philosophy, and in some of the sectarian philosophies of India.

**MAYBOLE**, a burgh of regality, in the county of Ayr, Scotland, 9 miles south of the town of that name, and on the line of the Ayr and Girvan Railway. Pop. 3800, who are mostly shoemakers and weavers. In feudal times it was considered the capital of Carrick, and was the seat of the courts of justice of the Carrick bailiery. In the vicinity of M. are the ruins of the famous Abbey of Crossraguel, the head of which, at the time of the Reformation, was Quentin Kennedy, who held a public disputation with John Knox in the town of Maybole. The house where the disputation took place is still shewn.

**MAYENCE.** See *MAINZ*.

**MAYENNE** (Lat. *Meduana*), a river in the north-west of France, which rises in the department of Orne, and after, being joined on the right by the Varenne, Calmont, Ernée, and Oudon, and on the left by the Jouanne and Ovette, debouches at Pont de Cé into the Loire, under the name of the Maine, having become navigable 50 miles south of Mayenne.—This river gives its name to the department of **MAYENNE**, which has been formed from the western part of the old province of Maine and the north of Anjou. For its area and population, see *FRANCE*. Mayenne, which is included almost

# MAYENNE—MAYO.

entirely within the basin of the Loire, has a mild climate, but only a partially productive soil, being occupied in many districts by extensive sandy heaths. The chief branches of industry are the breeding of cattle and sheep, and the rearing of bees; while the iron mines and marble quarries of the district yield employment to the poorer classes. The linen, hemp, and paper manufactures are of some importance. Mayenne is divided into the three arrondissements of Laval, Château-Gontier, and Mayenne.

**MAYENNE**, chief town of the department of the same name, is situated on the Loire, on the right bank of which rises, on a steep and rocky height, the ancient fortress of the dukes of Mayenne. Lat. 48° 14' N., long. 0° 35' W. The town is pleasantly situated, has several good squares, and some fine fountains; but it is especially remarkable for the extreme steepness of its narrow and winding streets. Manufactures of calico and linen. Pop. 32,277.

**MAYNOOTH**, a village of the County Kildare, Ireland, 15 miles north-west from Dublin by the Midland Great Western Railway; population (including the college) 2200. It is of some historical interest as the seat of the powerful family of the Geraldines, of whose castle large and very striking ruins still remain; and as the scene of more than one struggle with the English power, especially the 'Rebellion of Silken Thomas,' in the reign of Henry VIII., and in the war of the Confederates (1641—1650). But its chief modern interest arises from the well-known Roman Catholic college, which supplied for many years material for strife to the zealots of the rival religious parties in Great Britain. This college was established during the ministry of Mr Pitt, in the year 1795, by an act of the Irish parliament, in order to meet a necessity created by the utter destruction, through the French Revolution, of the places of education in France upon which the Irish Catholic clergy, excluded by the penal laws from the opportunity of domestic education, had hitherto been driven to rely. The original endowment, an annual vote of £8928, was continued, although not without sustained opposition, by the imperial parliament after the act of union. In the year 1846, Sir Robert Peel carried a bill for a permanent endowment of £26,000 a year, to which was added a grant of £30,000 for building purposes. The building erected under the original endowment is a plain quadrangle. The new college is a very striking Gothic quadrangle by Pugin, containing professors' and students' apartments, lecture-halls, and a singularly fine library and refectory. Pugin's design included a chapel and common-hall, which, owing to insufficiency of funds, have been postponed. Under the act of 1845, the college was to receive 500 students, all destined to the priesthood. The patronage of the 500 scholarships was divided in the ratio of population among the bishops of the several sees of Ireland; but the candidates thus named were subjected, before matriculation, to examination in a comprehensive entrance course. The full collegiate course was of eight years, two of which were given to classics, two to philosophy, and the remaining four to the more directly professional studies of divinity, scripture, church history, canon law, and the Hebrew and Irish languages. The divinity students, 250 in number, received a money stipend of £20 annually; and at the close of the ordinary course, 20 scholars, called from the founder, Lord Dunboyne, 'Dunboyne Scholarships,' were assigned by competition to the most distinguished students, and might be held for three years. The legislative authority was vested in a board of 17 trustees, and the internal administration in an academical body, consisting of

a president and vice-president, together with a numerous body of professors and deans. A visitatorial power was vested in a board of 8 visitors, of whom 5 were named by the crown, and three elected by the trustees. In 1869, by the Irish Church Act (32 and 33 Vict. c.38—41), the Maynooth endowment was withdrawn—a capital sum, fourteen times its amount being granted to the trustees for the discharge of existing interests. The college, however, is still maintained on the same footing. The educational arrangements are unaltered, and although the number of pupils, owing to the suspension of free studentships and exhibitions, has somewhat fallen off, the diminution is regarded as temporary. The visitatorial powers created under the act of parliament are now exercised by visitors appointed by the trustees, and all state connection is at an end. The college also possesses some landed and funded property, the result of donations and bequests, the most considerable of which is that of Lord Dunboyne, who having been Roman Catholic Bishop of Cork, and having for a time conformed to the Protestant faith, returned before death to his ancient belief.

**MAYO**, a maritime county of the province of Connaught, Ireland, is bounded on the N. and W. by the Atlantic Ocean, E. by Sligo and Roscommon, and S. by Galway. Area, 1,363,882 acres, of which 497,587 are arable; pop., which in 1861 was 254,449, had fallen in 1871 to 245,855, of whom 238,163 were Roman Catholics, 6195 Protestant Episcopalians, and the rest Protestants of other denominations. The coast-line of M. is about 250 miles. The surface is very irregular, the interior being a plain bordered by two ranges of mountains. Of these ranges, the highest points are Croagh Patrick, 2610 feet, and Nephin, 2646 feet in height. The soil of the plain is fertile, and for the most part suitable either for tillage or for pasture, although the prevalence of rain and ungenial winds render tillage, especially of wheat and potatoes, precarious and unremunerative. The number of acres under crop in 1872 was 200,971. The rearing of cattle forms in most parts of the county the more ordinary pursuit of the agricultural population. In 1872, the number of cattle was 141,188; of sheep, 340,163; and of pigs, 51,569. Ironstone abounds in some districts, but, owing to want of fuel, no attempt is made to work it. An excellent marble is found in the north-western district, and there are several places in which slates are successfully quarried. The chief towns are Castlebar, Westport, Ballina, and Ballinrobe. Almost the only occupations of the population are agriculture and fishing. A valuable salmon-fishery exists in the river Moy; and the small lake of Lough Mask is the habitation of the well-known 'gillaroo' trout. The Irish language is still spoken in a large part of Mayo. The number of national schools in 1861 was 243, attended by 47,041 pupils, almost all without exception Roman Catholics.

M. formed part of the extensive territory granted by Henry II. to William de Burgho; but in the middle of the 14th c., one of the younger branches of the family, seizing on the counties of Galway and M., threw off the English allegiance, adopted the 'customs of the Irishry,' together with the Celtic name of MacWilliam. In the year 1575 the MacWilliam made his submission at Galway; but having subsequently revolted, the district was finally subdued by Sir Richard Bingham in 1586. The antiquities of M. are chiefly ecclesiastical. Four round towers are still in existence, and there are at Cong the remains of a splendid abbey, which dates from the 12th century. The celebrated 'Cross of Cong,' now in the Museum of the Royal Irish

Academy, was the archiepiscopal crosier of Tuam, once preserved in the abbey of that name.

**MAYOR** (Fr. *maire*, Lat. *major*; see **MAOR**), originally a steward, bailiff, or overseer, thence the chief magistrate of a city or corporate town in England or Ireland. The mayor is the head of the local judicature, and the executive officer of the municipality; he is elected by the council from the aldermen or councillors, and holds office for a year only. His duties include those of returning officer in all burghs except those cities and towns which, being counties of themselves, have sheriffs of their own. The first Mayor of London was appointed in 1189, the first Mayor of Dublin in 1409. The mayors of London, York, and Dublin are called 'Lord Mayor.' The Lord Mayor of London has the title of 'Right Honourable,' which, along with the title 'Lord,' was first allowed by Edward III. in 1354; is the representative of royalty in the civil government of the city, the chief commissioner of lieutenantancy, the conservator of the river Thames; and on the demise of a sovereign, he becomes, *pro tempore*, a member of the Privy Council. To sustain the hospitality of the city, he receives an allowance of £8000 a year, with the use of the Mansion-house, furniture, carriages, &c. He is chosen by the Livery (q. v.) on the 29th September, being commonly the senior alderman, who has been sheriff, but not Lord Mayor. In former times, it was the ambition of the first merchants and bankers of the City to become Lord Mayor; but since the district within the metropolitan boundaries has come to be but a small fraction of what is generally known as London, this has ceased to be the case; and it is only in the eye of foreigners that the Lord Mayor of London is one of the most important public functionaries of the realm. The Mayor of Dublin was first styled Lord Mayor by Charles II. in 1665.

**MAYSVILLE**, a city of Kentucky, United States of America, on the Ohio River, 63 miles south-east of Cincinnati. It is finely situated, is the river-port of a rich territory, and the largest hemp-mart in America. It has extensive manufactories of cotton, hemp, tobacco, iron, and coal-oil. It contains the county buildings, city-hall, market, 2 banks, 90 stores, 7 churches. Pop. (1870) 4705.

**MAZANDERAN**, a province of Persia, bounded on the north by the Caspian Sea. It consists for the most part of a tract of low coast-land, about 200 miles in length by 50 in breadth. Along the shore of the Caspian, the land is marshy, but further inland, the surface becomes elevated. The climate cannot be called salubrious, although it is more healthy than that of the neighbouring province of Ghilan. The soil is fertile; rice, cotton, mulberry, sugar-cane, and a variety of fruits, are produced. It exports silk, cotton, and rice to Russia, and imports woollen goods, cutlery, tobacco, &c. Throughout the whole province, parallel with the shores of the Caspian, extends a causeway, constructed by Shah Abbas the Great in the 17th c., and still in good repair. Pop. of the province, about 150,000; capital, Sari (q. v.).

**MAZARIN, JULES** (Ital. *Giulio Mazarini*), cardinal and chief minister of France during the minority of Louis XIV., was born 14th July 1602 at Rome, or, some say, at Piscina in the Abruzzi. The social position and occupation of his father are points in dispute. M. studied law at Rome and at the Spanish universities, where he contrived to unite industry with amorous gaiety. Afterwards, he entered the pope's military service, perhaps about 1624. Having accompanied a papal legate to the

court of France, he became known to Richelieu about 1628, who perceived his great talents, and engaged him to maintain the French interests in Italy, which he did while still employed by the pope as vice-legate to Avignon (1632), and nuncio to the French court, as to which he was appointed in 1634. The Spaniards complained of his partiality for France, and the pope was obliged to recall him. The subsidy was not thus to be checkmated. In 1641 M. openly entered the service of Louis XIII., and was naturalised a Frenchman; and in 1641 received the cardinal's hat, through the influence of Richelieu, who, when dying, recommended M. to the king as the only person capable of carrying on his system. M.'s position was one of great difficulty amidst the intrigues, jealousies, and strifes of the earlier years of Louis XIV.'s minority. The queen-mother, Anne of Austria, was at first particularly hostile to him; but although she declared sole regent and guardian of the king, M. kept his place as minister, and made himself indispensable to her, partly by his wonderful business qualities, and still more by the exquisite charm of his manner, so that, although with greater smoothness, he ruled with almost unlimited sway as Richelieu. The parliament, thinking to regain political power, resisted the registration of edicts of taxation; but M. and the leaders of the opposition to be arrested, which the disturbances of the Fronde began. The court retired to St Germain; but when outlawed by the parliament; but by the return of Richelieu, he still remained minister. The king, however, became still more intransigent when, at his instigation, the queen-regent, the Princes of Condé and Conti and the Duke of Longueville to be arrested in January 1653, went in person at the head of the court to the insurgent provinces; and after the victory at Rethel, shewed so much insolence, that the king and the people of the capital made common cause against him, and he thought it necessary to his safety by flight to the Netherlands, where the press teemed with violent publications against him known as *Mazarinades*. After the rebellion of the Prince of Condé, he ventured to return to France, but Paris making his removal a condition of submission, he retired again from the court. It was not till February 3, 1653, that he effected his triumphant entry into the capital, which was received with significant silence. Yet in a short time he was popular, and had acquired his former power. Under him, the influence of France amongst the nations was increased, and the internal government of the country those principles of despotism were established on which Louis XIV. afterwards acted. The administration of justice, however, became very corrupt, and commerce and finances of the country sunk into deep depression. It is admitted that as a financial administrator he was far inferior to Richelieu, who died at Vincennes, 9th March 1661. He was miserably and very avaricious, and had a taste for various ways, fair and foul, an immense fortune amounting to 12,000,000 livres, which he bequeathed to the king shortly before he died; afraid, perhaps, that it might be rudely seized by his heirs. Louis declined the restitution, which perhaps what the wily minister expected. M. was privately married to Anne of Austria. See *Memoirs of M.'s contemporaries*, Retz, &c.; *Motteville*, La Rochefoucault, Turenne, &c.; *Siecle de Louis XIV.*, by Voltaire; *A. Longueville*, &c., by Victor Cousin; and *A. Les Nièces de Mazarin*.

# MAZATLAN—MAZZINI.

**MAZATLAN**, a seaport of Mexico, at the mouth of a river of its own name, which falls into the entrance to the Gulf of California, lat. 23° 10' N., long. 106° 21' W. It is a well-built and picturesque town. The climate is healthy, but very hot (85° to 95° in the shade during August). Pop. from 12,000 to 15,000—a mixed race of old Aztec Mexicans, Indians, Spaniards, and negroes. The chief exports to California and Europe are silver dollars, Brazil or Lina wood, and copper; imports, provisions, machinery, British hardware and crockery, and dry goods from France and Germany. In 1864, the town was besieged by the French and imperial troops. The harbour of M., though much exposed to winds from the south-west, is the most important on the Mexican coast.

**MAZEPPA**, JAN ('JOHN'), hetman of the Cossacks, was born about 1645, and was descended of a poor but noble family of Podolia. He became a page in the service of John Casimir, king of Poland. A Polish nobleman, having surprised him in an intrigue with his wife, caused him to be stripped naked, and bound upon his own horse, lying upon its back, and with his head to its tail, and sent the animal off, leaving M. to his fate. The horse carried him to his own distant residence—not to the Ukraine, as has been often said; but M., out of shame, fled to the Ukraine, joined the Cossacks, and by his strength, courage, and activity, rose to high distinction amongst them, and in 1687 was elected their hetman. He won the confidence of Peter the Great, who loaded him with honours, and made him Prince of the Ukraine; but on the attainment of the freedom of the Cossacks by Russia, M. conceived the idea of throwing off the sovereignty of the czar, and for this purpose entered into negotiations with Charles XII. of Sweden. These and other treasons were revealed to Peter the Great, who did not credit the informants; but afterwards, being convinced of M.'s guilt, caused a number of his accomplices to be put to death. M. joined Charles XII., and took part in the battle of Poltava, after which he fled, in 1709, to Bender, and there died in the same year. His story has been made the subject of a poem by Byron, of a novel by Bulgarin, and of two paintings by Horace Vernet.

**MAZURKA**, a lively Polish dance of the grotesque kind, the music of which is sometimes in time, but more commonly in 3. The peculiarity of the rhythm, which has a pleasing effect, is what characterises the music of the Mazurka. It is danced by four or eight pairs, and is much practised in the north of Germany, as well as in Poland.

**MAZZARA**, a city of the island of Sicily, 26 miles south of Trapani, stands in a fine plain on a sea-shore. Pop. 11,000. It is enclosed by walls, and has a cathedral, an episcopal palace, a college, and several convents. It has a considerable trade in cotton, which is extensively grown in the neighbourhood.

**MAZZARINO**, a town of Sicily, in the fertile province of Caltanissetta, and 15 miles south-east of the town of that name. Pop. 11,600.

**MAZZINI**, GIUSEPPE, one of the most remarkable men of modern Italy, was born in 1808 at Genoa, his father being a physician of note, and of private means. In youth, M. was noted for the warmth of his friendships, the fixity of his will, and the exaggerated susceptibility of his humane feelings. From birth, sentiments of social equality were engendered in him by the example of his parents; and very early the degraded political condition of his country began to prey upon his mind, producing ardent aspirations for her national

unity and deliverance from foreign domination, which seemed to him attainable only through a return to the republican glories of ancient times. M.'s patriotic enthusiasm speedily gained absolute sway over his spirit, and led him to renounce his cherished idea of a life of literature and contemplative study, for the action and strife of the political arena. In 1827, his maiden essay in literature, 'Dell' Amor Patrio di Dante,' appeared in the liberal journal, the *Subalpino*; and he subsequently contributed critical, literary, and political papers to the *Antologia* of Florence and the *Indicatore Genovese*. In the pages of this latter originally appeared the essay subsequently republished under the title of *Scritti d'un Italiano Vivente*. Literature, according to M.'s own assertion, having been employed by the liberal party solely as a means for the great end of liberal propagandism, the journals were suppressed, and the writers disbanded. In 1830, the affiliation of M. to the secret society of the Carbonari was the introductory step to his practical political career; and the young member was speedily invested with a preponderating influence in the counsels and missions of the body. Insnared and betrayed by a Piedmontese spy, M. was arrested, detained for six months in the fortress of Savona, and finally liberated on condition of his departure from Italy. After short residences in several places, he took up his abode in Marseille, and thence he addressed to Charles Albert his famous letter, which drew down on the daring young writer a decree of perpetual banishment. The organisation of a new liberal league, 'Young Italy,' was M.'s next work. Republican and unionist to the core, the tendencies of this great body were more humanitarian and universal than its extinct predecessor, Carbonarism. In addition to the paramount aim of Italy's republican union under one common law, and the extinction of foreign rule, the general principles of this new association enforced the universal obligation to labour for a common moral regeneration, and the establishment of political equality over the world. Liberty, equality, and humanity were the watchwords of the body; 'God and the People' their motto; white, red, and green their tricolored banner; education and insurrection the great agencies of their operations; assassination was erased from their statutes, and the symbolic dagger of the Carbonari was replaced by the more humane emblems of a book and the cypress. M. was the animating spirit of this formidable league, which speedily enclosed all Europe in a network of similar associations, modified to meet the individual requirements of the various European nationalities. Banishment from Marseille, in consequence of the extensive operations of the society having been revealed to the authorities, compelled M. to resort to concealment for a period of several months. About this time, a charge was brought against him of advocating assassination as a legitimate weapon in the warfare of liberalism; but the charge was proved in the public tribunals of France to be false; and in the British parliament (1845), Sir James Graham made an apology to M. for having re-echoed the calumny. The first-fruits of *La Giovine Italia* was the revolutionary expedition of Savoy, organised by M. at Geneva, but which was defeated by the royal troops. Sentence of death, *par contumace*, was recorded against M. in the Sardinian courts for his participation in the affair; but he soon recommenced with increased vigour his revolutionary operations. A new association, entitled 'New Europe,' and based on principles of European rights and enfranchisement, was inaugurated by the exertions of M. in Switzerland. In 1837, M. quitted Switzerland for England, and

finally took up his abode in London. From thence, his labours in the Italian revolutionary cause have been incessant. To trace the part enacted by M. in the great crisis of 1848 would be to record the history of that period, so intimately were his individual acts connected with the course of events. The resolute combatant of partial union and monarchical leadership at Milan, M. retired to Switzerland on the capitulation of Milan to the Austrians, to reappear in Florence on the rising of Tuscany, and finally at Rome, where he was elected triumvir amidst the triumphant rejoicings of the capital of Italy. His tenure of supreme authority was marked by such wisdom, moderation, and success, as to elicit a public tribute of approbation from Lord Palmerston. On the surrender of Rome by M.'s advice, he quitted the city, and proceeded to Lausanne *viâ* Marseille. The conduct of France he bitterly attacked in public letters to De Tocqueville and others. He subsequently returned to London, and at his instigation, risings in Milan (1853) and in Piedmont (1857) were attempted. In 1859, while lending the whole weight of his influence to the revolutionary movements going on in Italy, he combated with vigilant foresight the threatened French predominance, and refused to accord faith to the liberal programme of Louis Napoleon. The Sicilian expedition of 1860 owed as much to the organisation of M. as to the heroic command of Garibaldi (q. v.). In 1864, he was expelled from Switzerland, and returned again to England. Next year he was elected by Messina deputy to the Italian parliament; but the election, to which he himself as a republican would have declined to accede, was cancelled by the parliament. M. is said to have founded in 1865 the 'Universal Republican Alliance.' In 1868, he fell into a dangerous illness, from the effects of which his health never recovered, though his zeal remained as ardent as ever. After an ineffective scheme for a republican rising, M. ventured to enter Italy, and was arrested at Gaeta, where he remained a prisoner till Rome was taken by the Italian army. He condemned the Parisian Commune of March 1871. On his death at Pisa, 11th March 1872, the Italian government honoured him with a public funeral.

M.'s writings are various and extensive, and include dissertations on art, literature, and music. A complete edition (*Scritti, Editi e Inediti*) was published in 1861 and following years. Whatever may be thought of M.'s political views, few will refuse to admire the ardent sincerity of his patriotism, or the inflexibility with which he has pursued his aim, unchecked by persecution, calumny, and defeat. M. possessed in the highest degree that personal fascination by which friends are converted into ardent partisans. In his private life, he is allowed to have been a model of purity and frugal simplicity, as in his public career he was conspicuous for disinterestedness and self-abnegation; and to these personal virtues of M., aided by his extraordinary influence and eloquence, those who know Italy best ascribe a great share at least in inspiring that higher tone of life manifest in recent years among the Italian youth, without which the political regeneration of the country would have been impossible.

**MEAD**, a fermented liquor made from honey. The honey is mixed with water, and fermentation is induced and conducted in the usual manner. Cottagers sometimes use the honey which remains in the combs after the usual processes of dropping and squeezing, for making mead, which is a thin and very brisk, but at the same time luscious beverage. Mead has been in use from very ancient times, and was known equally to the polished nations of

Southern Europe and the barbarous tribes of more northern regions. Pliny says it has all the best qualities of wine, but not the good ones. The Latin name is *Hydromeli*.

**MEADOW GRASS** (*Poa*), a genus of Grasses, having a loose spreading panicle, the spikelets usually containing a number of florets, and with two glumes shorter than the florets, the florets each having two paleæ, which are bluntish and awnless, the fruit free. The species are very numerous, chiefly natives of the temperate and colder parts of the world, and forming in these a very important part of the herbage of pastures and meadows. Most of the species are of a slender and delicate appearance, with small spikelets and florets; and the herbage is tender, nutritious, and rather abundant. Of the British species, the **ROUGH-STALKED M. G.** (*P. trivialis*) and the **SMOOTH-STALKED M. G.** (*P. pratensis*) are among the most common, and are esteemed among the most valuable for sowing in mixtures of grasses for pasture.—The **ABYSSINIAN M. G.** (*P. Abyssinica*), an annual species, yields immense returns of herbage in its native country, but a warmer climate than that of Britain seems to be requisite for its successful cultivation. It is called *Teff* in Abyssinia, and its seeds are used as corn for making bread. Beer is made by putting slices of this bread into warm water, the temperature of which is kept up in a close vessel for some days.—*P. annua* is an extremely common British species, springing up continually as a weed in cultivated grounds, and abounding on waysides as well as in pastures. It is often to be seen in flower, even in winter, and in summer is said to ripen its seeds in four or five weeks from the time of sowing. It is employed with advantage for sowing on greens in towns, and wherever from any cause perennial grasses are apt to be destroyed. It is very abundant in most parts of Europe, and Dr Hooker found it at one of the most elevated passes of the Himalaya Mountains.—**Manna Grass** (q. v.) is closely allied to this genus.

**MEADOW SAFFRON.** See **COLCHICUM**.

**MEADOWS**, a term somewhat indefinitely applied to moist level lands covered with grass, which is usually rich in consequence of the moisture, and often also from advantages of soil. The grass is either used for pasture, or is mown and carried away. *Water Meadows* are meadows in which the supply of water is increased and regulated by artificial irrigation. See **IRRIGATION**. The herbage of all meadows consists generally of various kinds of grasses; meadow-grass, rye-grass, timothy, fox-tail, and bent-grass or foin, predominating.

**MEAL** (Sax. *mal*, a part or portion; Ger. *mahl*), a portion of food taken at one time, a repast. The number of meals eaten per day has varied at different times and in different countries. Among the Greeks and Romans of the classic ages, it was the general practice to have the principal meal towards evening, a light meal in the morning, and another in the middle of the day. The *akratema*, *ariston*, and *deipnon* of the Greeks, corresponded nearly to the breakfast, luncheon, and dinner of our own country at the present time; the first was taken immediately after rising in the morning, the second about mid-day, and the *deipnon*, the principal meal, often not till after sunset. In Rome of the Augustan age, the three corresponding meals were *jentaculum*, *prandium*, and *cena*. The two former were simple and hasty, except among persons of luxurious habits, with whom the mid-day meal was sometimes of an elaborate description. The *cena*, taken in the evening, consisted of three courses, with often a great variety of viands. Reclining

## MEAL—MEASLES.

usual posture at meals for the men, the children sitting. Two persons, and by three, reclined on one couch. Before a place at table, his shoes were taken off, and his feet washed by an attendant.

In the middle and modern Europe, the prevailing custom nearly to the middle of last century, was to have three meals in the day, the mid-day, and evening meal, being the principal one. The middle classes were early; four was a usual dinner, and five for breakfast. Twelve was the dinner-hour, when it was the usage in England at Queen Elizabeth's time for every table, of the twenty-shilling freeholder, to the baron's hall and abbey refectory, to be all-comers, with free fare, bread, beef

Supper followed in the evening, a less repetition of dinner. In the course of the last century, a revolution has been going on in the dinner, which has gradually got later till it reached the present usage of from six to seven in the evening among the more cultivated. The introduction of tea and coffee has, to a great extent, changed our habits as regards meals. They form an essential part of our breakfast, which is later than that of our ancestors, from the East. The meal called tea is but a part of the dinner and supper, as a regular meal, has nearly disappeared. A light meal, called luncheon, is often taken between breakfast and dinner. Our dinner has therefore come nearly to correspond with the custom of our ancestors. This change of hours has brought with it one important change to the social habits; the excessive drinking, so common during the Georgian era, even among the refined, has disappeared; the long dinner of that period have been abridged to an hour, half an hour, spent over wine after dinner. In the East, dinner is, more than anywhere else, a social meal, and an occasion of meeting friends; and public dinners, with toasts and speeches, are a characteristically British custom. In Germany, the usage still obtains, to the extent, of an early dinner and a supper. In the West, a usual dinner-hour, and even the supper has hardly advanced beyond three and four. In Vienna, and some other parts of Germany, it is not uncommon to have five meals a day, breakfast, luncheon, dinner, tea, and supper.

See BREAD.

MEAL-WORM, the larva of *Tenebrio molitor*, a

*Tenebrio Molitor* :

1, perfect insect; 3, pupa; 4, larva (meal-worm).

This insect of a genus allied to *Blaps* (q. v.), has long wings and wing-covers. The perfect insect is of a pitchy or dark chestnut colour, smooth,

about half an inch long, with short 11-jointed antennae, and stout legs. It is a common insect in Britain, most active in the evening, abounding in granaries, mills, and houses in which considerable stores of meal or flour are kept; as its eggs are deposited among these substances, on which the larva feeds, often doing considerable injury. Stores of ship-biscuit often suffer from this cause. The larva is about an inch long, thin and round, of an ochreous colour, with bright rusty bands, very smooth and glossy, with six small feet, and two very short antennae.—Another species, *T. obscurus*, has been introduced with American flour, and has become pretty common in some parts of Britain. The insect is of a dull black colour above; the under parts, legs, and antennae, chestnut. The larva is shining and pale brown.—Cleanliness and care are the best preventives of these pests. Meal-worms are a favourite and excellent food of caged nightingales.

MEALY BUG (*Coccus adonidum*), an insect naturalised in our hothouses, and very injurious to pine-apples and other plants. It is reddish, and covered with a white powdery substance. See COCCUS.

MEAN, in Mathematics, is a term interpolated between two terms of a series, and consequently intermediate in magnitude. The *Geometric Mean* (q. v.) of two numbers is always less than their *Arithmetic Mean* (q. v.), and greater than their *Harmonic Mean*; and the geometric mean is itself a geometric mean between the two other 'means.'

MEARNS. See KINCARDINESHIRE.

MEASLES (known also as RUBEOLA and MORBILLI) is one of the group of blood-diseases termed *Exanthemata* (q. v.), although, from the eruption which appears on the surface of the body, it is sometimes classed with the skin-diseases. It is communicable from person to person, and seldom occurs more than once in the same individual. Its period of incubation—that is to say, the time that elapses between exposure to the contagion and the first appearance of the febrile symptoms which precede the eruption—is usually about a fortnight; then come lassitude and shivering, which are soon followed by heat of skin, increased rapidity of the pulse, loss of appetite, and thirst. The respiratory mucous membrane is also affected, and the symptoms are very much the same as those of a severe cold in the head, accompanied with a dry cough, a slight sore throat, and sometimes tightness of the chest.

The eruption which is characteristic of the disease usually appears upon the fourth day from the commencement of the febrile symptoms and the catarrh—seldom earlier, but not unfrequently some days later. It is a rash, consisting at first of minute red papulae, which, as they multiply, coalesce into crescentic patches. It is two or three days in coming out, beginning on the face and neck, and gradually travelling downwards. The rash fades in the same order as it occurs; and as it begins to decline three days after its appearance, its whole duration is about a week. The red colour gives way to a somewhat yellowish tint, and the cuticle crumbles away in a fine bran-like powder; the process being often attended with considerable itching.

There are two important points in which it differs from Smallpox (q. v.), with which in its early stage it may be confounded: these are—1. That the fever does not cease or even abate when the eruption appears, but sometimes increases in intensity; and (2), that the disease is not more severe or more dangerous because the eruption is plentiful or early. The character of the eruption, after the first day, will serve to remove all doubt regarding these two

## MEASURE—MECCA.

diseases; and the comparative prevalence of either disease in the neighbourhood will materially assist in forming the diagnosis. It is distinguished from Scarlet Fever (q. v.) or scarlatina, (1), by the presence at the outset of catarrhal symptoms, which do not occur in the latter disease, at any rate, prior to the eruption; (2), by the absence of the throat-affection, which always accompanies well-marked cases of scarlet fever; (3), by the character of the rash, which in measles is said to present somewhat the tint of the raspberry, and in scarlet fever, that of a boiled lobster; which in measles appears in crescentic patches, and in scarlet fever is universally diffused; which in measles usually appears on the fourth day, and in scarlet fever on the second day of the disease.

In ordinary uncomplicated measles, the prognosis is almost always favourable. The chief danger is from inflammation of some of the textures that compose the lungs; and in scrofulous children, it often leaves chronic pulmonary mischief behind it. No age is exempt from the disease, but it is much more common in childhood than subsequently. The reason probably is that most persons have it in early life, and are thus protected from an attack at a later period.

In mild forms of the disease, nothing more is requisite than to keep the patient on a low diet, attend to the state of the bowels, and prevent exposure to cold, which is best accomplished by keeping him in bed with the ordinary warmth to which he is accustomed in health. If the chest-symptoms become urgent, they must be treated according to their nature. Bronchitis (q. v.), sometimes extending into Pneumonia (q. v.), is most to be feared. If the eruption disappear prematurely, it may sometimes be brought back by placing the patient in a warm bath. In such cases, stimulants are often required, but must, of course, only be given by the advice of the physician. The patient must be carefully protected from exposure to cold for a week or two after the disease has apparently disappeared, as the lungs and mucous coat of the bowels are for some time very susceptible to inflammatory attacks.

MEASURE, in Music, is a term applied to the quantity of notes which are placed in the bar, and which is generally called the *time*, of which there are but two kinds, viz., common time, containing an equal quantity of notes in the bar, and triple time, containing an unequal quantity. Common time is generally marked with a C at the beginning, which means that every bar contains four crotchets, or their value in other notes. There are also other kinds of common time, which are marked  $\frac{3}{4}$ ,  $\frac{2}{4}$ ,  $\frac{6}{8}$ . Triple time is marked  $\frac{3}{8}$ ,  $\frac{3}{4}$ ,  $\frac{3}{2}$ ,  $\frac{3}{4}$ . Sometimes, in common time, we have  $\frac{1}{2}$ ,  $\frac{1}{4}$ . The lower figure indicates the parts of the semibreve, and the upper figure shews how many of these parts there are in the bar.

MEATH, a maritime county of the province of Leinster, Ireland, bounded on the east by the Irish Sea and the county of Dublin; area, 906 square miles, or 580,083 acres, of which 547,391 are arable, 16,033 are uncultivated. Pop. (1851) 140,748; (1861) 110,575; (1871) 94,480, of whom 88,129 are Roman Catholics, 5849 Protestant Episcopalians, the rest Protestants of other denominations. The surface is for the most part an undulating level, forming the eastern extremity of the great limestone plain of Ireland, and rising slightly towards the north and north-west. No minerals of any importance are found. The soil is a rich loam, and extremely fertile; but it has long been devoted almost entirely to pasture; the total extent under cereal crops in 1872 being only 155,226 acres. In the same year, the cattle amounted to 161,504, the sheep to 220,907,

and the pigs to 18,346. The chief rivers are the Boyne and Blackwater. The principal towns are Trim, Navan, and Kells, in the first of which the assizes are held. M. possesses abundant means of internal communication, being intersected by numerous roads and several railways, as also by the Royal Canal. The coast-line is about 10 miles, but without any port of importance, even as a fishing station. The occupations of the people are almost exclusively agricultural. The schools in 1872 numbered 187, with 16,612 pupils. Anciently, M., which included West Meath, and probably portions of several other adjacent counties, constituted one of the kingdoms into which Ireland was divided, the royal seat being the celebrated Temor or 'Tara of the Kings,' the scene of the first preaching of Christianity under St Patrick. After the English invasion, M. was early occupied by Strongbow, and was erected into a county palatine by Henry II., who conferred it on Hugh de Lacy. From this time forward, it was the scene of many conflicts. In the end of the reign of Henry VIII., it was separated into East and West Meath. Few Irish counties present so many interesting relics of Irish antiquities of all the various periods. Celtic remains abound along the Boyne and Blackwater. The earthworks of the ancient royal seat at Tara are still discernible, and some valuable and highly characteristic old ornaments were there discovered. John's castle at Trim is one of the most extensive monuments of English rule in Ireland. The round tower and sculptured crosses of Kells are singularly interesting, and almost every parish in the county contains some relic of the feudal or ecclesiastical structures which formerly covered the land. M. returns two members to parliament.

MEAUX, a town of France, in the department of Seine-et-Marne, on the river Marne, 25 miles east-north-east of Paris. It is a bishop's see, and its cathedral, begun in the 11th c., is a noble Gothic structure. Bossuet, the famous preacher, was bishop here, and is buried in the choir. Corn and flour from the water-mills on the Marne are sent to Paris in large quantities, and there are manufactures of cotton and other cloths, pottery, leather, salt-petre, &c. Pop. 10,000.

ME'CCA (*Om Al Kora*, Mother of Cities), one of the oldest towns of Arabia, the capital of the province of Hedjaz, and, through being the birthplace of Mohammed, the central and most holy city of all Islam. It is situated in 21° 30' N. lat., and 40° 8' E. long., 245 miles south of Medina, and about 65 miles east of Jiddah, the well-known port on the Red Sea, in a narrow, barren valley, surrounded by bare hills and sandy plains, and watered by the brook Wadi-Al-Tarafeyn. The city is about 1500 paces long, and about 650 broad, and is divided into the Upper and Lower City, with about 25 chief quarters. The streets are broad and rather regular, but unpaved; excessively dusty in summer, and muddy in the rainy season. The houses, three or four stories high, are built of brick or stone, ornamented with paintings, and their windows open on the streets. The rooms are much more handsomely furnished, and altogether in a better state than is usual in the East; the inhabitants of M. making their living chiefly by letting them to the pilgrims (see HAJJ) who flock hither to visit the Beit Ullah (House of God), or chief mosque, containing the Kaaba (q. v.). This mosque, capable of holding about 35,000 persons, is surrounded by 19 gates surmounted by seven minarets, and contains several rows of pillars, about 20 feet high, and about 15 inches in diameter, of marble, granite, porphyry, and common sandstone, which at certain distances

are surmounted by small domes. A great number of people are attached to the mosque in some kind of ecclesiastical capacity, as *katibs*, *muftis*, *mueddins*, &c. No other public place or building, sacred or profane, of any importance, is to be found in this city, which also is singularly destitute of trees and verdure of any kind. It is protected by three castellated buildings, and is governed by a *sherif*. The population has, in consequence of the rapidly decreasing number of pilgrims, fallen off considerably of late, from above 100,000 to hardly 40,000, who do not find the 100,000 annual pilgrims sufficient to keep them in the state of prosperity of former years. The trade and commerce of M. hardly deserve mention; the chief articles manufactured there are chaplets for the pious pilgrims. The townspeople themselves are lively, polished, and frivolous, and growing up amid an immense concourse of strangers from all parts of Asia, are generally able to converse in three or four eastern languages. Respecting the history of M., it was known to Ptolemy already as *Macoraba*, and first belonged to the tribe of the *Kosaites*, later to the *Korish*. Mohammed, who had been obliged to leave it precipitately (see *HEDJRAH*) in 622, returned to it and conquered it in 627. Within the course of the present century, M. was taken by the *Wahabites* (1803), but given up again to the *Pasha* of Egypt, *Mehemed Ali* (1833) whose son, *Ibrahim*, was made *Sheik El Haram*—‘of the Sacred Place.’ At present, however, M. is directly dependent on the sultan.—A certain balm, called *Balm of Mecca*, is made from a plant which grows in abundance in the neighbourhood of the city, called *Besem*.

#### MECHANICAL POWERS—MACHINES.

Machines are instruments interposed between the moving power and the resistance, with a view of changing the direction of the force, or otherwise modifying it. Machines are of various degrees of complexity; but the simple parts, or elements of which they are all composed, are reducible to a very few. These elementary machines are called the *MECHANICAL POWERS*, and are usually reckoned as six in number, three being primary—viz., the *lever*, *inclined plane*, and *pulley*; and three secondary, or derived from the others—viz., the *wheel-and-axle* (derived from the lever), the *wedge*, and the *screw* (both derived from the inclined plane). To these some add toothed-wheels. What is special to each machine, will be found under its name; a few observations applicable to all may appropriately be made here. 1. In treating of the theory of the lever and other mechanical powers, the question really examined is, not what power is necessary to move a certain weight, but what power is necessary to balance it; what force at P, for instance (see *LEVER*, fig. 1), will just keep W suspended. This once done, it is obvious that the least additional force to P will suffice to begin motion. 2. In pure theoretical mechanics, it is assumed that the machines are without weight. A lever, for instance, is supposed to be a mere rigid line; it is also supposed to be perfectly rigid, not bending or altering its form under any pressure. The motion of the machine is also supposed to be without friction. In practical mechanics, the weight of the machine, the yielding of its parts, and the resistance of friction, have to be taken into account. 3. When the effect of a machine is to make a force overcome a resistance greater than itself, it is said to give a *mechanical advantage*. A machine, however, never actually increases power—for that would be to create work or energy, a thing now known to be as impossible as to create matter. What is gained in one way by a machine is always lost in another. One pound at the long end of a lever will lift ten pounds at

the short end, if the arms are rightly proportioned; but to lift the ten pounds through one foot, it must descend ten feet. The two weights, when thus in motion, have equal momenta; the moving mass multiplied into its velocity, is equal to the resisting mass multiplied into its velocity. When the lever seems to multiply force, it only concentrates or accumulates the exertions of the force. The descending one-pound weight, in the case above supposed, may be conceived as making ten distinct exertions of its force, each through a space of a foot; and all these are concentrated in the raising of the ten-pound weight through one foot. The principle thus illustrated in the case of the lever holds good of all the other mechanical powers. 4. The object of a machine is not always to increase force or pressure; it is as often to gain velocity at the expense of force. See *LEVER*. In a spinning-factory, e.g., the object of the train of machinery is to distribute the slowly working force of a powerful water-wheel, or other prime mover, among a multitude of terminal parts moving rapidly, but having little resistance to overcome. 5. The mechanical advantage of a compound machine is theoretically equal to the product of the separate mechanical advantages of the simple machines composing it; but in applying machines to do work, allowance must be made for the inertia of the materials composing them, the flexure of parts subjected to strains, and the friction which increases rapidly with the complexity of the parts; and these considerations make it desirable that a machine should consist of as few parts as are consistent with the work it has to do. 6. The forces or ‘Moving Powers’ by which machines are driven, are the muscular strength of men and animals, wind, water, electrical and magnetic attractions, steam, &c.; and the grand object in the construction of machines is, how, with a given amount of impelling power, to get the greatest amount of work of the kind required. See *WORK*, *FOOT-POUND*. This gives rise to a multitude of problems, some more or less general, others relating more especially to particular cases—problems, the investigation of which constitutes the science of Applied Mechanics. One of the questions of most general application is the following: If the resistance to a machine were gradually reduced to zero, its velocity would be constantly accelerated until it attained a maximum, which would be when the point to which the impelling force is applied was moving at the same rate as the impelling force itself (e.g., the piston-rod of a steam-engine) would move if unresisted. If, on the other hand, the resistance were increased to a certain point, the machine would come to a stand. Now the problem is, between these two extremes to find the rate at which the greatest effect or amount of work is got from the same amount of driving power. The investigation would be out of place here, but the result is, that the greatest effect is produced when the velocity of the point of application is one-third of the maximum velocity above spoken of. The moving force and the resistance should therefore be so adjusted as to produce this velocity.

**MECHANICS** is the science which treats of the nature of forces and of their action on bodies, either directly or by the agency of machinery. The nature of force will be found treated of under *FORCE*. The action of forces on bodies may be in the form of pressure or of impulse, and may or may not produce motion. When the forces are so balanced as to preserve the body affected by them in a state of equilibrium, their actions are investigated in that branch of mechanics called *STATICS* (q.v.); when motion is produced, they are considered under the head of *DYNAMICS* (q.v.), or *Kinetics*. The

# MECHITARISTS—MECKLENBURG-SCHWERIN.

equilibrium and motion of fluids (including liquids and gases) is treated in the subordinate branches of HYDROSTATICS and HYDRODYNAMICS; though the special terms AEROSTATICS and AERODYNAMICS (for which the comprehensive term PNEUMATICS is often used) are sometimes employed to designate those portions of the science of mechanics in which the action of gaseous bodies is treated of.

The science of mechanics owes very little to the ancient philosophers. They were acquainted with the conditions of equilibrium on the lever—discovered by Archimedes—and had reduced the theory of all the mechanical powers, except the pulley and the inclined plane and its derivatives, to that of the lever, but this was nearly all. Archimedes, starting from the principle of equilibrium on the lever, struck out the idea of a centre of gravity for every body, and investigated the position of that point for the triangle, parabola, and paraboloid. Till the 16th c., the science remained stationary, Cardan, the Marquis Ubaldi, and Stevinus—who was the first to give the correct theory of equilibrium on the inclined plane—then gave it a slight impetus, and the labours of Galileo, who introduced the expression of mechanical propositions in mathematical formulas, discovered the laws regulating the motion of falling bodies, and originated investigations concerning the strength of materials, placed the science on a broad and substantial basis. Torricelli, Descartes, Pascal, Fermat, Roberval, and Huyghens, on the continent, and Wallis and Wren in England—the last three of whom simultaneously discovered the laws which regulate the collision of bodies—added each his quota to the *new science*, as mechanics was then called. In 1687, appeared Newton's *Principia*, in which the complete experimental basis of the subject was first laid down in a satisfactory manner, and the mechanical principles which had before been considered to act only at the surface of the earth, were shewn to rule and direct the motions of the planets. Contemporary with Newton were Leibnitz, and the two elder Bernouillis, James and John, who, besides contributing greatly to the advancement of the science, applied to it the newly-invented differential calculus, which was found to be a weapon of immense power. From this time, a constant succession of illustrious men have prosecuted the study of theoretical mechanics, or of subjects connected with it. The chief names are Daniel Bernouilli, Euler, D'Alembert, Clairaut, Lagrange, Laplace. Lagrange's *Mécanique Analytique* not only systematised the subject, but enormously increased its power and the range of its applications. The last great additions to the science are those made by Sir W. R. Hamilton (q. v.) under the name of the principle of *Varying Action*. The developments which this has received from Jacobi, Boole, Cayley, Liouville, Donkin, Bour, &c., form an extensive and difficult branch of applied mathematics, chiefly of the theory of simultaneous differential equations.

**MECHITARISTS**, a congregation of Armenian Christians, who reside on the island of San Lazzaro at Venice, but who have also obtained a footing in France and Austria. They derive their name from MECHITAR (i. e., the Comforter) DA PETRO (born at Sebaste 1676, died at Venice 1749), who, in the year 1701, founded at Constantinople a religious society for the purpose of diffusing a knowledge of the old Armenian language and literature. Subsequently, the M. removed to the Morea, and thence, on the conquest of that portion of Greece by the Turks in 1715, to San Lazzaro, which was granted to them by the Venetian government.—The M. acknowledge the supremacy of the Roman pontiff. Their most useful occupation is printing the classic

writings of Armenian literature; their editions are universally admitted to be the best and most correct. They also issue a *journal*, which is much read throughout the Levant.—Compare Bont, *Le Convent de St-Lazare à Venise, ou Histoire succincte de l'Ordre des Méchitaristes Arméniens* (Paris, 1837).

**ME'CHLIN.** See MALINES.

**ME'CKLENBURG-SCHWERIN**, a grand duchy of Northern Germany, bounded on the N. by the Baltic, E. by Pomerania, S. by Brandenburg, and W. by Lanenburg. The area is about 5136 square miles, and pop. (1872) 537,807. M.-Schwerin is watered by several rivers, the most important of which are the Elbe and the Warnow, and has a great many lakes and ponds, yielding an abundant supply of fish. The country is generally flat, although here and there intersected by low ranges of hills, and its surface is still extensively covered with wood, notwithstanding the great clearings which have been made in the forests during the present century. Near the sea, tracts of sand and morass cover large areas; but on the whole, the soil is of a good quality, and well adapted for the growth of corn, or the rearing of cattle, which constitute the principal native industry. There is considerable commerce through Warnemünde (Rostock) and Wismar; there were in 1870, belonging to the two ports, 428 vessels, with a burden of 57,843 lasts of 6000 lbs. The grand duchy is divided into the circles of Schwerin, Güstrow, Rostock, and Wismar. The capital is Schwerin. The central and south-east districts are the most densely peopled. The people of both the Mecklenburg duchies (Schwerin and Strelitz) are for the most part of Slavonic origin, but amalgamation with their Saxon neighbours has largely Germanised the original race. The predominating form of religion is the Lutheran, Roman Catholic and other churches numbering about 1100, while there are upwards of 3000 Jews. Much has been done of late years in extending the educational organization of both duchies, although the lower classes do not yet enjoy as many advantages as in some other districts of Germany. Besides the university at Rostock (q. v.), there are five gymnasia, and numerous burgher, parochial, and other schools. The troops of M.-Schwerin number in time of peace 2700 men, and when on a war-footing, 5380 men. The principal towns are the capital Schwerin, Ludwigslust, Rostock, Güstrow, and Wismar. The grand-duke, whose powers are limited by a mixed feudal and constitutional form of government, has the title of Royal Highness, and is styled Prince of the Wends, and of Schwerin and Ratzburg, Count of Schwerin, and Lord of Rostock, Stargard, &c. The two Mecklenburg duchies have provincial estates in common, which meet once a year, alternately at Malchin and Sternberg. This united chamber consists of 684 landowners and the representatives of forty-seven provincial boroughs; while the country people have no representation. There is no general budget for M.-S.; there are three entirely distinct systems of finance. The budget of the first system, called the administration of the sovereign, is estimated at about 3 million thalers; the second, the states administration, has but small resources to dispose of: the ordinary budget of the common administration of the sovereign and the states was, for 1873—1874, about 770,000 thalers. The public debt is upwards of 15 million thalers. M.-S. has two votes in the Federal Council, and six representatives in the imperial diet.

*History.*—The Mecklenburg territory, anciently occupied by Germanic, and afterwards by Slavonic tribes, was finally subdued, in the 12th c., by Henry

## MECKLENBURG-STRELITZ—MEDAL.

te of Saxony, who, after thoroughly e country, and compelling the small habitants remaining after the war to unity, restored the greater part of the irewin, the heir of the slain Slavonic and gave him his daughter in marriage. at that period received its present om its principal settlement, Mikilil-llage between Wismar and Brühl. In levated into a duchy by the Emperor ke Johann Albrecht introduced the etrines in 1550, and his grandsons, and Johann Albrecht, founded the lenburg-Schwerin and Mecklenburg- ch were, however, deprived of the 627, in consequence of their adhesion ant cause, when the imperial general as proclaimed duke of all Mecklenburg. tavus Adolphus of Sweden restored the deposed dukes, to their domains. subdivisions of the ducal line into the chwerin, Strelitz, and others, and the unction of several of these collateral mperial Commission, which met at 701, brought about the settlement of pact, by which it was arranged that Güstrow should form one duchy, and Ratzeburg and Stargard, Mirow and ther independent sovereignty. After events of importance occurred till in Schwerin, in 1785, of Friedrich tained the title of grand duke in 1815, 837, after a long reign, which he had onducive to the internal welfare and tation of his hereditary dominions. Friedrich Franz II., who succeeded ul Friedrich, in 1842, was disturbed between the nobles and the burgher landowners, the former arrogating to a exclusive right of electing members strian order, nominating to benefices, ing other prerogatives of the ancient y. The revolutionary excitement of resh stimulus to the popular ferment, rbanes could only be quelled by the f Prussian troops. Both as members German Confederation and of the two duchies have maintained their itution very much on the old footing. NBURG-STRELITZ, a grand duchy composed of two distinct portions of Stargard (by far the larger division, east of Mecklenburg-Schwerin) and y of Ratzeburg (between Mecklenburg-Lauenburg), and comprising an area e than 1000 square miles, with a pop. 82. The country is flat, and similar al characters to Schwerin, although, er distance from the sea, the climate l and less changeable. Strelitz, as ed, has one joint representative cham- werin, but the lordship of Ratzeburg d in these estates, and is governed e grand duke, who possesses very ivate domains, from which he draws t. The grand duke gave Ratzeburg ve constitution in 1869. M.-Strelitz in the Federal Council of the empire, entative in the diet. M.-Strelitz has arly two million thalers. For the Strelitz, see preceding article.

nburg duchies are essentially agricul- ent. of the inhabitants being employed In M.-Schwerin 3549 square miles, ditz 670 square miles, are under culti- cattle of the duchies are considered

the best in Germany; the horses especially are held in high esteem. The principal products are corn (which is exported to Scandinavian and British ports), cattle and sheep (which are sent to the markets of Hamburg and Berlin), wool, tobacco, butter, cheese, fish, fruit, hides, &c. The matricu- lar contribution of both duchies towards imperial expenditure amounted in 1871 to 356,227 thalers, the share of M.-Strelitz being 53,714.

**MECONIC ACID** ( $C_{14}H_{10}O_8 \cdot 3H_2O + 6Aq$ ), (from Gr. *mēcon*, a poppy), an acid existing in opium, which, when good, yields from 6 to 8 per cent. of it. Both the acid and its salts assume a characteristic blood- red tint with persalts of iron, and this test, which is very sensitive, is employed by the toxicologist in searching for traces of opium. As, however, the alkaline sulphocyanides which exist normally in the saliva give a precisely similar tint with the persalts of iron, it is necessary to be able to distinguish the meconate of iron from the sulphocyanide of iron. A solution of terchloride of gold or of corrosive sublimate removes all doubt, by discharging the colour of the sulphocyanide, but not affecting the colour of the meconate of iron.

**MECONIUM.** This term is applied to the earliest matter discharged from the bowels of a new-born infant. It is of a brownish-green or almost black colour, acid to test-paper, but devoid of odour, and rapidly putrefying on exposure to air. It is usually regarded as a product of the foetal liver, but, according to Lehmann, it contains neither biliary acids nor bile-pigment. When examined under the microscope, it is found to consist of an abundance of cylinder epithelium of a beautiful green tint, of mucus-corpuscles, and of fat, with which there is a good deal of cholesterine.

**MEDAL** (Fr. *medaille*, Lat. *metallum*), a piece of metal in the form of a coin, not issued or circu- lated as money, but stamped with a figure or device to preserve the portrait of some eminent person, or the memory of some illustrious action or event. The study of medals, interesting in an historical and antiquarian point of view, is also important as illustrating the contemporary state of art. Like coins, medals belong to two periods, ancient and modern, separated by a wide interval. To the former belong those pieces issuing from the mint of ancient Rome, known as *medallions*, of the size of the aureus in gold, of the denarius in silver, and of the first or large brass in copper. They are generally supposed to have been struck on occasions similar to those on which medals are coined in modern times, on the accession of an emperor, on the achievement of an important victory, or as specimens of workmanship; but there are circumstances which countenance the belief that they were circulated as money. Medallions prior to the time of Hadrian are rare and of great value—one of the most beau- tiful and most famous being a gold medallion of Augustus Caesar—from Hadrian to the close of the Empire they are comparatively common. Of the Roman medallions, some were struck by order of the emperors, some by the senate; the latter may be known by being inscribed with the letters S. C. The larger bronze medallions are of admirable workmanship. In some of them, a ring of bronze surrounds a centre of copper, and the inscrip- tion extends over both metals. No portrait of a person not princely occurs on any ancient medal, a remarkable circumstance, considering the numer- ous contemporary statues of poets, historians, and philosophers. The *Contornii* are bronze medals marked with furrows (*contorni*), distributed at the public games, and apparently also in use as money. Numerous medals and medallions were struck in the

Greek provinces of the Roman empire, of less substance and thickness, for the most part, than those of Rome. The Sicilian medals are of very fine workmanship, particularly one with a head of Ceres, and on the reverse a Victory crowning a figure in a car.

Modern medals begin in the 14th c., but few were struck prior to the 15th. Portraits of non-princely persons are freely introduced after the 16th century. An affectation of the classical takes from their value as illustrations of contemporary life. Most European countries possess a succession of medals from the 15th c. onwards. The best in point of design of the 15th c. medals are those wrought by Victor Pisani of Verona, and inscribed 'Opus Pisani Pictoria.' The medals of the popes form an unbroken series from the time of Paul II., who filled the papal chair from 1464 to 1471. Those that purport to be of earlier popes are all known to be, in point of fact, of later date. The reverse generally bears the cross-keys and mitre, and the obverse the head of the reigning pope. Some of the medals of Julius II., Leo X., and Clement VII. have an especial value, as having been designed by Raphael and Giulio Romano, and engraved by Benvenuto Cellini. A 16th c. medal of Sicily is probably the first instance in modern times of the use of a medal as a vehicle of political satire; it is directed by Frederick II. against his adversary, Ferdinand of Spain, whose head is on the obverse, with the inscription, 'Ferdinandus R. R. Vetus Vulpes Orbis'; and on the reverse a wolf carrying off a sheep, with 'Jugum meum suave est et opus meum leve.' Satirical medals were afterwards common in the Low Countries. A medal representing Van Heubingen, the Dutch ambassador, in the character of Joshua arresting the course of the sun, is said to have so exasperated Louis XIV., who was understood to be typified by that luminary, as to cause the whole hostile force of France to be brought against Holland. Some of the Dutch medals are noted for the elaborate views, maps, and plans engraved on them. France produced few medals prior to the time of Louis XIV.; but there is a series illustrative of the chief events in the life of the Grand Monarque, and another devoted to the career of the First Napoleon. The Spanish medals begin with Gonsalvo about 1500. Scotland produced one of the earliest of modern medals, struck by David II., perhaps during his captivity in England, and formed on the model of the nobles of Edward III. English medals only begin with Henry VIII., and from Edward VI. onwards, there is an unbroken succession of coronation medals. The Scottish gold coronation medal of Charles I. is the first medal struck in Britain with a legend on the edge. The medals of the Commonwealth and Charles II. are by Simon; those of Queen Anne record the achievements of Marlborough. Medals, in connection with NUMISMATICS (q. v.), are treated of by the various writers on that subject.

Medals in the present day are conferred by the sovereign as marks of distinction for eminent worth or noble conduct, more particularly for naval and military services. Such medals of honour are seldom of great intrinsic value, their worth depending merely on the associations connected with them. They have ribbons attached, with clasps or small bars, each of which bears the name of a particular action. The Waterloo medal is of silver, with the head of George IV. (Prince Regent), a winged Victory, and the words 'Waterloo,' 'Wellington'; it hangs from a crimson ribbon, with a narrow stripe of blue near each edge. The Crimean medal, also of silver, is attached to a blue ribbon with yellow edges when worn for service in the Crimea, and to a yellow ribbon with blue edges when for service in the Baltic. Good-service medals of silver were

instituted in 1830 and 1831, and rules formed for their distribution among meritorious sailors, soldiers, and marines. The naval medal is worn suspended from a blue, and the military from a crimson ribbon. There are also various British medals which have been conferred for services in the Peninsula, India, &c. On every medal is engraved the name, rank, &c., regiment or ship of the recipient of it. Medals and decorations do not seem to have been ever conferred as rewards in the army or navy prior to the Commonwealth. The French military medal and the Sardinian war-medal have lately been bestowed to a large extent on British officers, soldiers, seamen, and marines. The former exhibits the effigy of Napoleon III., surmounted by an eagle, and is worn from a yellow ribbon with green borders; the latter is charged with the cross of Savoy, and suspended from a sky-blue ribbon. No medal of honour from any foreign sovereign is allowed to be worn or accepted by any British subject without the sanction of the Queen.

**MEDALLION** (in Architecture), a circular panel containing a bas-relief of a head, bust, figure, &c.

**MEDEA**, in Grecian legend, a famous sorceress, the daughter of Aëtes, king of Colchis, and of the Oceanid Idyia, or of Hecate. She married Jason, the leader of the Argonauts (q. v.), and aided him in obtaining the Golden Fleece. Jason, after his return home, being desirous to be revenged on Pelias for the murder of his parents and his brother, M. persuaded the daughter of Pelias to cut him in pieces and boil him, in order to make him young again. Jason and she fled to Corinth, where, after she had been his wife for ten years, he repudiated her, to marry Glauce or Creusa, and M., in revenge, sent by her son to her rival a poisoned robe or diadem, the virulence of which destroyed both her and her father. M. then slew the children which she had born to Jason, and fled to Athens in a chariot drawn by dragons, which she obtained from Helios. There she was received by Ægeus, to whom she bore Medos; but afterwards being compelled to flee from Athens, she took Melas to Aria, the inhabitants of which were thenceforth called Medes. She finally became immortal, and the spouse of Achilles in the Elysian Fields. Such is the classic legend, which afforded material for many productions of the tragic muse, and subjects for the painter and sculptor, and which even in modern times has been so employed.

**MEDELLIN**, a city of the Granadian Confederation, South America, in the province of Antioquia, and 50 miles south-east of the city of that name, between the ranges of the Central and Western Cordilleras. It is a beautiful town, and, placed at an elevation of about 5000 feet above sea-level, its climate is exceedingly pleasant. It is the entrepôt of trade for the surrounding district, and contains a population estimated at 15,000.

**MEDIA**, in ancient times, the name of the north-western part of Iran, which was bounded by the Caspian Sea on the N., by Persia on the S., by Parthia on the E., and by Assyria on the W. The northern portion of the country is very mountainous; the south is a rich and fertile tract. M. at present forms the Persian provinces of Azerbaijan, Ghilan, Mazanderan, and Irak-Ajemi, and the northern portion of Luristan. The Medians were in language, religion, and manners very nearly allied to the Persians. After they had shaken off the yoke of the Assyrians, their tribes united about 708 B. C., according to the common account, chose Dejoces (Kai-Kobad) for their chief, and made Ecbatana their capital. His son Phraortes, or Arphaxad, subdued the Persians. Cyaxares (Kai-

## MEDIATE—MEDICAL SCHOOL.

ous), the son of Phraortes, in alliance with Nabonassar, king of Babylon, overthrew the Assyrian king about 604 B.C., spread the terror of his name as far as Egypt and the furthest bounds of a Minor, and vanquished the brigand hordes Scythia, who had carried their ravages as far as Syria. He was succeeded by his son Astyages (Achak), who was deposed (560 B.C.) by his own grandson Cyrus (Kai-Khūsru), king of Persia; and in this time the two nations are spoken of as one people. Ecbatana, the capital of M., became the summer residence of the Persian kings. After the death of Alexander the Great (324 B.C.), the northern portion (*Atropatene*) of M. became a separate kingdom, and existed till the time of Augustus; the southern portion, under the name of *Great M.*, forming part of the Syrian monarchy. M. was on several occasions separated from Persia. In 152 B.C., Mithridates I. took Great M. from the Syrians, and added it to the Parthian empire, and about 36 B.C. it had a king of its own, named Artavasdes, against whom Mark Antony made war. Under the Sassanian dynasty, the whole of M. was united to Persia. It became, during the 14th and 15th centuries, the stronghold of the Turkoman tribes the *Black Sheep*, and *Ak-Koinlu*, or *White Sheep*.

In early times, the Medes were a warlike race, famed for an enthusiastic love of independence, distinguished for their skill with the bow. They were also celebrated for their horsemanship, and it was from them that the Persians adopted this and their favourite exercises and acquirements. In subsequent times, they appear to have become effeminated by luxury. (See the works of Xenophon, Herodotus, and Ammianus.)

**MEDIATE**, in the old German empire, a term applied to those lordships or possessions which were held by feudal tenure under one of the greater vassals, and so only *mediately* under the emperor as the same feudal lord. Many of the smaller states or lordships were gradually reduced to this condition as the neighbouring greater states increased in power; and amidst the changes caused by the wars of the French Revolution in 1803 and 1806, many small states were thus *mediatised*, in which the larger states found a sort of compensation for their losses in other quarters. The term continued to be employed even when the feudal sovereignty of the German empire did not exist. At the Congress of Vienna, further *mediatisations* were effected; and at the present day the people of many of the smaller ruling states are anxious for a similar change. The question of *mediatisation* was one of those affecting the internal welfare of Germany which was most keenly agitated in 1848.

**MEDIATOR**, a term applicable to any person who endeavours to reconcile parties at variance. In theology, it is employed to denote Jesus Christ, both with respect to his sacrifice of *Atonement* (q.v.)—king God and man as *one* again, by satisfying the justice, which otherwise demands the punishment of sinners—and with respect to his continual intercession (q.v.). The Roman Catholic Church represents *saints* as mediators of intercession, though not of atonement; but this view is rejected by Protestants.

**MEDICAL DEPARTMENT** of an Army, next to the commissariat, is the most important of all non-combatant sections. The surgical treatment of the wounded in actual fighting, and still more in combat with disease engendered by crowding, unhealthy stations, and the reckless habits of the soldiery, necessitate a large medical staff; for, on an average of the whole army, it is found that the

rate of sickness is at least triple that for the civil population.

In the British army, every battalion, when at home or in the temperate zone, has a surgeon and an assistant-surgeon; when in India or the tropics, another assistant-surgeon is added. In addition to these officers, there are numerous staff medical officers at all stations, who have charge of detachments, hospitals, &c. The active list of the medical officers comprises (1874) about 591 surgeons-general, deputy surgeons-general, surgeons-major, and surgeons. Besides these, there are between 400 and 500 medical officers employed with the army in India. The cost of the former to the British treasury is about £167,000 per annum.

The medical department is governed by a director-general, who is a member of the War Office, and has charge of the surgical, medical, and sanitary arrangements of the army. The special duties, pay, &c., of the several ranks, will be found under **SURGEON**.

**MEDICAL DEPARTMENT**, in the Navy, is only of less importance than the same department in the army, in that the sea-service is vastly more healthy than service upon land. After an action, the surgeon, of course, is in equal requisition in either case. In the British navy, the medical officers in active employ, in 1874, comprised 2 inspectors-general, 11 deputy-inspectors-general, 59 staff-surgeons, 86 surgeons, and 226 assistant-surgeons. The pay of these officers varies from £2, 10s. a day for a senior inspector-general of hospitals and fleets, to 11s. a day for a junior assistant-surgeon.

**MEDICAL PRACTITIONERS**, in point of law, have lately been put on a new footing in many respects. The late statute (21 and 22 Vict. c. 90), and later ones, gave the body of medical practitioners powers of self-government, so far as regards qualification and training. All duly qualified persons are now registered, and the register is published, though it is not in strict law compulsory on practitioners to register themselves, the only disadvantage being that those who are not registered cannot fill certain offices, and cannot sue for their fees. Before the late acts, physicians were on the same footing as barristers, and could not sue for their fees, these being considered an honorarium which ought to be paid beforehand, and, at all events, were not a legal debt. But the act remedies this defect as regards qualified registered practitioners. Another enactment of the recent statute, which was intended to put down quacks, but which is still found to be capable of evasion to some extent, was the giving of power to justices of the peace to punish with fine of £20 or imprisonment those who falsely pretend to be, or take, or use the name or title of a physician, doctor of medicine, licentiate in medicine or surgery, bachelor of medicine, surgeon, general practitioner or apothecary.

**MEDICAL SCHOOL**, NETLEY, an establishment for the technical education of medical officers for the British and Indian military service. Candidates are examined competitively in the ordinary subjects of professional knowledge; and, passing satisfactorily through that ordeal, are then required to attend, for six months, at the Military Medical School, where they go through practical courses of military hygiene, military and clinical-military surgery and medicine, and pathology with morbid anatomy. As the school is attached to the Royal Victoria Hospital, which is the great invalid dépôt for the whole army, the students have ample opportunity of seeing theory exemplified in practice. The school comprises four professors, with £850 a year each, 4 assistant-professors having £450 each, and

usually about 40 medical candidates, who receive each 5s. a day and lodging-money. The annual cost of the whole establishment is about £7900.

MEDICI, THE, who ranked among the first and most distinguished families of the Florentine republic, owe their earliest distinction to the success with which they had pursued various branches of commerce, and the liberal spirit in which they devoted their wealth to purposes of general utility. From the beginning of the 13th c., the M. took part in all the leading events of the republic; and from the period when Salvstro dei Medici attained the rank of gonfaloniere in 1378, the family rose rapidly to pre-eminence, although the almost regal greatness which it enjoyed for several centuries is more especially due to Giovanni dei Medici, who died in 1429, leaving to his sons, Cosmo and Lorenzo, a heritage of wealth and honours hitherto unparalleled in the republic. With Cosmo (born 1389, died 1464), on whom was gratefully bestowed the honoured title of 'Father of his country,' began the glorious epoch of the M.; while from Lorenzo is descended the collateral branch of the family, which, in the 16th c., obtained absolute rule over Tuscany. Cosmo's life, except during a short period, when the Albizzi and other rival families re-established a successful opposition against the policy and credit of the M., was one uninterrupted course of prosperity; at once a munificent patron and a successful cultivator of art and literature, he did more than any sovereign in Europe to revive the study of the ancient classics, and to foster a taste for mental culture. He assembled around him learned men of every nation, and gave liberal support to numerous Greek scholars, whom the subjection of Constantinople by the Turks had driven into exile; and by his foundation of an academy for the study of the philosophy of Plato, and of a library of Greek, Latin, and Oriental MSS., he inaugurated a new era in modern learning and art. But although these merits must be conceded to him, it must not be forgotten that while he retained the name of a republican form of government, and nominally confided the executive authority to a gonfaloniere and eight priori or senators, he totally extinguished the freedom of Florence. His grandson, Lorenzo the Magnificent (born 1st January 1448, died 8th April 1492), who succeeded to undivided and absolute power in the state, after the murder of his brother Giuliano in 1478, pursued, with signal success, the policy of his family, which may be characterised as tending to ennoble individuals and debase the nation at large. He encouraged literature and the arts, employed learned men to collect choice books and antiquities for him from every part of the known world, established printing-presses in his dominions as soon as the art was invented, founded academies for the study of classical learning, and filled his gardens with collections of the remains of ancient art; but when his munificence and conciliatory manners had gained for him the affection of the higher and the devotion of the lower classes, he lost no time in breaking down the forms of constitutional independence that he and his predecessors had hitherto suffered to exist. Some few Florentines, alarmed at the progress of the voluptuous refinement which was smothering every spark of personal independence, tried to stem the current of corruption by an ascetic severity of morals, which gained for them the name of *piagnoni*, or weepers. Foremost among them was the Dominican friar Girolamo Savonarola (q. v.), whose eloquent appeals to the people in favour of a popular and democratic form of government, threatened for a time the overthrow of the M.; but the jealousy of the Franciscans, and the vindictiveness of the papal

court, averted their doom. Savonarola's martyrdom restored outward tranquillity to Florence, and left the M. in undisturbed possession of absolute power. Pietro (born 1471), who succeeded his father Lorenzo in 1492, possessed neither capacity nor prudence, and in the troubles which the ambition of his princes and the profligacy of her popes brought upon Italy, by plunging her into civil and foreign war, he shewed himself treacherous and vacillating alike to friends and foes. Lodovico Sforza, named the 'Moor,' relying on the friendship which from the middle of the 15th c., had prevailed between the Sforza family of Milan and the M., applied to him for assistance in establishing his claim to the duchy of Milan; but seeing that a reliance could be placed on Pietro, he threw himself into the arms of Charles VIII. of France. The result was the invasion of Italy by a French army of 32,000 men. Pietro, in hopes of conciliating the powerful invader, hastened to meet the troops on their entrance into the dominions of Florence, and surrendered to Charles the fortresses of Leghorn and Pisa, which constituted the keys of the republic. The magistrates and people, incensed at his perfidy, drove him from the city, and formally deposed the family of the M. from all participation in power. Pietro, who was slain in 1503, while fighting in the French ranks, and several of his kinsmen, made ineffectual attempts to recover their dominions, which were not restored till 1512. The elevation of Giovanni de' Medici to the papal chair, under the title of Leo X., completed the restoration of the family to their former splendour, while the accession, in 1523, of his cousin Giulio Medici to the pontificate as Clement VII., and the marriage of Catharine, the granddaughter of Pietro, to Henry II. of France, and her long rule over that country as regent for her sons, together with the military power of the cadet branch (descended from a younger brother of the 'Father of his country'), threw a weight of power into the hands of the M., which rendered all attempts to maintain even a show of independence futile on the part of the Florentines. The faintest indication of republican spirit was at once crushed by the combined aid of the pope and Charles V.; and though the legitimate male line of Cosmo was extinct (with the exception of Pope Clement VII.), the latter gave, in 1529, to Alessandro, natural son of the last prince Lorenzo II., the rank of Duke of Florence; and on his death, by assassination, without direct heirs, in 1562, raised Cosmo I., the descendant of a collateral branch, to the ducal chair. Cosmo, known as the Great, possessed the astuteness of character, the love of elegance, and taste for literature, but not the frank and generous spirit that had distinguished his great ancestors; and while he founded the academies of painting and of fine arts, made collections of paintings and statuary, published magnificent editions of his own works and those of others, and encouraged trade, for the protection of which he instituted the ecclesiastical order of St Stephen, he was implacable in his enmity, and scrupled not utterly to extirpate the race of the Strozzi, the hereditary foes of his House. His acquisition of Siena gained for him the title of Grand Duke of Tuscany from Pius V.; and he died in 1574, leaving enormous wealth and regal power to his descendants, who, throughout the next half century, maintained the literary and artistic fame of their family. In the 17th c., the race rapidly degenerated; and after several of its representatives had suffered themselves to be made the mere tools of Spanish and Austrian ambition, the last male representative of the line, Giovanni Gaston

d in 1737, and his only sister the Electress Palatine, the last of the M. family, expired in 1743. In accordance with a stipulation of the Peace of Vienna, the grand duchy of Tuscany passed to the House of France.

**MEDICINA**, a town of Italy, in the province of Bologna, 13 miles east of the city of that name. p. 10,000. It is a thriving place, with considerable trade and large markets. It has five churches and theatre, and is surrounded by walls. It occupies the site of the ancient city *Claterna*, of which some remains are still visible.

**MEDICINAL PLANTS.** Those plants of which the part or product is used in medicine, are very numerous, and belong to the most widely different orders. In some orders, particular properties are valent; other medicinal species are exceptional to their properties in the orders to which they belong. Important properties and products are sometimes characteristic of a particular very limited group of species, as in the case of the *Cinchona*s. Many medicinal plants are merely used by the people of the countries in which they grow, others—known as *officinal plants*—have a place accorded them in pharmacopœias and in the practice of educated medical practitioners. Many plants, however, are in high repute among the native physicians of India, which have not yet found a place in any European pharmacopœia, although a few of the most valuable have recently been introduced to notice in Europe. Of the plants which have been rejected from the pharmacopœias, but retain their place in the practice, some are really useful, and would be held in greater esteem if there were not preferable medicines of similar quality; others have owed their reputation merely to ridiculous fancies. Some medicinal plants are always gathered where they grow wild, others are cultivated in order to have them in sufficient abundance. This branch of gardening is carried on to a greater extent at Mitcham, near London, than in any other part of Britain. A boon has very recently been conferred on mankind—so recently that it has scarcely yet begun to be enjoyed—in the introduction of *Cinchona* (v.) trees into India, Ceylon, and Java, where their cultivation has been commenced with every prospect of success, a continued supply of Peruvian bark and of Quinine, their increased abundance, and a diminution of their price, being thus secured. Among the most valuable books on medicinal plants are Hayne's *Getreue Darstellung und Beschreibung der in Arzneikunde gebräuchlichen Kräuter* (4 vols. Berlin, 1805–1846); Nees von Ambeck, Weihe, Walter, und Funke, *Vollständige Beschreibung officineller Pflanzen* (3 vols. Düsseldorf, 1811–1833).—Pereira's *Materia Medica* is also of very high excellence.

**MEDICINE, HISTORY OF.** There is reason to believe that Egypt was the country in which the art of medicine, as well as the other arts of civilised life, was first cultivated with any degree of success, the offices of the priest and the physician being usually combined in the same person. In the writings of Moses, there are various allusions to the practice of medicine amongst the Jews, especially the reference to the treatment of leprosy. The priests were the physicians, and their treatment was chiefly aimed at promoting cleanliness and preventing contagion. Chiron (q. v.), the centaur, is said to have introduced the art of medicine amongst the Greeks; but the early history of the art is entirely legendary. See *ÆSCULAPIUS*.

With a passing allusion to the names of Pythagoras, Democritus, and Heraclitus, who in their various departments may be regarded as having

advanced the art of medicine, we arrive at the time of Hippocrates (q. v.). The advance which Hippocrates made in the practice of medicine was so great, that no attempts were made for some centuries to improve upon his views and precepts. His sons, Thessalus and Draco, and his son-in-law, Polybius, are regarded as the founders of the medical sect which was called the Hippocratic or Dogmatic School, 'because it professed to set out with certain theoretical principles which were derived from the generalisation of facts and observations, and to make these principles the basis of practice.'

The next circumstance requiring notice in the history of medicine is the establishment of the school of Alexandria, which was effected by the munificence of the Ptolemies, about 300 years before the Christian era. Amongst the most famous of its medical professors are Erasistratus and Herophilus. The former was the pupil of Chrysippus, and probably imbibed from his master his prejudice against bleeding, and against the use of active remedies, preferring to trust mainly to diet and to the *vis medicatrix nature*. It was about this time that the Empirics formed themselves into a distinct sect, and became the declared opponents of the Dogmatists. The controversy, says Bostock, in his *History of Medicine*, really consisted in the question—how far we are to suffer theory to influence our practice. While the Dogmatists, or, as they were sometimes styled, the Rationalists, asserted, that before attempting to treat any disease, we ought to make ourselves fully acquainted with the nature and functions of the body generally, with the operation of medical agents upon it, and with the changes which it undergoes when under the operation of any morbid cause; the Empirics, on the contrary, contended that this knowledge is impossible to be obtained, and, if possible, is not necessary; that our sole guide must be experience, and that if we step beyond this, either as learned from our own observation, or that of others on whose testimony we can rely, we are always liable to fall into dangerous, and often fatal errors. According to Celsus, who has given an excellent account of the leading opinions of both sects, the founder of the Empirics was Serapion of Alexandria, who was said to be a pupil of Herophilus. At this period, and for some centuries subsequent to it, all physicians were included in one or other of these rival sects, and, apparently, the numbers of the two schools were about equal.

We learn from Pliny that medicine was introduced into Rome at a later period than the other arts and sciences. The first person who seems to have made it a distinct profession was Archagathus, a Peloponnesian, who settled at Rome about 200 B.C. His treatment was so severe and unsuccessful that he was finally banished; and we hear of no other Roman physician for about a century, when Asclepiades, of Bithynia, acquired a great reputation. His popularity depended upon his allowing his patients the liberal use of wine and of their favourite dishes, and in all respects consulting their inclinations and flattering their prejudices; and hence it is easy to understand the eminence at which he arrived. He was succeeded by his pupil Themison of Laodicea, the founder of a sect called Methodics, who adopted a middle course between the Dogmatists and Empirics. During the greater part of the first two centuries of our era, the Methodics were the preponderating medical sect, and they included in their ranks C. Aurelianus, some of whose writings have come down to us. They then broke up into various sects, of which the chief were the Pneumatics, represented by Aretæus of Cappadocia, whose works are still extant; and the Eclectics,

of whom Archigenes of Apamea was the most celebrated. But the most remarkable writer of this age is Celsus (q. v.), whose work *De Medicina* gives a sketch of the history of medicine up to his time, and the state in which it then existed. He is remarkable as being the first native Roman physician whose name has been transmitted to us. The names of Andromachus, the inventor of the Theriaca, a preparation which was retained in our pharmacopœias until the close of the last century—of Pliny the naturalist—and of Dioscorides, cannot be altogether omitted in even the briefest sketch of the early history of medicine; but their contributions to its progress dwarf into insignificance when compared with those of Galen (q. v.), whose writings were universally acknowledged as ultimate authority, until they were attacked and publicly burned in the 16th c. by the arch-quack, Paracelsus (q. v.). A learned and impartial critic, the late Dr Aikin, after giving full credit to Galen for talent and acquirements, thus concludes: 'His own mass and modern improvements have now in a great measure consigned his writings to neglect, but his fame can only perish with the science itself.' As in the case of Hippocrates, his immeasurable superiority over his contemporaries seems to have acted as a check to all attempts at further improvement.

The first names of any renown that occur subsequently to the death of Galen (about 193 A. D.) are those of Oribasius, Alexander of Tralles, Ætius, and Paulus Ægineta, who flourished between the fourth and seventh centuries. They were all zealous Galenists, and those of their writings which are extant, are, for the most part, compilations from their predecessors, and especially from their great master. With the death of Paulus, the Greek school of medicine may be considered to have come to an end, for after his time no works of any merit were written in this language. The Arabian school was now beginning to rise into notice. The earliest Arabic writer on medicine of whom we have any certain account is Ahrum, who was contemporary with Paulus. The most celebrated physicians of this school were Rhazes (who flourished in the 9th c., and was the first to describe the small-pox), Avicenna (q. v.), (who flourished in the 11th c., and whose *Canon Medicinæ* may be regarded as a cyclopædia of all that was then known of medicine and the collateral sciences), Albucasis (whose works on the practice of surgery were for several ages regarded as standard authorities), Avenzoar, and Averrhoes (q. v.), (who flourished in the 12th c., and was equally celebrated as a physician and a philosopher). The works of Hippocrates and Galen, which, together with those of Aristotle, Plato, and Euclid, were translated into Arabic in the 9th c., formed the basis of their medical knowledge; but the Arabian physicians did good service to medicine in introducing new articles from the East into the European materia medica—as, for example, rhubarb, cassia, senna, camphor—and in making known what may be termed the first elements of pharmaceutical chemistry, such as a knowledge of distillation, and of the means of obtaining various metallic oxides and salts.

Upon the decline of the Saracenic universities of Spain, which may date from the death of Averrhoes, the only medical knowledge which remained was to be found in Italy, where the school of Salerno acquired a considerable celebrity, which it maintained for some time, till it was gradually eclipsed by the rising fame of other medical schools at Bologna—where Mondini publicly dissected two human bodies in 1315—Vienna, Paris, Padua, &c. Contemporary with Mondini, lived Gilbert, the first English

writer on medicine who acquired any reputation. The next century gave birth to Linacæ, who, studying at Oxford, spent a considerable time at Bologna, Florence, Rome, Venice, and Padua, and subsequently became the founder of the College of Physicians. It was in this (the 15th) century that the sect of Chemical Physicians arose, who maintained that all the phenomena of the human body may be explained by the same chemical principles as those which rule inorganic matter. Although their illustrations and proofs which they adduced were completely unsatisfactory, a distinguished logical school of the present day is merged in a very similar view, with, however, far more powerful arguments in its support. The chemists of the 16th c., with Paracelsus at their head, did not advance medicine, except to introduce into the materia medica several valuable metallic preparations.

This period seems to have been prolific in the production of new diseases. It is in the 13th, 14th, and 15th centuries that we hear most of leprosy, the visitations of the plague in Europe, the sweating-sickness, the hooping-cough, and scurvy were common, or, at all events, not accurately described. It was towards the close of that century that the sweating-sickness was first recognised in Italy (from which it rapidly extended over the whole of Europe), and its first appearance in this country.

In the 16th c., the study of human anatomy was said to have been first fairly established by the zeal and labours of Vesalius (q. v.); and in the succeeding century we meet with the many physicians whose anatomical and physiological investigations materially tended, either directly or indirectly, to advance the science of medicine. The 17th c. was the epoch of Eustachius, Fallopius, Harvey, Rudbeck, Bartholin, Malpighi, Sylvius, Willis, Bellini, &c. Chemistry, separating itself from alchemy, and was raised into the state of a science, and a combination now formed between its principles and physiology, which gave rise to a new school of chemical physicians, quite distinct from the Galenists, who represented two centuries previously by Paulus. They considered that diseases were referable to certain fermentations which took place in the body, and that certain humours were natural, and others naturally alkaline, and according to one or other of these predominated, so specific diseases were the result, which could be removed by the exhibition of remedies of opposite nature to that of the disease. This soon succeeded by the Mathematical Physic, or the Iatro-mathematical school, of which Sauvages, Keill, Jurin, Mead, and Fernelius amongst the most celebrated. In proportion as the sect gained ground, that of the chemists, while the old Galenists were fast disappearing, these rival sects must be added that of the Iatro-chemical, which originated with Van Helmont (q. v.), which, with some modifications, was adopted by Stahl and Hoffmann. The greatest physician of the 17th c. was, however, unquestionably Sydenham (q. v.), who, though inclining towards the Iatro-chemical school, did not allow his speculative opinions to interfere with the nature of disease to interfere with treatment.

The most eminent teacher of medicine in the early part of the 18th c. was Boerhaave, who was elected to the chair of medicine at Leyden. Amongst the pupils of Boerhaave must be specially mentioned Van Swieten, whose comments on the aphorisms of his master contain a valuable collection of practical observations.

v.), the father of modern physiology; amongst the most celebrated opponents of an theory, that irritability and sensibility properties of the muscular and nervous system were mentioned Whytt and Porterfield, of high reputation in Edinburgh, and Professor of Medicine in the university. article upon Cullen (q. v.), so full an given of the doctrines of that celebrated that it is unnecessary to add more than of the distinguished physicians of the of the 18th c. belonged to what may the Cullenian school of medicine. His attacked with great acrimony by his stant, John Brown, the founder of the system of medicine. In this country, of Brown were regarded as too purely and did not acquire any great popularity; e parts of the continent, and especially in were very generally adopted, and became lerable time the prevailing doctrine in the leading medical schools. To supple- seagre outline of the progress of medicine c., the reader is recommended to consult phical sketches of Monro, Blane, the inner, &c.

MEDICK (*Medicago*), a genus of plants of the natural order *Leguminosæ*, sub-order *Papilionaceæ*, nearly allied to CLOVER (q. v., *Trifolium*), but distinguished from that and other kindred genera by the sickle-shaped, or, in most species, spirally twisted legume. The species, which are very numerous, are mostly annual and perennial herba- ceous plants, with leaves of three leaflets like those of clover, natives of temperate and warm climates. A number of them are found in Britain, and many more in the south of Europe. They generally afford good green food for cattle, and some of them are cultivated like the clovers for this use, amongst which the most important is the PURPLE M. or LUCERNE (q. v., *M. sativa*). Besides this, the BLACK M., NONSUCH, or LUPULINE (*M. lupulina*), is one of the most generally cultivated. It receives the name Black M. from the black colour of the ripe pods, which are short, black, twisted, and arranged in oblong heads, and is often called Yellow Lucerne, or Yellow Clover, from the colour of its flowers. It is a common native of Britain. In habit and general appearance, it is very similar to *Trifolium procumbens*, or *T. Filiforme*. In British husbandry, it is now very generally sown in mixture with Red Clover and Rye-grass, and is useful where a close turf is desired.

MEDIETATE LINGUÆ, JURY DE. See JURY.

MEDINA (Arab. City), or, more fully, MEDINAT AL NABI (City of the Prophet), also called TABAH, TIBAH, &c. (the Good, Sweet, &c.), and mentioned by Ptolemy as Jathrippa: the holiest city throughout Mohammedanism, next to Mecca, and the second capital of Hedjaz in Western Arabia, is situated about 270 miles N. of Mecca, and 140 N. by E. of the port of Jembo on the Red Sea, and contains about 16,000 inhabitants (Burton). It consists of three principal parts—a town, a fort, and suburbs, of about the same extent as the town itself, from which they are separated by a wide space (the Munakha). M. is about half the size of Mecca, and forms an irregular oval within a walled enclosure of 35–40 feet high, and flanked by thirty towers—a fortification which renders M. the chief stronghold of Hedjaz. Two of its four gates—viz., the Bab Al Jumah (*Friday Gate*, in the eastern wall) and the Bab Al Misri (*Egyptian*)—are massive build- ings with double towers. The streets, between fifty and sixty in number, are deep and narrow, paved only in a few places. The houses are flat-roofed and double-storied, and are built of a basaltic scoria, burned brick, and palm-wood. Very few public build- ings of any importance are to be noticed beside the Great Mosque Al Haram (the Sacred), supposed to be erected on the spot where Mohammed died, and to enclose his tomb. It is of smaller dimensions than that of Mecca, being a parallelogram, 420 feet long and 340 feet broad, with a spacious central area, called El Sahn, which is surrounded by a peristyle, with numerous rows of pillars. The Mausoleum, or Hujrah, itself is an irregular square, 50–55 feet in extent, situated in the south-east corner of the building, and separated from the walls of the mosque by a passage about 26 feet broad. A large gilt crescent above the 'Green Dome,' springing from a series of globes, surmounts the Hujrah, a glimpse into which is only attainable through a little opening, called the Prophet's Window; but nothing more is visible to the profane eye than costly carpets

or hangings, with three inscriptions in large gold letters, stating that behind them lie the bodies of the Prophet of Allah and the two califs—which curtains, changed whenever worn out, or when a new sultan ascends the throne, are supposed to cover a square edifice of black marble, in the midst of which stands Mohammed's tomb. Its exact place is indicated by a long pearly rosary (Kaukab Al Durri)—still seen in 1855—suspended to the curtain. The Prophet's body is supposed to lie (undecayed) stretched at full length on the right side, with the right palm supporting the right cheek, the face directed towards Mecca. Close behind him is placed, in the same position, Abubekr, and behind him Omar. The fact, however, is, that when the mosque, which had been struck by lightning, was rebuilt in 892, three deep graves were found in the interior, filled only with rubbish. Many other reasons, besides, make it more than problematic whether the particular spot at M. really contains the Prophet's remains. That his coffin, said to be covered with a marble slab, and cased with silver (no European has ever seen it), rests suspended in the air, is a stupid story, invented by Christians, and long exploded. Of the fabulous treasures which this sanctuary once contained, little now remains. As in Mecca, a great number of ecclesiastical officials are attached in some capacity or other to the Great Mosque, as Ulemas, Mudarisin, Imaums, Khatibs, &c.; and not only they, but the townspeople themselves live to a great extent only on the pilgrims' alms. There are few other noteworthy spots to be mentioned in M., save the minor mosques of Abubekr, Ali, Omar, Balal, &c. The private houses, however, surrounded by gardens, fountains, &c., have a very pleasing appearance; and the city, although in its decay, is yet one of the busiest and most agreeable. Thirty Medresses, or public endowed schools, represent what learning there is left in the city, once famed for its scholars.

**MEDINA SIDONIA** (Arab. *Medinat-Shidunah*, 'City of Sidon,' so called by the Moors because they conjectured it to be the site of the Phœnician *Asidon*), a city of Spain, 25 miles east-south-east of Cadiz. It has a picturesque and splendid appearance at a distance; but within, it is described as 'a whitened sepulchre full of decay.' It is of Moorish origin, and contains a beautiful Gothic church, and extensive ruins of a castle. The town gives the title of duke to the descendants of the famous Guzman the Good, and is otherwise noted in Spanish history. Population 10,800, who carry on manufactures of earthenware.

**MEDINET-EL-FAYÛM.** See **FAYÛM**.

**MEDITATIO FUGÆ**, a phrase used in Scotch law to denote an intention to abscond from the jurisdiction of the ordinary courts. It is used chiefly in reference to debtors. Wherever a creditor in Scotland believes—i. e., can make an oath or affidavit that he has reasonable ground to believe—that the debtor is about to leave the country in order to evade payment of debts, he can obtain from a justice of the peace a warrant to apprehend the debtor. The consequence of this is, that the debtor must either pay or give security, or remain in prison till the cause is tried. The process may be used either against natives or foreigners who have lived forty days in Scotland, but not where they are merely passing through the country on business or pleasure. The warrant may be executed on a Sunday as well as other days. It may also be executed within the Sanctuary of Holyrood. Though creditors often avail themselves of this compulsor to recover their debts, they are liable to an action, if they maliciously, and without cause, procure the debtor's

arrest; and if the debtor can shew that he intended, at the time in question, to leave the country, and that the creditor had no just cause to believe he so intended, an action of damages lies.—In England and Ireland, there is a process. See **DEBTORS, ABSCONDING**.

**MEDITERRANEAN SEA**, so named, being almost entirely enclosed by the continents of Europe, Asia, and Africa, one of the greatest seas in the world, extends (inclusive of the Marmora, but exclusive of the Black Sea and of Azof) to about 1,000,000 square miles. Its length from east to west is about 2320 miles, its breadth about 1080, but it is divided into two basins by the approach of the European and African coasts in its middle. It is connected with the Atlantic Ocean only by the Straits of Gibraltar, through which a strong current continually flows into the Mediterranean. Another strong current also flows into it from the Black Sea, which supplies it with large supplies of fresh water, whereas the rivers which fall into the M. itself are comparatively few; the principal being the Elbro, the Rho-danus, the Po, from Europe; and the Nile, from Africa. It receives no large river from Asia. The elevation from the surface of the M. is, on the whole, greater than what takes place in the ocean, owing to the heat which proceeds from the African deserts, and the shelter which they afford from the cold winds of the north. The surface temperature, dependent on the intensity of the solar radiation, is in summer about 5° above the Mediterranean. By the expeditions for scientific exploration of the Deep Sea in 1870, it has been ascertained that the effect of this surface heating is limited to a depth of a few fathoms; at every depth beneath this, even to 1900 fathoms, the temperature of the M. is that of the Atlantic, is uniform, and stands at 54° or 55°. This is, in fact, the winter temperature of the entire contents of the basin, from the surface downwards, and also the mean temperature of the crust of the earth in that region. In winter the temperature of the M. and the Atlantic approach very closely. In consequence, probably, of the greater evaporation, the water of the M. contains more salt than the Atlantic Ocean, and its specific gravity is almost everywhere greater than that of the Atlantic, being in the proportion of 1.0286 to 1.0283. Its colour, when undisturbed, is a bright deep blue; but in the Adriatic and in the Levant a purple tinge prevails, and in the dark hue of the Euxine is indicated in its northern 'Black Sea.' Different parts of the M. have different names—as the *Ægean Sea*, the *Ionian Sea*, the *Adriatic Sea* or *Gulf of Venice*, &c. Its eastern coast is very much broken with bay and peninsula, and abounds in harbours, affording shelter to the inhabitants of the south of Europe great advantage for commerce, of which the M. S. was the seat during all periods of history, till towards the close of the middle ages, when, after the invention of the mariner's compass, a spirit of maritime adventure sprang up, and the discoveries of the Portuguese and of Columbus led to the extension of commerce over the whole world. The coast of the Egyptians, the Phœnicians, the Greeks, and the Romans was almost entirely confined to the M. S.

The depth of the M. S. is generally greater in its western basin. In many places it is 3000 fathoms deep. Near Nice, it is 4200 feet deep at a distance of only a few yards from the shore. In the Straits of Gibraltar it is about 5500 fathoms deep, and it is highly probable that the coasts of Europe

## MEDJIDIE—MEERSCHAUM.

re once united here, and have been separated by a great convulsion; it is also supposed to have once stretched from Sicily to Cape Bon in the present day. Here now a ridge exists along which there is most part a depth of scarcely 200 feet, and in some places of little more than 40 feet. On each side, at a short distance, the depth is more than 6000 feet. The M. S. is subject to north, and north-easterly winds for more than three-fourths of the year, while in spring the south and south-west winds prevail. The most common of those winds which are peculiar to the coast is the *solano* or *levanter*. In the Gulf of Suez the greatest tides rise about three feet, but in the Great Syrtis, five feet, but in most places the tides are scarcely observable. According to measurements of Napoleon's Egyptian expedition (1799), the surface of the M. S. in the neighbourhood of Alexandria was from 24 to 30 feet higher than that of the Red Sea at Suez; but recent measurements have shewn that the difference of level is inconsiderable, and that the level of the Red Sea is at most six inches higher than the Mediterranean.

643 species of European sea-fishes, 444 of which are M. S., some of which are peculiar to the Mediterranean, a greater number of species than the coast of Scandinavia, but does not nearly abound in useful kinds. Tunny-fishing is very much prosecuted on some parts of its coasts. In the Red Sea, which is procured in great quantities on the coasts of Provence, of the Balearic Islands, of Sicily, but particularly on the coasts of Barca in Africa. The M. S. are in many parts subject to earthquakes. Besides the existing volcanoes of Etna, Vesuvius, and Stromboli, many evidences of recent volcanic action, such as the occurrence of islands suddenly by it, where volcanic fires have appeared at a late time.

**MEDJIDIE**, a Turkish order, instituted in 1852, named after the Crimean campaign, to a great extent, on British officers. It has five different classes, the first of which is a silver sun of seven rays, with the device of the crescent and star in the centre of the decoration, which differs in size according to the rank. The second class is a red ribbon having green borders, and the third and fourth classes wear it attached to a ribbon on the left breast. A star, in design resembling the badge, is worn on the left breast of the first class, and on the right breast by the second class.

**MEDJIDIE** (*Mespilus*), a genus of trees or shrubs of the natural order *Rosacea*, sub-order *Pomea*, 5-cleft calyx with leafy segments, nearly equal, a large honey-secreting disk, and 2—5 stamens united together in the flower, but widely separated on the fruit, the upper ends of the bony segments which are exposed. The **COMMON M. (M. germanica)**, a large shrub or small tree, spiny, glabrous, but destitute of spines in cultivation, native of the south of Europe and of the north-western parts of Asia, but is a doubtful native of England. It has lanceolate leaves divided into serrated, solitary large flowers at the end of small spurs, and some-

what top-shaped fruit, of the size of a small pear or larger, according to the variety. The M. is much cultivated in some parts of Europe, and is common in gardens in England, but it does not generally ripen well in Scotland without a wall. It is very austere, even when ripe, and is not eaten till *blotted*, when its tough pulp has become soft and vinous by incipient decay.

**MEDULLA OBLONGATA.** See **BRAIN**.

**MEDULLARY RAYS.** See **EXOGENOUS PLANTS** and **PITH**.

**MEDULLARY SARCOMA** is one of the synonyms for that variety of Cancer (q. v.) which is also known as encephaloid, cellular cancer, medullary cancer, fungus medullaris, &c. It grows more quickly, distributes itself more rapidly, and attains a more considerable bulk than any other form of cancer, tumours of this nature being often as large as a man's head, or even larger. Of all forms of cancer, it runs the quickest course, soonest ulcerates, is the most malignant, and causes death in by far the shortest time, often destroying life in a few weeks, or, at furthest, in a few months after its first appearance, unless it has been removed by an operation at an early stage.

When it ulcerates, fungoid growths form upon the surface; they are extremely vascular, and bleed on the slightest provocation. In this state, the disease has received the name of *Fungus hæmatodes*.

**MEDUSA.** See **ACALEPHÆ**, and **GENERATIONS, ALTERNATION OF**.

**MEDWAY**, a river of England, rises near the northern border of the county of Sussex, and, after a north-east course of upwards of 50 miles, it joins the Thames at Sheerness. At Penshurst, 40 miles from its mouth, it becomes navigable. The chief towns on its banks are Maidstone, Rochester, Chatham, and Sheerness. Large vessels do not ascend above Rochester Bridge, but below that the river widens into an estuary, and forms an important harbour for the navy.

**MEEANEE**, or **MIYANI**, a village in Sind, Hindustan, on the Indus, six miles north of Hyderabad, is celebrated as the scene of a great battle fought between Sir Charles Napier and the Ameers of Sind, February 17, 1843. Sir Charles's force, composed partly of Europeans, and partly of natives, amounted to only 2800 men; that of his foes to 22,000, yet the latter were totally routed, losing in killed and wounded 5000 men. Sir Charles's loss was only 256. The result of this victory was the conquest and annexation of Sind.

**MEERSCHAUM**, a mineral existing in many parts of the world. In Europe, it is found chiefly at Hrubschitz in Moravia, and at Sebastopol and Kaffa in the Crimea; and in Asia it occurs abundantly just below the soil in the alluvial beds at Kittisch and Bursa in Natolia; and in the rocks of Eski-Hissar in the same district, it is mined so extensively as to give employment to nearly a thousand men. M., from its having been found on the sea-shore in some places, in peculiarly rounded snow-white lumps, was ignorantly imagined to be the petrified froth of the sea, which is the meaning of its German name. Its composition is, silica, 60.9; magnesia, 26.1; water, 12.0. Almost all the M. found is made into tobacco-pipes, in which manufacture the Germans have been for a long time pre-eminent. Vienna contains many manufactories, in which some very artistic productions are made; and pipes worth a hundred guineas, from the beauty of their designs, are by no means uncommon. The French pipe-makers have lately used M., and have displayed great

## MEERUT—MEGATHERIUM.

taste in their works. When first dug from the earth, M. is quite soft and soap-like to the touch, and as it lathers with water, and removes grease, it is employed by the Turks as a substitute for soap in washing. The waste in cutting and turning the pipes was formerly thrown away, but it is now reduced to powder, mixed into a paste, and compressed into hard masses, which are carved into inferior pipes.

MEERUT, MERUT, or MIRUT, the chief town of a district of the same name in British India, in lat. 29° N., long. 77° 40' E., on the Kali Nuddi, about 42 miles north-east of Delhi. Its most important edifice is the English Church, a fine building, with an excellent organ, and large enough to accommodate 3000 persons. The climate of M. is healthy. Pop. 81,386. The cantonment is situated two miles north of the town; on the opposite side of the stream are quarters of the native infantry. Here, on the 10th May 1857, the native troops revolted, shooting their own European officers, firing the bungalows, and massacring the European inmates without respect to age or sex.—The district of M., forming a portion of the Doab (q. v.), has an area of 2368 square miles, and a population (1872) of 271,454.

MEETING, an assemblage of people called with a view to deliberate on some specified subject, or to accomplish some specified purpose. The proceedings begin with the choice of a chairman, or presiding officer, and consist in the proposing and seconding of resolutions, on which the voice or vote of the meeting is taken. The chairman, in addition to his deliberative vote, is often entitled to give a second or casting vote, in case of equality. Any number of persons may in this country assemble for any purpose not in itself illegal; but the use of force or violence, or any tendency towards it, may entitle the authorities to interfere with a meeting, as an unlawful assemblage. Meetings called, not officially, but by private arrangement, are looked on in the continent as a characteristically English institution; in most parts of the continent, the right of holding such assemblages is more or less restricted by law.

MEGALICHTHYS (Gr. great fish), a genus of fossil heterocercal ganoid fishes, so named from their large size, compared with the other fish of the period. They were covered with large strong rhomboid scales, composed externally of brilliantly polished brown enamel, usually granulated, as in the scutes of the recent crocodile. These scales have been found as large as five inches in diameter. The head was defended by similar strong plates, and the jaws were furnished with immense laniary teeth, of a size rarely attained, even in the largest modern reptiles, and so closely resembling them, that they were for some time considered as having belonged to some crocodilian animal. These teeth—specimens of which have been found measuring four inches long and two broad at the base—were smooth at the point, had a long furrowed root, and a hollow base, in which the new tooth was prepared. Numerous smaller teeth were scattered over the jaw among the large ones. The fish of this genus must have been the terror of the seas they inhabited. Their strong skeleton, large tail, powerful head, and ferocious jaws remarkably suited their carnivorous habits.

Three species have been described from the carboniferous strata of Edinburgh, Glasgow, and the centre of England.

MEGALOSAURUS (Gr. great lizard), a genus of fossil Dinosaurs, or land-saurians, of gigantic size and carnivorous habits, whose remains occur in

the rocks of the Oolite period. The huge animal was supported on four large and ungulate limbs; specimens of the femur and tibia have been found measuring each nearly two feet, giving a total length of almost two yards to the hind leg; and a metatarsal bone thirteen inches long shews that the foot had a corresponding breadth. The sacrum was composed of five vertebrae ankylosed together, as in the other Dinosaurs. Buckland calculated that the megalosaurus have been 60 or 70 feet long; but it is not that a reptile raised so high above the ground would have its body and tail so large in proportion to its limbs, as in our modern lizards or crocodiles. There seems good reason for rather accepting a more moderate estimate of thirty feet as its length. A fragment of the lower jaw, containing several teeth in position, tells of its carnivorous habits. Only a single species has been referred to this genus. Its remains are abundant in the field slate, in the lower Oolite of Gloucestershire, and in the Wealden and Purbeck limestones.

MEGAPODIDÆ, a family of Birds, referred by some naturalists to the order *Grallæ*, but generally to the Gallinaceous order, being related as allied to the Curassows, &c. The feet are large and have large blunt claws. To this order belong the genera *Megapodius* (see JUNGLE-POULTRY, q. v.), *Talegalla* (q. v.), &c. The order is found in New Holland and the neighbouring islands.

MEGARIC SCHOOL. See EUCLID.

MEGARIS, a small mountainous region of Hellas, or Greece Proper, bounded by Attica, Corinth, and the sea. It formed the north-west part of the Isthmus of Corinth. The capital was MEGARA, famous amongst the ancients for its shell marble, and for a white kind of clay, of which pottery was made.—From Euclid, the philosopher who was born at Megara, about 400 B.C., the MEGARIC SCHOOL took its name.

MEGATHERIUM (Gr. great beast), a name given to an extinct quadruped of the order Edentata, allied to the sloth, found in the superficial strata of the South American Pampas. In structure it was very near its modern representative, except

Skeleton of the Megatherium.

the whole skeleton is modified to suit the requirements of an immense heavy-boned and heavy-bodied animal, some 18 feet in length and 8 feet in height. The appellation tardigrade, which Cuvier applied

ED or MEHEMET ALI, also MO- ALI, Viceroy of Egypt, was born in la, a little town in Macedonia, entered army at an early age, and, in 1799, was

sent to Egypt at the head of a contingent of 300 troops to co-operate with the British against the French invaders. Here his fine military qualities rapidly developed themselves, and he at length became commander of the Albanian *corps d'armée* in Egypt. In 1806, he was recognised by the Porte as Viceroy of Egypt, and Pasha of Three Tails; but was soon involved in disputes with the Mamelukes, who had long practically ruled Egypt. The struggle was finally terminated in 1811, by the massacre of the greater number of these at Cairo. The rest fled to Upper Egypt, but were expelled by M. in the following year. They then took refuge in Nubia from their remorseless foe, but in 1820 he followed them thither, and they were utterly exterminated.

The Porte now felt alarm at his growing power, and with a view to break it, intrusted him with the command of an expedition against the Wahabis, a religious sect of Arabia. But the victories of his son, Ibrahim Pasha (q. v.), only rendered him more powerful, and his authority extended itself over a great part of the Arabian peninsula. Shortly after, he conquered Kordofan, added it to his dominions, and opened up a great trade in black slaves from the interior of Africa. About this time he began to reorganise his army on something like European principles, built a fleet, and erected fortresses, military workshops, and arsenals. His ambition, however, received a severe check by the total destruction of his new navy at Navarino, in 1827. In 1830, the Porte conferred on him the government of Candia, but this did not satisfy him; and in the following year, on a frivolous pretext, he sent out an army for the conquest of Syria, under Ibrahim Pasha, who, by his victory at Konieh (20th December 1832), brought the Turkish government to the brink of ruin. The European powers now stepped in, and a treaty was concluded (May 4, 1833), by which Syria was ceded to M., on condition of his acknowledging himself a vassal of the sultan. Neither of the belligerents was satisfied, and M. continued to plot in his usual secret and crafty style, till Sultan Mahmud was obliged in 1839 to declare war against his dangerous subject. The European powers again interfered, and M. saw himself compelled to give up all his claims to the possession of Syria, and to content himself with getting the pashalic of Egypt made hereditary in his family. If the infirmities of age had not now begun to tell upon M., he might have become what many in fact have pronounced him to be—the regenerator of Egypt! He thoroughly cleared the country of robbers from Abyssinia to the mouths of the Nile; he may almost be said to have introduced the cultivation of cotton, indigo, and sugar into the country. While Syria was under his rule, he increased to an immense extent the mulberry plantations, and consequently the cultivation of silk; and to crown all his efforts, he established in Egypt a system of national education! In his last years, he fell into a sort of religious dotage, and at last, in 1848, resigned his viceroyship in favour of his son, Ibrahim Pasha (q. v.). M. died August 2, 1849.

MEININGEN, the capital of the duchy of Saxe-Meiningen-Hildburghausen, lies in a narrow valley, on the banks of the Werra. Pop. 8876. The ducal castle, built in 1681, contains a fine library and several art collections. The 'English garden' attached to it is one of the finest in Germany. M. has almost no trade.

MEISSEN, one of the oldest towns in the kingdom of Saxony, is situated on the left bank of the Elbe, 15 miles below Dresden. Its chief building is the cathedral, the finest Gothic church in Saxony,

surmounted by an exquisite spire of open work, and containing many monuments of very early times. There are here a number of brasses, some of them finer than any in England or Flanders. M. was founded in 928 by Henry I. of Germany, as a bulwark of his German territories against the Slavonians, and was long the capital of the markgraviate of M., which was subsequently merged in the duchy of Saxony. Otto I. founded the cathedral. It was, however, burned down at the beginning of the 13th c.; rebuilt, 1266—1293; since which time it has been twice destroyed by fire, and restored. The castle, built on a precipitous rock overlooking the town, and formerly the residence of the markgraves, burgraves, and bishops of M., was rebuilt in 1471; and in 1710, was converted into a porcelain factory, in which the famous Dresden china is made. In this factory, 400 hands, of whom 100 are painters, are employed. The other chief manufactures are leather, hosiery, artists' colours, brushes, &c. Pop. (1871) 11,455.

MELA, POMPONIUS, a Latin writer—the first who composed a strictly geographical work—was a native of Spain, and is believed to have lived in the time of the Emperor Claudius, but nothing whatever is known concerning him. M.'s compendium is in three books, and is entitled *De Situ Orbis*. The text is greatly corrupted, on account of the abundance of proper names; but the style is good, and the author shews a very creditable diligence of research and discrimination in the use of his authorities. The *editio princeps* appeared at Milan in 1471; the best edition is that of Tzschuckius (Leip. 1807). M. was translated into English as long ago as 1585.

MELALEUCIA. See CAJEPUT.

MELANCHOLIA, as a disease, is the exaggeration of the natural and legitimate feelings of grief, despondency, and apprehension, which become morbid where the emotion is without a cause, disproportioned to the actual cause, or so intense as to disturb and destroy the exercise of the other mental powers. This dejection and suffering is found associated with exalted sensations, or delusions as to the personal or physical condition of the individual, which originate in habitually cherishing certain impressions, in fixing the attention upon certain vital processes, which may be unhealthy, or become so by the very concentration of thought bestowed upon them. The patient lives in fear of death, in the conviction that he is differently or more exquisitely constructed than those around; that he labours under some foul or fatal disease; that he is destitute of strength or comeliness. This has been regarded as hypochondriacal melancholia—the *maladie anglaise*, and affects the opening of life. Similar feelings are called forth in reference to the social position. There arises a dread of poverty and want. The victim is haunted by imaginary debts, obligations, peculations. He feels incapable of extricating himself. The poor, as well as the rich, entertain such doubt and dread. They starve, in order to husband their resources. This affection prevails at maturity—at the period of greatest activity and usefulness. Towards the decline of life—although encountered at every age—morbid depression assumes the form of religious anxiety, despair, remorse. Moral statistics shew that among the inhabitants of Northern Europe the number of cases of melancholia exceeds those of mania; and it has been supposed that the rudiments of the malady may be detected in the original character, the temperament and the habits of the race, as well as in the climate, domestic condition, and diet, by which these are modified. Defective blood nutrition, or

anæmia, appears to be the physical state which the great majority of cases of melan are connected, and to which all modes of treatment are directed. Powerful and permanent and doing moral emotions act as effectively in a healthy digestion and alimentation, as the injudicious food, or the use of proper nourishment under circumstances such as the respiratory impure air, or indulgence in intemperate or dissipated tendencies, which render assimilation impossible. The aspect of the melancholic corroborates that of inanition and exhaustion. The surface is dry, cold, attenuated, even insensible; the features are rigid; the frame is bent; the eyes sunken, fixed or flickering; the lips parched and cold. There is a sense of exhaustion or pain, or impending dissolution. It has been remarked, that in proportion to the intensity of the internal agony is an obtuseness or anæsthesia to wounds or other injuries. Such an immunity gives in lunacy indifference to the most grievous forms of suffering, and may explain the conduct of many martyrs and even criminals under punishment. Haslam, *Observations on Madness and Melancholia*, *Esquirol, Maladies Mentales*, t. i. p. 398; Crook, *Inquiry into Nature and Origin of Mental Disorders*.

MELANCHTHON, PHILIP, Luther's labourer in the Reformation, was born, 16 February 1497, at Bretten, in the Palatinate of the Rhine, now in the grand duchy of Baden. His name was originally Schwarzerd (black ear), from which M. is a Greek translation. He was educated at the university of Heidelberg, where he took the degree of Bachelor of Philosophy in 1512. The same year he went to Tübingen, studied there, and took the degree of Master, and in 1514, gave lectures on the Aristotelian philosophy and the metaphysics. About this time, he published a Greek grammar. On his relative Reuchlin's recommendation, he was appointed, in 1518, professor of the Greek language and literature in Wittenberg. He soon declared in favour of the Reformation, and brought to the attention of Luther great attainments in learning, acuteness in dialectics and exegesis, a remarkable power both of clear thinking and of clearly expressing his thoughts; and, along with all, a gentleness and moderation that most advantageously tempered Luther's vehemence. In 1521, he published *Loci Communes Rerum Theologicarum*, the great Protestant work on dogmatic theology, which passed through more than fifty editions in the course of the author's life. In 1530, he made his most important contribution to the cause of Protestantism in the Augsburg Confession (q. v.). In 1541, he went to Worms, and soon after to Rome, to conduct the cause of the Protestants at the conferences there. But the influence of the legate counteracted all his efforts for a peaceful accommodation, and his own party were dissatisfied on account of the concessions which he made. After Luther's death, M. lost in a great measure the confidence of some of the Protestants by those concessions to the Roman Catholics. His anxiety for peace led him to make; while zealous Lutherans were no less displeased by his approximation to the doctrine of transubstantiation on the Lord's Supper. His consent, conditioned, to the introduction of the Augsburg Confession (q. v.) in Saxony, in 1549, led to painful controversies; and he was involved in various controversies, which filled the latter years of his life with inquietude. He died at Wittenberg, 19th April 1560. M., although gentle, was emotionally excitable, and conciliatory in the extreme. As a public teacher, he was exceedingly admired.

# MELANORRHŒA—MELBOURNE.

Students flocked to him from all parts of Europe. He was essentially a theologian and scholar, and in his habits, if not in his opinions, was the precursor of those acute and laborious divines who have in modern times shed so much lustre on the German church. The most complete edition of his works, which comprise a Greek and Latin Grammar, editions of and commentaries on several classics of the Septuagint, biblical commentaries, doctrinal and ethical works, official documents, declarations, dissertations, responses, and a very extensive correspondence with friends and the leading men of the age, is that by Bretschneider in his *Corpus Reformationis* (28 vols. 1834—1860). M.'s life has been written by his friend Camerarius (1566), and frequently in the course of the present century. The best is that by Wohllahrt (1860). The tricentenary of M.'s death (April 19, 1860) was celebrated with great solemnity throughout Germany.

**MELANORRHŒA**, a genus of trees of the natural order *Anacardiaceæ*.—To this genus belongs a BLACK VARNISH TREE (*M. usitata*) of Burmah and the north-east of India, called *Theet-tsee* or *tei* in Burmah, and *Kheu* in Munipoor. It is a very large tree, attaining a height of 100 feet, with large, leathery, simple, entire, deciduous leaves, and terminal panicles of flowers. It yields a viscid rust-colored juice, which becomes black on exposure to the atmosphere, and is excessively acrid, causing swellings with much pain and fever if it touches the skin. It is, however, much valued as a varnish for painting boats, and vessels intended to contain acids, and also as a size-glue in gilding. This black varnish is a considerable article of trade in India and Burmah.

**MELANTHACEÆ**, a natural order of endogenous plants; containing bulbous, tuberous, and stolon-rooted plants, with or without stems, and having parallel-veined leaves which are sheathing at the base. The fruit is a capsule, generally divisible into three pieces.—There are about 130 known species, natives of all parts of the world, but most abundant in northern countries. Some resemble lilies, and some are like small lilies. The order is characterised by a great prevalence of poisonous qualities. Some of the species are employed in medicine, particularly *Colchicum* (q. v.), White Hellebore (*Veratrum album*, see HELLEBORE), and *Adonis* (q. v.). The root of *Helonias dioica* is used in North America as an anthelmintic and is said to be bitter. The plant grows in wet places, and is called *Starwort* and *Blazing Star*, also *Unicorn's horn* and *Devil's Bit*.

**MELASTOMACEÆ**, a natural order of exogenous plants, containing about 1200 known species; trees, shrubs, and herbaceous plants, mostly natives of warm climates, although a few are found in the temperate parts of North America. They have opposite undivided leaves, destitute of dots. The flowers are regular.—None of the M. possess poisonous properties; some are used in dyeing; the naturally acid leaves of some are cooked and eaten, particularly those of species of *Medinilla* and *Strobilanthus* in the Malay Archipelago; some yield edible and pleasant fruits, as *Blakea triplinervia* in Guiana, *Clidemia hirta* in the West Indies, and *Memecylon edule* in Coromandel. The wood of some is tough and hard.

**MELBOURNE**, capital of the British colony of Victoria, in Australia, is situated chiefly on the north bank of the Yarra-Yarra, about nine miles by water and two miles by land above its mouth, in the spacious bay of Port-Phillip. Lat. 37° 48' S., long. 144° 58' E. Its streets are straight, regular, and wide, and are paved, macadamised, and

plentifully supplied with gas and fresh water. Collins Street, one of the leading thoroughfares, is one-third wider than the famous Broadway of New York. M. is built of brick and stone, and contains many fine churches. Perhaps nothing gives stronger testimony to the wealth and enterprise of the inhabitants of M., than the rapidity with which so many noble institutions as adorn the city have sprung up among them. Among these, one of the chief is the university, with an annual endowment from the state of £9000, and possessing valuable scholarships and exhibitions. It is a large building, in the shape of a parallelogram, and is surrounded by extensive grounds. It was opened in April 1855, and has a respectable staff of professors, with a considerable attendance of students in arts, law, engineering, &c. The post-office, a magnificent structure, in the Italian style, elaborately ornamented with sculpture, and having one of its façades surmounted by four towers, was built in 1859. The Yan-Yean water-works, by means of which water is conveyed by iron pipes into all parts of the city from a distance of 18 miles, were opened in December 1857. The Parliament Houses were erected in 1855, at a cost of £400,000. Besides these, the chief institutions are the Melbourne Hospital, the Benevolent Asylum, the Immigrants' Home, the Servants' Home, the Orphan Asylums, the Lying-in-Hospital, Treasury, County and City Courts, Public Library, Custom-house, Barracks, the numerous richly ornamented banks, the Grammar-school, Scotch College, besides many other educational establishments, and numerous literary and scientific institutions and societies. There are three daily newspapers, an evening journal, and several weeklies and monthlies. M. is the centre of eight converging lines of railway; several of these being, however, only suburban lines. There are several theatres and public parks. The temperature is moderate; the mean of the year being 59°, and the variation between the average temperature of January (midsummer) and July (winter), 19°. The annual rainfall is about 32.33 inches. M. occupies the first rank among the ports of the British colonies, and is the most important trading town of the southern hemisphere. The population, including the suburbs, is 191,254. The chief exports are gold, silver, wool, hides, cattle, and sheep. Six-sevenths of the entire commerce of the colony is carried on by Melbourne. For further information regarding trade, &c., see VICTORIA. Vessels drawing 24 feet can come up to the mouth of the Yarra-Yarra, but are unable to ascend the river, on account of two bars which obstruct its course. M., however, is connected with Sandridge on Port Phillip by means of a railway two miles long. The chief industrial establishments of M. are flour-mills, tallow-boiling works, and brass and iron foundries.

PORT-PHILLIP, on which M. is situated, is a spacious and beautiful inlet of the South Pacific Ocean, on the south coast of Australia, and is 35 miles long, by about 25 miles broad. Its entrance, which is only 2 miles in width, is formed by two projecting promontories, called the Heads; and on these promontories strong fortifications were erected in 1861. Navigation at the entrance of the port is difficult and dangerous, on account of the foul ground on either side, and the violence of the ebb and flood tides, which is caused by the unevenness of the bottom.

M. was first colonised in 1835, and received its name from Lord Melbourne, then the British prime minister, in 1837. It became the seat of a bishop in 1847, and in 1851 the capital of the newly-formed colony of Victoria. The discovery of gold

...tation from the Whigs was increased when he not only took office under Lord Goderich, but remained for a short time in the government of the Duke of Wellington. In 1828, the death of his father transferred him to the Upper House. In 1830, he accepted the seals of the Home Office in the government of Earl Grey, but his administration was by no means popular or successful. In July 1834, Earl Grey retired, and William IV. sent for Melbourne. In November, the king chose to consider the removal of Lord Althorp to the Upper House as the breaking up of the Melbourne Ministry, and sent for Sir Robert Peel, to form a Conservative administration. But the House of Commons resented the interference of the Crown; and a new parliament having shattered the new government, M. again became First Lord of the Treasury. On the accession of Queen Victoria in 1837, it became the duty of M. to instruct the young sovereign in the various duties of her high station, and fit her to perform her part as the constitutional monarch of a free country. In 1841, his government was succeeded by that of Sir Robert Peel. Henceforward, M. took little part in public affairs. He had little of the oratorical faculty, and was ineffective as a speaker, but possessed a cheerful temper and cordial frankness of manner, which made him many friends. He possessed classical tastes and rare social qualities, joined with an easy temper and careless habits. Sydney Smith, in his second letter to Archdeacon Singleton, has described his character with an exquisite mixture of sarcasm and compliment. He married (1805) a daughter of the Earl of Bessborough, who, under the title of LADY CAROLINE LAMB (born 1785, died 1828), attained some celebrity as a novel-writer and a correspondent of Lord Byron. M. died November 24, 1848.

MELCHITES, the name given to Christians in Syria and other parts of the East, who, acknowledging the authority of the pope, and the doctrines of the Church of Rome, adhere to the liturgy and ceremonies of the Eastern Church. They conduct divine service in the vernacular tongue, and receive the Lord's Supper in both kinds. Their priests may be married before ordination, but not their bishops. They are chiefly to be found in Aleppo and Damascus. Their patriarch resides at Damascus. The name M. (lit. Royalists) dates from the 5th c.

said, who first taught him to reason, and contain imitations of Pope, Thomson, and In his earlier period, he wrote admirable creontics in praise of student-life; his descriptive poetry is also excellent. His style and manner are simple and natural; and the national are used with singular grace and vigour. His first collection of his verses appeared in 1797, and soon became very popular. Four years before publication, M. V. was appointed a professor at Salamanca, and high political honours even in store for him, but during the French invasion he allowed himself to be cajoled by Murat, at the instigation of Joseph Bonaparte; a weakness which was as disastrous to his prospects as discreditable to his character. When the French were driven out of the Peninsula, the poet was forced to accompany them. He was proscribed as a traitor, and fled to Montpellier, May 1810. M. V.'s Anacreontics are the writings on which his fame rests, and they have procured for him the title of *Restaurador del Parnaso*.

MELIACEÆ, a natural order of plants, containing nearly 200 known species, and shrubs, natives of warm climates, and tropical. Many of the species possess bitter, and tonic properties; some are used as medicine; the seeds of some yield useful oil; some are poisonous; some yield pleasant fruits; the wood of some is valuable. See CARAPA.—The most esteemed fruit of this order next to it is *Milnea edulis*, a fruit of the east of India, of which the edible part is the succulent aril.—The CAPE ASH (*Ekebergia*) deserves notice among the timber trees of the Cape. It has a trunk two feet in diameter, an excellent tough timber, useful for many purposes.—*Melia Azedarach*, a tree about forty feet high, with large bipinnate leaves, a native of Syria and other parts of the East, has long been much valued as an ornamental tree in the south of Europe, and is now common in the southern states of North America. Its flowers are in large, and very fragrant. The fruit is of the shape of a cherry, somewhat elongated, pale yellow, covered with a brown nut. The nuts are bored and strung as beads in Roman Catholic countries, whence it is often called BEAD TREE. It is also known as the GARDEN ALMOND.

inches to a foot or more in diameter. The M. is eaten either by itself, or with sugar, and sometimes with pepper or ginger. The M. can be grown in the open air only in the most southern parts of Britain, and even there requires a hot-bed in spring. Its cultivation in hot-beds is extensively carried on in all parts of Britain, and very great care is bestowed on it. A loamy soil is best suited to it. The setting of the fruit by dusting the female flower with the pollen of the male flower, is constantly practised by gardeners. Warmth and bright sunshine are requisite to the production of fruit of good quality.—The WATER M. or CITRUL (*Cucumis citrullus*), although rarely cultivated in Britain, is highly esteemed and much cultivated in almost all warm countries. It is a native of the warm parts of the old world. It has deeply lobed and gashed leaves, and a large round fruit with smooth dark-green spotted rind, and pink or white flesh, less sweet than the M., but much more juicy or watery, and therefore much prized in many warm countries, not merely as an article of food, but for quenching thirst and allaying fever.—South Africa has another species of WATER M. (*C. Caffer*), very valuable to the inhabitants.—The CHATE (*C. Chate*) is a native of Egypt and Arabia. Its taste is sweet, and as cool as the water melon.—The KAUKOOR (*C. utilis-sinus*) is a native of India, and much cultivated in some parts of that country; it has oval fruit, smooth, variegated with different shades of yellow, and about six inches long, with much the flavour of the melon. The fruit will keep for several months, and is much used both raw and in curries. The half-grown fruit is pickled. The seeds contain much farina and oil, and are ground into meal; the oil is also expressed, and used both for food and in lamps. The seeds of others of this genus may be used in the same way; and they are said to be useful as a diuretic medicine, and for relief of strangury.

MELORIA, a small island in the Mediterranean, about five miles in length and one in breadth, four miles from Leghorn. In 1284, the Genoese gained a famous naval victory over the Pisans in the vicinity of M., by which the latter were deprived of their maritime supremacy. An ancient Pisan tower stands on a rock to the south of Meloria.

MELPO'MENE (the Singing One), one of the nine Muses, specially invoked as the muse of Tragedy.

MELROSE, a pleasant village at the foot of the Eildon Hills, on the south bank of the Tweed, having a population of 1405 at the census of 1871. It is famous for the ruins of its noble Cistercian abbey, founded by King David I. in 1136. The original pile having been destroyed during the Wars of the Succession, the monastery began to be rebuilt about 1326. The work was helped by large grants from King Robert Bruce, and his son King David II., but proceeded so slowly that it was scarcely finished at the Reformation, in the middle of the 16th century. It was in the Second Pointed style, with one or two approaches to Third Pointed, and was beyond doubt the most beautiful structure of which Scotland could boast in the middle ages. What now remains are the chief portions of the conventual church, measuring 251 feet in length, and some fragments of the cloister, which would seem to have been a square 150 feet deep. The tracery and carvings, cut in stone of singular excellence, are scarcely surpassed by any in England. In the pages of Scott, M. shines with a splendour which its meagre history fails to sustain. Its line of abbots shewed one saint, St Waltheof, the stepson of its royal founder. King Alexander II. chose

his sepulture within its walls; Bruce left it the legacy of his heart; and it gave tombs to that flower of Scottish chivalry, the Knight of Liddesdale, and to his kinsman, the heroic Douglas who fell at Otterburn. But its annals have little else to record. As a seat of piety and learning, its renown is eclipsed by the older and humbler monastery founded by St Aidan, about the middle of the 7th c., and commemorated by the Venerable Bede as the home of Eata, of Boisil, of Cuthbert, and of Drythelm. 'Old Melrose,' as it was called after the 12th c., stood about two miles below the modern abbey, on a beautiful promontory almost encircled by the Tweed. It was burned by Kenneth, king of Scots, in 839, and seems never to have recovered the blow. After it had lain waste for many years, we hear of it about 1073, as giving shelter, for a short season, to a few fugitive monks. All that survived the erection of the later abbey was a chapel dedicated to St Cuthbert, and still famous about the middle of the 15th c. as a resort of pilgrims. The *Chronicon de Mailros*, a series of brief obits and annals from 731 to 1275, has been twice printed, first among the *Quindecim Scriptores Historie Anglicane*, published by Bishop Fell at Oxford in 1684; and again by Mr Joseph Stevenson, for the Bannatyne Club at Edinburgh in 1835. The charters of the new modern abbey were printed by Mr Cosmo Innes at Edinburgh in 1837, for the same society, at the cost of the Duke of Buccleuch, in two sumptuous quartos, with the title of the *Liber S. Marie de Melros*.

MELTON-MOWBRAY, a market-town of England, in the county of Leicester, and 16 miles north-east of the town of that name, on the Eye and its junction with the Wreak, which is navigable to the Soar-Navigation, about 11 miles above the town. Stilton cheese is manufactured, and port-pies are extensively made, chiefly for retail in the London, Manchester, and Leeds markets. In the vicinity are numerous hunting-seats, and the town, with stabling accommodation for 800 horses, is the central rendezvous of the famous Melton Hunt. There are breweries, tanneries, and 5 banks. Pop. (1871) 5011.

MELUN, an ancient town of France, capital of the department of Seine-et-Marne, built on an island and on both banks of the Seine, 28 miles south-east of Paris. The manufactures are cement, bricks, tiles, and hats, and there is a trade in timber, grain, and flour. M., the *Melodunum* of the Romans, was stormed five times during the 9th c. by the Normans, and fell into the hands of the English after a siege of six months, in 1419, and was held by them for ten years. Pop. (1872) 8403.

MELVILLE, the name of an island, a sound, and a peninsula in the north polar regions of America.—The Island is in lat. between 74° 30' and 77° N., long. between 105° 40' and 117° 30' W. Greatest length, 200 miles; greatest breadth, 130 miles. It is separated on the west by Fitzwilliam and Kellet Straits from Prince Patrick Island, the most western island of these regions. In 1819, Lieutenant Parry, who gave its name to M. Island, passed the winter here with his crews, in the vain hope of finding in summer a passage westward to the Pacific.—M. Sound, about 250 miles long by 200 miles broad, extends immediately south-east of M. Island. It communicates with the Arctic Ocean on the west by Banks' Strait, and with Raffen's Bay on the east by Barrow Strait and Lancaster Sound.—M. Peninsula, abutting from the continent of British North America, is bounded on the north by the Fury and Hecla Strait, and connected with the mainland by Rae Isthmus. It is 250 miles in

# MELVILLE—MEMEL.

length by about 100 miles in average breadth. Lat. 5° 10'—69° 50' N., long. 81°—87° W.

**MELVILLE, ANDREW**, an eminent Scottish reformer, was born 1st August 1545, at Baldov, on the banks of the South Esk, near Montrose. He was educated at the grammar-school of Montrose, whence he removed in his fourteenth year to the university of St Andrews. Here he remained four years, and left it with the reputation of being the best philosopher, poet, and Grecian of any young master in the land. He then proceeded to Paris, where he continued his studies for two years. His reputation must have been already considerable, for in his twenty-first year he was chosen Regent in the college of St Marceon, Poitiers, whither he had come, a perfect stranger, to acquire a knowledge of law. Some time afterwards, he proceeded to Geneva, where he was more in his element, both politically and religiously, and where, by the influence of his friend Beza, he was appointed to the chair of humanity in the Academy. He returned to Scotland in 1574, and was, in the course of the same year, appointed Principal of the university of Glasgow, where his scholarship, energetic discipline, and intrepidity of character, exercised a most quickening and elevating influence. When the Regent Morton exclaimed on one occasion: 'There will never be quietness in this country till half a dozen of you be hanged or banished,' M. is said to have replied: 'Tush, man; threaten your courtiers so. It is the same to me whether I rot in the air or in the ground; and I have lived out of your country as well as in it. Let God be praised, you can neither hang nor exile His truth!' In 1580, M. was chosen Principal of St Mary's College, St Andrews. Here, besides giving lectures on theology, he taught the Hebrew, Chaldee, Syriac, and Rabbinical languages. In 1582, he preached the opening sermon before the General Assembly, and boldly 'inveighed against the bloody knife of absolute authority, whereby men intended to pull the crown off Christ's head, and to wring the sceptre out of his hand.' The assembly applauded his intrepidity, drew up a remonstrance in a similar spirit, and appointed M. and others to present it. In less than two years, he was summoned before the Privy Council, on account of a sermon preached at St Andrews. He declined to appear, maintaining that whatever a preacher might say in the pulpit, even if it should be called treason, he was not bound to answer for it in a civil court until he had been first tried in a church court. For this denial of secular jurisdiction he was condemned to imprisonment, but escaped to London, where he remained till the downfall of Mary in the following year. After an absence of twenty months, he returned to Scotland, and resumed his office at St Andrews. He was repeatedly elected Moderator of the General Assembly, and Rector of the university. A remarkable instance of his plain speaking took place at Cupar in 1596. He was heading a deputation to 'remonstrate' with the king. James reminded the zealous remonstrant that he was his vassal. 'Sirrah!' retorted M., 'ye are God's silly vassal; there are two kings and two kingdoms in Scotland: there is King James, the head of this commonwealth; and there is Christ Jesus, the King of the church, whose subject James the Sixth is, and of whose kingdom he is not a king, nor a lord, but a member.' In 1605, M. was called to England to attend the union conference at Hampton Court. Having declined the service in the chapel-royal in a Latin sagram, he was summoned before the English Privy Council, where his temper gave way, and he broke out into a torrent of invective against the Archbishop of Canterbury for encouraging popery

and superstition, profaning the Sabbath, &c. The king, violating every principle of justice, immediately sent him to the Tower, where he remained for more than four years. In 1611, he was released, on the solicitation of the Duke of Bouillon, who wanted his services as a professor in his university at Sedan in France. M., now in his sixty-sixth year, would fain have gone home to Scotland to lay his bones there, but the king would on no account hear of such a thing; and he was forced to spend his old age in exile. M. died about 1622, but neither the date of his death nor the events of his last years are ascertained. See *Life of Andrew Melville* by Dr M'Crie (2 vols. 1819).

**MELVILLE, HERMAN**, an American author, was born in New York, August 1, 1819. At the age of eighteen, he shipped as a common sailor on a voyage to Liverpool; and in 1841, he went again before the mast on a whaling voyage to the Pacific. Ill treated by the captain, he deserted at Nukaheva, Marquesas Islands, and was kept four months as the prisoner of a savage tribe in the Typee Valley, whence he was rescued by an Australian whaler, and taken to Tahiti. After visiting the Sandwich Islands, he shipped on a United States' frigate, and returned to Boston in 1843. In 1846, the first literary result of his adventures was published in *Typee*, a spirited account of his residence in the Marquesas. *Omoo*, a continuation of his adventures in Oceania, appeared in 1847, in which year he married a daughter of Chief-justice Shaw of Massachusetts. *Mardi*, a strange philosophical romance, in 1848, was followed by *Redburn* in 1849; *White Jacket, or the World in a Man-of-War*, 1850; *Moby Dick, or the White Whale*, 1851; *Pierre, or the Ambiguities*, 1852; *The Piazza Tales*, 1856; *The Confidence Man*, 1857; *Israel Potter*, 1860; when he left his farm in Massachusetts, and embarked in a whaling vessel on a voyage round the world.

**MELVILLE, VISCOUNT.** See DUNDAS.

**MEMBERED**, in Heraldry. When a bird has its legs of a different colour from its body, it is said to be membered of that colour.

**MEMBRANA PUPILLARIS**, the name given to a very thin membrane which closes or covers the central aperture of the iris in the fetus during a certain period of gestation, but which disappears in the seventh month.

**MEMBRANE**, in Anatomy. This term is applied to designate those textures of the animal body, which are arranged in the form of laminae, and cover organs, or line the interior of cavities, or take part in the formation of the walls of canals or tubes. The structure and special uses of some of the most important of the animal membranes are noticed in separate articles, such as MUCOUS MEMBRANE, SEROUS MEMBRANE, &c.; and the membranes in which the fetus is enclosed—commonly called the fetal membranes—are described in the article PLACENTA. The membranes which cover and protect the brain and spinal cord are commonly termed *Meninges*, from the Greek word *meninx*, a membrane.

**MEMEL**, a governmental district of Prussia, forming its most northerly boundary towards Russia, and included in the circle of Königsberg. The chief town, Memel, situated in 55° 43' N. lat., and 21° 6' E. long., and lying at the northern extremity of the Kurisches Haff, at its opening into the Baltic, is a well-fortified, active seaport. Pop. (1872) 19,019. It has an excellent large harbour, and is the centre of an active trade in corn, wood, hemp, and amber; the produce of Lithuania and other Russian provinces being brought thither for exportation.

inches to a foot or more in diameter. The M. is eaten either by itself, or with sugar, and sometimes with pepper or ginger. The M. can be grown in the open air only in the most southern parts of Britain, and even there requires a hot-bed in spring. Its cultivation in hot-beds is extensively carried on in all parts of Britain, and very great care is bestowed on it. A loamy soil is best suited to it. The setting of the fruit by dusting the female flower with the pollen of the male flower, is constantly practised by gardeners. Warmth and bright sunshine are requisite to the production of fruit of good quality.—The WATER M. or CITRUL (*Cucumis citrullus*), although rarely cultivated in Britain, is highly esteemed and much cultivated in almost all warm countries. It is a native of the warm parts of the old world. It has deeply lobed and gashed leaves, and a large round fruit with smooth dark-green spotted rind, and pink or white flesh, less sweet than the M., but much more juicy or watery, and therefore much prized in many warm countries, not merely as an article of food, but for quenching thirst and allaying fever.—South Africa has another species of WATER M. (*C. Caffer*), very valuable to the inhabitants.—The CHATE (*C. Chate*) is a native of Egypt and Arabia. Its taste is sweet, and cool as the water melon.—The KAUKOOR (*C. sinensis*) is a native of India, and much cultivated in some parts of that country; it has a smooth, variegated with different shades of green, and about six inches long, with much of the melon. The fruit will keep for some time, and is much used both raw and cooked. The half-grown fruit is pickled. The seeds are ground into much farina and oil, and are grown in lamps. The seeds of others are used in the same way; and the fruit is very useful as a diuretic medicine in stranguary.

**MELORIA**, a small island about five miles in length, and five miles from Leghorn, famous naval victory of M., by which the maritime supremacy stands on a rock.

**MELPOMENE**, nine Muses, Tragedy.

**MELROSE**, Eildon having It is abbey or priory.

his sepulture within its legacy of his heart; and it of Scottish chivalry, the K to his kinsman, the hero Otterburn. But its annals As a seat of piety and by the older and he St Aidan, about the memorated by the Eata, of Boissil 'Old Melrose, stood about a beautiful Tweed. After of it to er

from his into birds. obtained a still transferred at a celebrated colossus, Thebes, on the left or west the name of Memnoneia the Egyptian Greeks to the Thebes, as Diospolis was to Memnoneia, or supposed to have existed at Abydos. The two which is the celebrated vocal M., of the old world—are at a distance of about 18 miles from the Nile. Both are seated on the same rock, and represent the monarch Amenophis III., whose name and titles are on the plinths behind. At the sides of the statue are sculptured the wife and mother of Amenophis III. The height of the statue is about 18 feet high. The height of the colossi appears to have originally been about 25 feet, and they are made of a coarse hard sandstone, or breccia. They are at present known by the soubriquets of Tammy and Shammy, and were originally placed before the propylon of an temple or palace-temple of Amenophis III. in this quarter at Thebes. The easternmost of these colossi is the celebrated vocal statue, distinguished from its companion by having been anciently broken and repaired from the lap upwards with blocks of sandstone, placed horizontally, in five layers. The statue was either injured by Cambyzes, to whom the Egyptian priests ascribed most of the mutilations of the Theban temples, or else thrown down by an earthquake. The peculiar characteristic of this statue was its giving out at various times a sound resembling the breaking of a harp-string or a metallic ring; and considerable difference of

**MEMORY.** This is one name for the great distinctive fact of mind, namely, the power of retaining impressions made through the senses, and of reviving them at after-times without the original impressions, and by mental forces alone. The conditions of power have been already stated (see ASSOCIATION OF IDEAS, HABIT). We shall advert here to some of the arts and devices that have been propounded from time to time, for aiding our recollection in the various kinds of knowledge.

Perhaps the commonest remark on this subject is, that memory depends on Attention, or that the more we attend to a thing, the better we remember it. This is true with reference to any special acquisition: if we direct the forces of the mind upon one point, we shall necessarily give that point the benefit of the concentration, but this does not affect memory as a whole: we merely take power from one thing to give it to another. Memory at large can be improved only by increasing the vigor and freshness of the nervous system, and by avoiding all occasions of exhaustion, undue excitement, and other causes of nervous waste. We may do this by general constitutional means, or by stimulating the brain at the expense of the other functions; this method is, however, no economy in the end. Every man's system has a certain fund of plastic power which may be husbanded, but cannot be materially increased on the whole; the power being greatest in early life, and diminishing with advancing years. If it is strongly drawn upon for one class of positions, we must not expect it to be of equal service for others.

But there may be ways and means of preserving and arranging the matters of our knowledge, to make them retained at a smaller cost of plastic power of the brain. These include the art of teaching, expounding, and educating in

town itself, which is surrounded by an unproductive sandy plain, possesses several good manufactories for the preparation of brandy, soap, linseed-oil, &c., and extensive saw-mills, iron-foundries, and amber and iron works, the last of which are noted alike for their strong cables and their light and elegant cast-iron goods. Ship-building is carried on at M., which owns about 100 ships, and has a good school of navigation; about 1800 vessels annually enter and leave the port, and steam-packets maintain a communication with many of the other Baltic ports. M. was founded in 1253 by the Livonian order of knights; in 1404 it was fortified by the Teutonic Knights. In consequence of a fire in 1854, it has of late years undergone an almost complete renovation, and is now a clean well-built town.

**MEMMINGEN**, a town of Bavaria, near the right bank of the Iller, 42 miles south-west of Augsburg. It is surrounded by a wall, carries on manufactures of woollen, cotton, and linen goods, gunpowder, and iron-ware; the chief part of the trade is in hops, wool, leather, and grain. Pop. (1872) 7215.

**MEMNON**, a celebrated hero, the son of Tithonus and Eos or Aurora, who led to Troy a host of Æthiopians, to support the cause of Troy after the fall of Hector. He was said to be clad in armour made by Hephaestus or Vulcan, and killed Antilochus, son of Nestor, in single combat. He was killed in single combat with Ajax or Achilles. Others suppose he was ruler of the nations between Susa and Troy, or a vassal of the Assyrian monarch Teutamus, who sent him with 10,000 Æthiopians, and as many Susians, to the Trojan war. After his death, his corpse was carried by Aurora to Susa, and buried in the acropolis of that town, Memnoneia; or his ashes, collected in a silver urn, borne to his sister Himera at Paphos, and thence to Paliochis or Paltos; or to the banks of the Belos, near Ptolemais. The river Paphlagonios flowed from his blood, and his companions were changed into birds. But the M. of the older writers obtained a still greater renown by the name being transferred at a later period by the Greeks to a celebrated colossus, seated in the plains of Thebes, on the left or west bank of the Nile; while the name of Memnoneia was applied by the Egyptian Greeks to the sepulchral quarter of Thebes, as Diospolis was to the right or east bank. Memnoneia, or supposed palaces of M., also existed at Abydos. The two statues—one of which is the celebrated vocal M., one of the wonders of the old world—are at a place called Koum-el-Sultan. Both are seated on thrones, and represent the monarch Amenophis III., of the 18th dynasty, whose name and titles are inscribed on the plinths behind. At the sides of the throne are sculptured the wife and mother of the monarch, about 18 feet high. The height of each of these colossi appears to have originally been 60 feet, and they are made of a coarse hard gritstone or breccia. They are at present known by the sobriquets of Tammy and Shammy, and were originally placed before the propylon of an Amenopheion or palace-temple of Amenophis III. in this quarter at Thebes. The easternmost of these colossi is the celebrated vocal statue, distinguished from its companion by having been anciently broken and repaired from the lap upwards with blocks of sandstone, placed horizontally, in five layers. The statue was either injured by Cambyzes, to whom the Egyptian priests ascribed most of the mutilations of the Theban temples, or else thrown down by an earthquake. The peculiar characteristic of this statue was its giving out at various times a sound resembling the breaking of a harp-string or a metallic ring; and considerable difference of

opinion has prevailed as to the reason of the sound, which has been heard in modern times being ascribed to the artifice of the priests striking the sonorous stone of which the statue was composed, the passage of light draught through the cracks, or the sudden expansion of aqueous particles under the influence of the sun's rays. This remarkable quality of the statue is mentioned by Strabo, who visited it in c. 100 B.C.; Aelius Gallus, about 18 B.C.; and upwar inscriptions of Greek and Roman visitors in its legs, record the visits of ancient travellers. The phenomenon, from the 9th year of A.D., to the reign of the Emperor Severus became silent. Amongst other visitors who are recorded are those of the Emperor Hadrian, his wife Sabina; Septimius Severus also a statue, and is conjectured to have rested on the statue. Juvenal mentions it as broken in half, and of it occurs under the Pharaohs or the Ptolemies. The identity of this statue and of M. is established in the gloss upon Manetho, and by Pausanias in the inscriptions.—Besides the mythical historical personages of this name are also mentioned one a Rhodian commander of the mercenary Artabazus in the war against Artaxerxes, who subsequently fled to Macedon, and entering the Persian service, defended Perses Alexander, 336 B.C.; but finally died at the battle of Mitylene, 333 B.C.; the other, a Greek who wrote a history of Heraclea Pontica, in which have been epitomised by Photius.—*Episch. Cycl.* 211; Strabo, xv. 728, xvii. 81; *H. A.*, v. 1; Jacobs, *Die Græber des Memnon*, Hieron, p. 154; Juvenal, xv. 5; Letronne, *Mon. d'Osymandyas*; Wilkinson, *Top.*, p. 33; Vossius, *De Hist. Græc. à Westerman*, Diodor. xvi. 52.

**MEMORY**. This is one name for the distinctive fact of mind, namely, the retaining impressions made through the senses, of reviving them at after-times without the aid of external objects, and by mental forces alone. The conditions of memory have been already stated (see ASSOCIATION OF IDEAS, HABIT). We shall advert here to the arts and devices that have been proposed from time to time, for aiding our recollection in the various kinds of knowledge.

Perhaps the commonest remark on this subject is, that memory depends on Attention, or more we attend to a thing, the better we remember it. This is true with reference to any special position: if we direct the forces of the mind to one point, we shall necessarily give that point the benefit of the concentration, but this does not improve memory as a whole: we merely take power from one thing to give it to another. Memory at all times may be improved only by increasing the vigour and freshness of the nervous system, and by avoiding all occasions of exhaustion, undue excitement, or other causes of nervous waste. We may do this by general constitutional means, or by stimulating the brain at the expense of the other functions; but the method is, however, no economy in the end, for man's system has a certain fund of plastic power which may be husbanded, but cannot be increased on the whole; the power being greater in early life, and diminishing with advancing age. If it is strongly drawn upon for one class of positions, we must not expect it to be of equal service for others.

But there may be ways and means of preserving and arranging the matters of our knowledge, to make them retained at a smaller cost of plastic power of the brain. These include the arts of teaching, expounding, and educating in

## MEMORY—MEMORY, DISEASES OF.

and also certain more special devices commonly known as the arts of Memory, or Mnemonics. A brief account of these last may be given here.

The oldest method of artificial memory is said to have been invented by the Greek poet Simonides, who lived in the 5th c. B.C. It is named the *topical*, or *locality* memory, from the employment of known places as the medium of recollection. As given by Quintilian, it is in substance as follows: You choose a very spacious and diversely arranged place—a large house, for instance, divided into several apartments. You impress on the mind with care whatever is remarkable in it; so that the mind may run through all the parts without hesitation and delay. Then, if you have to remember a series of ideas, you place the first in the hall, the second in the parlour, and so on with the rest, going over the windows, the chambers, to the statues and several objects. Then, when you wish to recall the succession, you commence going over the house in the order fixed, and in connection with each apartment you will find the idea that you attached to it. The principle of the method is, that it is more easy for the mind to associate a thought with a well-known place, than to associate the same thought with the next thought without any medium whatever. Orators are said to have used the method for remembering their speeches. The method has been extensively taught by writers on mnemonics in modern times. Probably, for temporary efforts of memory, it may be of some use; the doubtful point always is, whether the machinery of such systems is not more cumbersome than helpful.

Much labour has been spent on mnemonic devices for assisting in the recollection of numbers, one of the hardest efforts of memory. The principal method for this purpose is to reduce the numbers to words, by assigning a letter for each of the ten ciphers. This method was reduced to system by Gregor von Feinaigle, a German monk, and was taught by him in various parts of Europe, and finally published in 1812. He made a careful choice of the letters for representing the several figures, having in view some association between the connected couple, for more easy recollection. For the figure 1, he used the letter *t*, as being a single stroke; for 2, *n*, as being two strokes combined; 3, *m*, three strokes; 4, *r*, which is found in the word denoting 'four' in the European languages; 5, *l*, from the Roman numeral *L*, signifying fifty, or five tens; 6, *d*, because the written *d* resembles 6 reversed; 7, *k*, because *k* resembles two 7's joined at top; in place of this figure is also used on occasion *g*, *q*, *c* (hard) as all belonging to the guttural class of *k*; 8, *b*, from a certain amount of similarity, also *w*, for the same reason, and sometimes *v*, or the half *w*; 9 is *p*, from similarity, and also *f*, both of which are united in the word *puff*, which proceeds from a *pipe*, like a 9 figure; 0 is *s*, *x*, or *z*, because it resembles in its roundness a grindstone, which gives out a hissing noise like these letters. The letters of the alphabet not employed in representing figures are to be used in combination with these, but with the understanding that they have no meaning of themselves. Suppose, then, that a number is given, say 547; 5 is *l*, 4 is *r*, 7 is *k*; which makes *l r k*; among these letters we insert an unmeaning vowel, as *a*, to make up an intelligible word, *LARK*, which remains in the memory far more easily than the numerical form. In making up the words by the insertion of the unmeaning or *dumb* letters, we should also have regard to some connection with the subject that the number refers to, as, for example, in chronology. Thus, America was discovered in 1492; the letters here are *t*, *r*, *p*, *n*; they may be made into *TO RAPISE*, because that discovery led to rapine by the first

Spaniards. There is, of course, great room for ingenuity in the formation of these suggestive words. Also, a series of numbers may be joined together in some intelligible sentence, which can be easily remembered. Such combinations, however, should be formed once for all in the case of any important series of numbers, as the dates of our sovereigns and other historical epochs. It is too much to expect pupils to construct these felicitous combinations. Feinaigle combined the topical method with the above plan in fixing a succession of numbers in the memory.

Dr Edward Pick, a recent lecturer on mnemonics, has called attention to a peculiar mode of arranging lists of words that are to be fixed in the memory, as the exceptions to grammar rules, &c. He proposes to choose out such words as have some kind of connection with one another, and to arrange them in a series, so that each shall have a meaning in common with the next, or be contrasted with it, or be related to it by any other bond of association. Thus, he takes the French irregular verbs, which are usually arranged in the alphabetical order (which is itself, however, a mnemonic help), and puts them into the following series, where a certain connection of meaning exists between every two: as *sew, sit down, move, go, go away, send, follow, run, shun, &c.* In a case where two words have no mutual suggestiveness, he proposes to find out some intermediate idea that would bring about a connection. Thus, if the words were—*garden, hair, watchman, philosophy*, he would interpolate other words; thus—*garden, plant, hair of a plant—hair; hair, bonnet, watchman; watchman, wake, study—philosophy*; and so on. Of course, the previous method is the one that should be aimed at, as the new words are to a certain extent a burden to the mind. Dr Pick further suggests as a practical hint, in committing to memory, that the attention should be concentrated successively upon each two consecutive members of the series; the mind should pause upon the first and the second, until they have been made coherent; then abandoning the first, it should in the same way attend to the second and the third, the third and the fourth, &c. Of course, if every successive link is in that way made sufficiently strong, the whole chain is secure.

There are various examples of effective mnemonic combinations. The whole doctrine of the syllogism (q. v.) is contained in five lines of Latin verse; as regards amount of meaning in small compass, these lines have never been surpassed, if, indeed, they have been equalled. The versification of the rules of the Latin grammar has the same end in view, but all that is gained by this is merely the help from the association of the sounds of the verse in the ear; in comparison with a topical memory, this might be called a *rhythmical* memory. The well-known rule for the number of days in the different months of the year ('Thirty days hath September,' &c.) is an instance of mnemonic verse.

**MEMORY, DISEASES OF.** Memory, or the power of reproducing mental impressions, is impaired by age, wounds, or injuries to the head or nervous system, fevers, intemperance, and various physical conditions. It is perhaps affected in all kinds of mental derangement, but is in a most signal manner obliterated or enfeebled in *Dementia*. There are, however, examples of recollection surviving all other faculties, and preserving a clear and extensive notion of long and complicated series of events amid the general darkness and ruin of mind. Incoherence owes some of its features to defective or irregular memory. Cases of so marvellous an exaltation and extension of this capacity, as where a whole parliamentary debate could be recalled, suggest the suspicion of unhealthy action. There

appear, however, to be special affections of the faculty. It may be suspended while the intelligence remains intact. Periods of personal or general history may elude the grasp, and even that continuity of impressions which goes far to constitute the feeling of personal identity, is broken up, and a duality or multiplicity of experiences may appear to be conjoined. The converse of this may happen, and knowledge that had completely faded away may, under excitement or cerebral disease, return. There are, besides, states in which this power is partially affected, as in the instances where the numbers 5 and 7 were lost, and where a highly educated man could not retain any conception of the letter F; secondly, where, it appears perverted, recalling images inappropriately, and in an erroneous sequence of order or time, and different from what are desired; and thirdly, where, while the written or printed signs of ideas can be used, the oral or articulate signs are utterly forgotten. All these deviations from health appear to depend upon changes generally of an apoplectic nature in the anterior lobes of the brain.—Crichton on *Mental Derangement*, i. 337; Teuchtersleben, *Medical Psychology*, p. 121.

**MEMPHIS**, a celebrated Egyptian city, situated in the Delta, or Lower Egypt, the ancient capital of the country, called by the Egyptians *Men nefer*, or 'the Good Station;' by the Hebrews, *Moph*; and by the Arabs, *Memf*. It was founded by Menes, the first monarch of the first dynasty, who, according to Herodotus, changed the bed of the Nile, and made an embankment, 100 stadia above M., to protect the new city against inundations. The remains of this bank still exist at Kafr-el Tyat, about 14 miles above Metrahenny, which is the centre of old M., and the site of the temple of Ptah or Hephæsteum. Menes fortified the city, and laid the foundations of the temple. Uchoreus, a later monarch, is also said to have founded M., and introduced the worship of Apis and Epaphus. The site of the city was well chosen, protected alike by the Libyan and Arabian chains of mountains against the river and the incursions of the sand, defending the approach of the country from the incursions of Asiatic nomads, and communicating with the Red Sea and the Mediterranean. The city was composed of two portions—one built of crude bricks; the other, on which was the citadel, of calcareous stone, called the *Leukon Teichos*, or 'White Wall,' which held some of the principal buildings. The palace, built by Menes, was enlarged by his son Athothis, and was always inhabited either by a monarch or his viceroy. Under the Persian rule, it was occupied by the satrap; and by the Greek mercenaries, under the Saite kings. Under Uchoreus, the total circumference was 150 stadia. After the 6th dynasty, the city declined in importance, and was apparently held by the Hykshos after the 13th and before the 18th (1500 B. C.). At this period, M. was ruled by a viceroy, a prince of the blood, and still remained the religious capital of the old worship. It rose again to great importance under the Saite monarchs, about 600 B. C., who restored it, became the seat of a separate monarchy, and was conquered by Sennacherib and his successors. The temples of this city were magnificent, and comprised the Iseum, a large temple of Isis, completed by Amasis II. just prior to Cambyes (525 B. C.); a temple dedicated to Proteus, in the foreign quarter; the temple of the Apis, having a peristyle and court ornamented with figures, opposite the south propyleum of the temple of Ptah, where the sacred bull resided; the Serapeum, or temple of Os or Apis, in the quarter recently discovered by M. Mariette (see **SERAPEUM**); the

Nilometer, removed by Constantine I. to Constantinople, replaced by Julian III. or the Agathangelos; a temple of Ra; and the shrine of the Hathor. Here were the statues of Rameses II., which exists as the fallen colossus, Metrahenny, and others have been discovered by Hekeky in his excavations. These colossi, above 20 feet high, were of Syenitic granite, or of the limestone of Tourah or Mokattam. These temples flourished all their glory till the Persian conquest. Still remarkable was the great necropolis of the city, the centre of which towered the pyramids (PYRAMIDS). During the attempts of the rulers to throw off the Persian rule, M. was an important strategic point. Ochus inflicted injury on this town, having plundered the temples and thrown down the walls after he had driven Nectanebus. Alexander the Great here won the Apis, and his corpse was brought to this city. Ptolemy before it was finally transferred to Alexandria. The first Ptolemies were crowned at the Serapeum. Ptolemy VIII. destroyed the city, as it had so declined after his time as to be a decayed site. It fell with the rest of Egypt under the Roman rule, and afterwards was conquered by Amru Ben Abas (639–640 A.D.); and Fustat and Cairo were built out of its ruins, which were still important in the 13th c., when they were destroyed by Abd-alatif. The few remains of the city are Koum-el-Azyzeh to the north; Metrahenny on the west; and the canal of Bedrachin to the south; but the remains here are submerged 10 feet in the soil of the Delta.

Herod. ii. 97, 101, 147, 178; Diod. xviii. 46, Fragm. t. 33, lvi. p. 184; Thucyd. i. 104; xiv. 90; Heliod. ii. 59, 61; Hosea ix. 6; Isa. 30; Ezek. xxx. 13, 16; Wilkinson, *Top. of Egypt*, p. 340; Bunsen, *Egypt's Place*, ii. p. 47; Champollion, *L'Egypte*, 35, 63, 205, 286; Lepsius, 20, 51, 63.

**MEMPHIS**, a city and port of entry on the west side of the Mississippi River, in the south-west corner of Tennessee, United States of America, 10 miles below St Louis. It is handsomely built on a bluff, 60 feet above the highest floods. It is the outlet of a large cotton region, exporting 25,000 bales per annum. It has fine public buildings and a theatre, 11 churches, 2 medical colleges, and 1 weekly newspaper, 4 banks, and several insurance companies, railways connecting it with New Orleans, Charleston, Louisville, and Little Rock. Several foundries, manufactories of boilers, machinery, &c. In the War of Secession, it fell into the hands of the Federal forces after the fall of No. 10 in 1862, and was the base of military operations for the capture of Vicksburg, July 4, 1863. Pop. in 1860, 22,625; in 1870, 40,226.

**MENADO**, an important possession of the Netherlands, on the north of Celebes, formerly a residency under the government of the Moluccas, separated from the Ternate Islands by the Molucca Strait. The country is volcanic, many of the mountains rising to a great height. The mountain grounds of the province of Minahassa are adapted for the growth of coffee, which was planted in 1820, and speedily became famous in the market. The coffee-culture is compulsory, and the produce is monopolised by the government at a fixed price, which, in 1860, was 19s. 3d. the picol (= 132½ lbs. avoirdupois). It seems to have reached its limit, being in 1860 26,965 picols; while in 1860 it had fallen to 19,000. The quantity of rice grown has been 3,000,000 since 1853, as also the value of the important export trade. In this residency, civilisation

Christianity make rapid progress. In 1855, the pagans formed by far the greatest portion of the population; in 1860, the Christians outnumbered them by 15,000. The town of Menado is neatly built, has a church, a school for the children of Europeans, and others for those of natives. Population of the residency, 233,000.

**MENAGE**, **ÆGIDIUS**, or **GILES DE**, a French lexicographer and linguist, was born at Angers in 1613. Disliking the profession of an advocate, he renounced it, along with an office under government, which his father had transferred to him, entered the church, and fixed his residence in the convent of Notre Dame. His time was chiefly spent in literary pursuits, in which he acquired a great reputation. He was an extreme pedant, full of prejudices and bitter hostilities. His *Dictionnaire Étymologique de la Langue Française* (Par. 1650; best ed. by Jault, 2 vols. Par. 1750), and his *Origini della Lingua Italiana*, are erudite and valuable works, although they contain many erroneous etymologies. His poems (Latin, Italian, French, and Greek) are of little worth. He died in 1692.

**MENAI STRAIT**, which separates the island of Anglesey from the mainland, runs east-north-east from its southern extremity to Bangor, a distance of 13 miles, and there widens out into Beaumaris Bay. Its width varies from about 250 yards to 2 miles. The navigation is hazardous, but the strait is nevertheless much used for the sake of expedition by vessels under 100 tons, and occasionally by some of larger size. At the entrance of the strait, the tides sometimes rise to a height of 30 feet, and the ordinary neap-tide rises from 10 to 12 feet. Communication between Anglesey and the mainland was formerly maintained by ferry-boats at different points; but a Suspension Bridge was constructed by government in the line of the great Holyhead road, and subsequently railway communication was established by means of the Britannia Bridge (q. v.). The scenery on both sides of the strait is mildly beautiful.

**MENANDER**, the most celebrated Greek poet of the New Comedy, was born at Athens, 342 B. C. His uncle was the comic poet Alexis; he had Theophrastus for his teacher, and Epicurus for a friend; and the influence of all three is discernible in his style of thought and feeling. M. was a handsome, light-hearted, and elegant Greek, somewhat luxurious, but not impure in his manners. He was drowned while swimming in the harbour of the Piræus. M. wrote more than one hundred comedies, which were in high repute among his countrymen, at least after death; but we possess mere fragments of them. We know something of their character, however, from the imitations of them by Terence. Pleasant and refined wit, clear, sententious reflection, and a vein of real earnestness at times, are the qualities most apparent in them. The best edition of the extant fragments of M. is Meineke's *Fragments Comicorum Græcorum* (Berl. 1841).

**MENCHIKOW**, or **MENCHIKOFF**, **ALEXANDER DANILOVITCH**, a Russian field-marshal and minister of state, was born at Moscow, on 28th November 1672. He was a baker's apprentice, when his intelligent countenance attracted the notice of General Lefort, through whose patronage he was taken into the service of Peter the Great. He had the good fortune to discover a conspiracy among the czar's guards, and his rapid promotion was secured. He accompanied Peter in his travels to Holland and England, and on the death of Lefort, was raised to the post of chief adviser. M. was one of the greatest men of his time, excelling equally as a general and a diploma-

tist; and although totally uneducated, he did much to promote the education of the people, and was a liberal patron of the arts and sciences. On the 30th October 1706, he defeated the Swedes at Kalisch; he contributed to some of the czar's other victories; was made a field-marshal on the field of Pultawa; and compelled Löwenhaupt to capitulate with great part of the Swedish army. In 1710, he took Riga; in 1713, he led the Russian troops into Pomerania and Holstein, and took Stettin, but gave it up to Prussia, contrary to the will of the czar. This and his avarice so displeased Peter, that he subjected him to a court-martial. He was condemned to death by a majority of voices; but was pardoned on payment of a heavy fine. During the reign of Catharine I., he regained his influence at court, and after her death, governed Russia with almost absolute authority in the name of Peter II., whose father-in-law he was just about to become, when he was overthrown by Dolgorouki, and banished to Siberia (September 1727). His immense estates and treasures were confiscated. He died 22d October (2d November) 1729.—His great-grandson, **PRINCE ALEXANDER SERGEJEVITCH M.**, was born in 1789, and after being long an attaché of legation at Vienna, served in the campaigns of 1812–1815, rose to the rank of general, and after the accession of the Emperor Nicholas, was employed both in diplomatic and military services. In the Turkish campaign of 1828, he took Anapa after a short siege, but received so severe a wound before Varna as compelled his retirement. He was afterwards for a time at the head of the Russian navy, and raised it to a high state of efficiency. In March 1853, he was sent as ambassador to Constantinople, where his overbearing behaviour produced a speedy rupture between the Porte and the czar, and brought about the Crimean war. In this war he commanded both the land and naval forces of Russia, and displayed the utmost energy in defending the important fortress of Sebastopol. In March 1855, he was removed from the Crimea, and appointed commander of Cronstadt. M. was, till his death in 1869, one of the most prominent members of the old Russian party.

**MENDE**, a town of France, capital of the department of Lozère, on the Lot, in a valley surrounded by high hills, about 70 miles north-north-west of Montpellier. In the vicinity, are numerous villas and gardens. M. has a cathedral surmounted by two spires, and manufactures serges and other coarse cloths. Pop. (1872) 4833.

**MENDELSSOHN**, **MOSES**, an eminent German philosopher, was born on the 7th September 1729 at Dessau. From his father, a Jewish schoolmaster and scribe, he received his first education; and in his 13th year proceeded to Berlin, where, amid very indigent circumstances, he contrived to learn Latin and modern languages, and to apply himself to the study of philosophy, into which early readings, chiefly of Maimonides's *Moreh Nebuchim*, had initiated him already. After many years of comparative indigence, he became the partner of a rich silk-manufacturer, whose children he had educated. The intimate friend of men like Lessing, Sulzer, Nicolai, he, directly and indirectly, contributed in a vast degree to the extermination of the brutal prejudices against the Jews, and the disgraceful laws with respect to them. On the other hand, he acted in the most beneficial manner on his own co-religionists, by rousing them from the mental apathy with which they regarded in his day all that had not a distinct reference to Religion, and by waging fierce war against their own religious and other prejudices. He was also, on account of his immense influence upon them, called another Moses. He died 4th

January 1786, and Ramler wrote the following epitaph on him: 'True to the religion of his forefathers, wise as Socrates, teaching immortality, and becoming immortal like Socrates.' His principal works are—*Pope, ein Metaphysiker* (with Lessing) (Dan. 1755); *Briefe über die Empfindungen* (Berl. 1764); *Ueber die Evidenz der metaphysischen Wissenschaften*, a prize essay of the Berlin Academy, which thereupon unanimously resolved to elect him a member of their body; Frederick the Great, however, generally prejudiced against the Jews, struck his name off the list; *Phædon, oder über Unsterblichkeit der Seele* (Berl. 1767), a dialogue in the manner of Plato; *Jerusalem, oder über religiöse Macht des Judenthums* (Berl. 1783), chiefly in answer to Lavater's obtrusive, sometimes even offensively worded arguments, by which he intended to convert M. to Christianity, or to prove that he was a Christian already. Further, *Morgenstunden* (Berl. 1785); *Morning Conversations with his children and friends*, chiefly in refutation of Pantheism and Spinozism. Besides many other smaller Hebrew and German essays, contributions to the *Bibliothek der schönen Wissenschaften*, edited by Lessing (to whom, in a manner, he furnished the prototype to his *Nathan der Weise*), &c., his translation of the Pentateuch and the Psalms deserves a prominent place. His works have been collected and edited by G. B. Mendelssohn (Leip. 1843—1845, 7 vols.).

**MEDELSSOHN-BARTHOLDY, FELIX**, a German musical composer, son of Abraham Mendelssohn-Bartholdy, the eminent banker, and grandson of Moses Mendelssohn, the philosopher, was born at Hamburg, 3d February 1809. His father was a convert to Christianity, and young Felix was brought up in the Lutheran faith. The affluent circumstances of his parents enabled them to bestow a most liberal and careful education on their son, whose fine genius early shewed itself. Zelter was his instructor in composition, Ludwig Berger on the piano. In his ninth year, he gave his first public concert in Berlin, and in the following year played in Paris. From this period, he commenced to write compositions of all sorts, some of them of a very difficult character, for the piano, violin, violoncello, &c. In 1824, the first of these—three quartets for the piano—were published. In 1825, he went a second time to Paris—his father, on the advice of Cherubini and other eminent artists, having consented that he should devote himself exclusively to music. He now gave concerts both in Paris and Berlin, after which he travelled for three years in England, Scotland, France, and Italy. In the first of these countries, he obtained enthusiastic applause by his overture to Shakespeare's *Midsummer Night's Dream*, which, in its blending of the fanciful, the delicate, and the grotesque, is said to have caught the inspiration of Shakespeare himself. He afterwards wrote music to accompany the whole of the play. His *Isles of Fingal* are a fine memorial of the impression left upon him by the wild scenery of the Western Highlands. His letters from Italy also shew how profoundly he was affected by that glorious land—the true home of art. M. subsequently attempted to start a musical theatre for the cultivation of high art, at Düsseldorf; but it did not succeed. In 1843, he accepted the directorship of the Leipzig concerts. Here he was in the centre of the musical world of Germany, and was stimulated to his highest and most brilliant efforts; yet it was in England that M. first met with a reception proportionate to his genius. His oratorio of *St Paul*, after being performed at Dresden and Leipzig, was produced under his own management at the Birmingham Festival, September 20, 1837, and

created quite a furor. It and his other oratorio *Elijah*, on which he laboured for nine years, which was first brought out at the Birmingham festival of 1846, are reckoned his two greatest works. He died at Leipzig, November 4. Among his best known compositions are his for Goethe's *Walpurgisnacht*, the *Antigone*, *Edipus* of Sophocles, *Athalie*, and a great number of splendid sonatas, concertos, trios, *Lieder ohne Worte* (Songs without Words), &c. He has achieved a great and novel triumph in character, which was even finer than his genius, charmingly delineated in his *Letters*, which have been translated from the German by Lady V. (London, 1862).

**MENDICANT ORDERS**, certain religious associations in the Roman Church, which carry the principle of religious poverty and self-denial to its fullest extent, make it a part of their profession to denude themselves of all property, whether real or personal, and to subsist upon alms. As the scriptural foundation of this practice is found in the words of our Lord (Matt. xix. 21) to the young man who sought counsel of him, and again (verse 22) to his own disciples, are commonly alleged, but the mendicant orders, and in general by a profession what is called evangelical poverty. Mendicant orders, alms are commonly collected from the lay-brothers; in some, by actual solicitation, others, by the ringing of the convent bell when the stock of provisions is exhausted. Formerly mendicant orders were numerous in the church; but the decree of the second Council of Lyon in 1274 limited mendicant orders were limited to four—the Dominicans, Franciscans, Carmelites, and Augustinians or Austin Friars. See these articles, also *Religious Orders*. The rule by which individuals are denied the possession of even personal property, is strictly observed in Catholic countries. In England and Ireland it was considerably relaxed, but of late years has been enforced with increasing exactness.

**MENDIP HILLS**, a range in the north-west part of Somersetshire, England, extend in a west and south-east direction, and are about 10 miles in length, by from 3 to 6 miles in breadth. In former times, the moors of Mendip were attached to the crown as a royal forest, and were frequently hunted over by the Saxon and Norman kings. A considerable portion of the range is now under cultivation. The summit is Black Down, 1111 ft. in height. The lead and calamine mines of Mendip (called *grooves*, the miners being called *groover*) were in operation before the dawn of history.

**MENDOZA, DON DIEGO HURTADO DE**, a Spanish classic, distinguished also as a statesman and a general, was born at Granada about 1503, studied law at Salamanca; and shortly after leaving the university, was sent by the Emperor Charles V. as ambassador to Venice. Later, he was present at the Council of Trent as imperial plenipotentiary. In 1547 was appointed ambassador to the court of France. As a general, he was successful in driving the French from Siena, which was handed over to Cosimo de' Medici, as a fief of the Spanish crown. His policy, however, was a difficult one; he was hated by pope and people, and in 1554, the emperor recalled him. During his residence in Italy he shewed the greatest zeal in collecting Italian treasures, especially ancient MSS. He sent his men for that purpose to Mount Athos, and also to the advantage of the regard entertained for him by Soliman the Magnificent, Sultan of Turkey. In 1568, an affair of gallantry terminated in his banishment from court. He withdrew to Granada, where he spent his last years in writing his *Guerra*.

## MENDOZA—MENINGITIS.

**Los Moriscos** [History of the War against the Moors—first published (with parts omitted) in 1610, and in a complete form in 1776, by Portalegre, who prefixed a life of the author]. This work is regarded by M.'s countrymen as a masterpiece. M. died in 1575. His library is now one of the ornaments of the Escorial. In his poetical epistles, he gave his country the first good model for that form of composition. His sonnets and serious poems are of inferior merit.

**MENDOZA**, formerly the capital of a department of the same name in the Argentine Republic (q. v.), was situated on the eastern base of the Andes, 10 miles east-north-east of Santiago, and at a height of 2891 feet above sea-level. It was totally destroyed by an earthquake in 1861, when its buildings were demolished, and most of its inhabitants, 15,000 in number, perished.

**MENELA'US**, in ancient Greek legend, was king of Lacedæmon, the younger brother of Agamemnon, and husband of the famous Helen. The abduction of his wife by Paris is represented as the cause of the Trojan war. After the fall of Troy, he was sailed with Helen for his own land; but his fleet was scattered by a storm, and he wandered for eight years about the coasts of Cyprus, Phœnicia, Ethiopia, Egypt, and Libya. After his return, he lived at Sparta with his wife Helen in great style and happiness.

**MENES**, the first king of the first Egyptian dynasty, who built Memphis, made foreign conquests, introduced luxury, and was subsequently devoured by a hippopotamus. During his reign, there was a revolt of the Libyans. His name marks a great chronological epoch, being placed by chronologists 3643, 3892 B. C., or even 5702 B. C. Stricter chronologists make his accession 2717 B. C. This name, which signifies the conductor, has been found on inscriptions, but no contemporary monuments of him are known.—Bunsen, *Egypt's Place*, ii. p. 579; Lepsius, *Königbuch, quellenf.*, p. 5; Böckh, *Manetho*, p. 386; Poole, R. S., *Hor. Egypt*, p. 219.

**MENG-TSE** (i. e., the teacher Meng; earlier, *Meng-ko*; Latinised by the Jesuits into *MENCIUS*), a Chinese sage, born in the beginning of the 4th c. B. C., in the village of Tsou, in the present district of Shan-tung. He died about 317 B. C. M. is the greatest of the early Confucians. His father died while M. was very young; but he was educated with such admirable care by his mother, that the phrase 'mother of Meng' has become a proverb for an excellent preceptress. At this period, China was divided into a number of states, all acknowledging the suzerainty of the emperor of Tseu. M. travelled to several courts, seeking to introduce his doctrines of 'virtue' and 'justice'; but unfortunately, as too frequently happens, he found that princes and great men did not admire these things so much as poor scholars. His conversations with rulers and state-functionaries, with his disciples and acquaintances, were taken down by his admirers. They form the *Hi-tsi*, otherwise called the Book of Meng-tse—the fourth of the Four Books. See *CONFUCIUS*. Many of the thoughts are exquisitely true, suggestive, and subtle. Several translations of it have been published, but they fall far short of the energy, sententiousness, freshness, and vivacity of the original. One of the best is the Latin version of Stanislas Julien, 12 vols. (Paris, 1824). There is also an English one by Collier (Malacca, 1828), and another by Pauthier (Paris, 1851).

**MENGES**, ANTON RAFAEL, a modern German artist and writer on art, was born at Aussig, in

Bohemia, March 12, 1728. His father, Israel Mengs, was himself a painter, but possessed of very mediocre talent, and from him young Rafael received his first instructions in art. At the age of thirteen, he went to Rome, where he remained three years, rigorously devoting his whole time to the study of the works of Michael Angelo, Raphael, and others of the old masters. On his return to Dresden in 1744, he was appointed court-painter to Augustus III., king of Poland and Saxony, but received permission at the same time to go back to Rome. Here he established his reputation by a picture of the 'Holy Family.' The young peasant-girl who sat for the Virgin so charmed the painter by her beauty, that he subsequently passed over to the Roman Catholic Church, and married her. In 1754 he accepted the presidency of the newly instituted Academy of Painting at Rome. Within the next few years, he executed the frescoes in the church of San Eusebio, and those of 'Apollo and the Muses on Parnassus' for Cardinal Albani; besides which, he copied Raphael's 'School of Athens' for Lord Percy, and painted several original pictures in oil, among which may be mentioned a 'Cleopatra,' a 'Holy Family,' and a 'Magdalene.' In 1761, he went to Madrid, on an invitation from Charles III. of Spain, and while there, executed a great variety of works, the best known of which is his 'Aurora'; but ill-health and the intrigues of enemies induced him to return to Italy. He had no sooner arrived, than Clement XIV. employed him on a large allegorical subject for the Vatican Library, representing Janus dictating to History, who appears in the act of writing. After three years, he again visited Spain. To this period belongs his most celebrated effort; it represents the Apotheosis of the Emperor Trajan, and is executed on the dome of the grand saloon in the royal palace at Madrid. Ill-health, however, again forced him to leave Spain. On his way back to Italy, he stopped at Monaco, where he painted his picture of the 'Nativity,' reckoned by many to be his finest piece. Shortly after reaching Rome, he died, 29th June 1779. M.'s works are careful and elaborate imitations of the great masters. He borrowed the technical qualities of a painter in high perfection, but the living soul of genius, the quickening and creative power of imagination was not his. His works, therefore, though lofty in their subjects, seldom exhibit more than a correct and cultivated taste. M.'s writings were edited in Italian by Azara in 1780. There is an English translation (Lond. 1796).

**MENIN**, a frontier town of West Flanders, Belgium, on the left bank of the Lys, which separates it from France, 30 miles south-south-west of Bruges. It was formerly fortified, but its works have been demolished, and it is now a dismal and lifeless town, with some manufactures. Pop. 9640.

**MENINGITIS** (Gr. *mēninx*, a membrane) is the term employed in medicine to designate inflammation of the arachnoid and pia mater (the middle and innermost of the membranes investing the brain).

This disease has been divided into three stages—the symptoms of the first being those of excitement, resulting from inflammation; those of the second being those of compression, shewing that an effusion of fluid into the arachnoid cavity has taken place; while those of the third stage vary according as convalescence or death is the result.

Meningitis is especially apt to occur in children of a tuberculous diathesis, in which case the disease is usually described as acute Hydrocephalus (q. v.). Scarletina, measles, and other diseases caused by a blood-poison, may induce it in children. In adult life, the disease may often be traced to the action of

## MENIPPUS—MENSURATION.

typhous and marsh poisons, to intemperance, sun-stroke, mechanical injuries, &c.

When the disease is due to any of the above-named blood-poisons, or to any constitutional cause, little can be done effectually in the way of special treatment. When it arises from mechanical injuries, bleeding, calomel, active purgatives, and cold applications to the head are often of use. The patient should be kept on low diet, and all mental excitement should be most carefully avoided.

**MENIPPUS**, one of the most noted of the Cynic philosophers, and a pupil of Diogenes, was born at Gadara, in Syria, and flourished in the 1st c. B.C. He was originally a slave, and acquired considerable wealth by usury, but lost it all again; in consequence of which he strangled himself, out of mortification. He satirised the philosophers of his time in terms so severe, that the most biting satires were afterwards designated Menippean. Lucian pronounces him 'the greatest snarler and snapper among all the old dogs' (the Cynics). His works were thirteen in number, according to Diogenes; they are all lost.

**MENISPERMA'CEÆ**, a natural order of exogenous plants, mostly tropical and sub-tropical; creeping and twining shrubs, the wood of which is frequently disposed in wedges, and without the zones usual in exogenous stems. The leaves are alternate, generally simple, destitute of stipules; the flowers small, unisexual, often in large panicles or racemes. There are about 200 known species, including those which by some botanists have been formed into the two small separate orders *Schizandraceæ* and *Lardizabalaceæ*. The true M. are generally bitter and narcotic; some of them are very poisonous, and some are valuable in medicine. See **CALUMBA**, **CISSAMPELOS**, and **COCCULUS**.

**MENNO, SIMONS**, the founder of the later school of Anabaptists (q.v.) in Holland, was born at Witmarsum, in Friesland, in 1496; took orders in 1524, and officiated for some years as a priest, first in the village of Pinjum, and afterwards in his native place. The study of the New Testament, however, about the year 1530, excited grave doubts in his mind regarding the truth both of the doctrine and constitution of the church; and in 1536, he withdrew from it altogether. He now attached himself to the party of the Anabaptists, was rebaptized at Leeuwarden, and appointed a teacher and bishop at Gröningen. Henceforth, his great endeavour was to organise and unite the scattered members of the Anabaptist sect in Holland and Germany. With this design, he spent much time in travelling; but Friesland was his chief residence until persecution compelled him to flee to Wismar. Finally, he settled at Oldeslohe, in Holstein, where he found not only protection, but even encouragement, and was allowed to establish a printing-press for the diffusion of his religious opinions. Here he died in 1561. He was a man of gentle, earnest, modest, and spiritual nature, with no trace about him of the wild fanaticism of the earlier Anabaptists. His book of doctrine, entitled *Fundamentbuch von dem rechten Christlichen Glauben*, was published in 1539. See **ANABAPTISTS**.

**MENOPEME** (*Protonopsis horrida*), one of the largest of batrachians, found in the Ohio and other rivers of the same region, and known on their banks by many names, such as Hellbender, Mud Devil, Ground Puppy, Young Alligator, and Tweeg. In form, it resembles the newt and salamander; the head is flat and broad; the teeth in two concentric rows in the upper jaw, and one row in the lower, numerous and small; it is about two feet long, and

of a slaty gray colour, with dark spots. Notwithstanding its small teeth, it is fierce and voracious, feeding chiefly on fish and batrachians; and

Menopome (*Protonopsis horrida*).

from its habits, partly from its ugliness, is disliked by the fishermen of the Ohio, who usually regard it as venomous.

**MENSTRUATION** is the term applied to the discharge of blood which issues every month from the generative organs of the human female during the period in which she is capable of procreation.

The first appearance of this discharge, to which terms *menses* and *catamenia* (each having reference to the monthly period) are indiscriminately applied, is a decided indication of the arrival of the period of commencing womanhood, and is usually accompanied by an enlargement of the mammary glands and other less important changes. In this case menstruation usually commences between the 12th and the 16th years, and terminates between the 48th and 52d years. The interval which most commonly elapses between the successive appearances of the discharge is about four weeks, although often shorter; and the duration of the discharge is usually three or four days, but is liable to variations. The first appearance of the discharge is usually preceded and accompanied by pain in the loins and general disturbance of the system, and many women these symptoms invariably accompany the discharge. As a general rule, there is no menstrual flow during pregnancy and lactation, a cessation is one of the first signs that conception has taken place.

**MENSURATION**, the name of that branch of mathematics which teaches the application of arithmetic to geometry, and shows how to find, by calculation, the length of a line, the area of surfaces, and the volume of solids. The determination of lines, surfaces, and solids are now under the name of mensuration, and are generally treated of under Trigonometry (q.v.), and surfaces and solids are now under the name of mensuration. A length of a line is expressed by comparing it with some well-known unit of length, such as a foot, an inch, and saying how many such units it contains, so the extent of a surface is expressed by saying how often it contains a corresponding superficial unit, that is a square whose side is a yard, a foot, an inch; and the contents of bodies are similarly expressed in cubes or rectilinear solids having their length, breadth, and depth expressed in units. To find the length of a line (except in cases where the length may be calculated from other known lines, as in trigonometry) we have to apply the unit (in the shape of a foot, a yard measure, a chain), and discover by a trial how many units it contains. But in measuring a surface or a solid, we do not require to apply

## MENTOR—MERCANTILE LAW.

ual square board, or a cubic block, or even to divide it into such squares or blocks; we have only to measure certain of its boundary-lines or dimensions; and from them we can calculate or infer the contents. To illustrate how this is done, suppose that it is required to determine the area of a rectangular figure ABCD, of which the side AB is 7 inches, and the side AC 3 inches. If AC be divided into 3 parts, the points F and E into 3 portions, each 1 inch long, and parallels be drawn from F and E to AB and CD; and if AB be similarly divided into 7 parts, the points G and H into 7 portions, each 1 inch long, and parallels be drawn from G and H to AC or BD through the points of section, then the figure will be divided into a number of equal squares or rectangular figures, whose length and breadth are each 1 inch; and as there are 3 rows of squares, and 7 squares in each row, there must be in all  $7 \times 3$ , or 21 squares. In general terms, if  $a$  and  $b$  be the lengths of two adjacent sides, there are  $a$  rows of the squares, and  $b$  squares in each row. Hence the area of a rectangle = the product of two adjacent sides.

The areas of other figures are found from this, by the aid of certain relations or properties of those figures demonstrated by pure geometry; for instance, the area of a parallelogram is the same as the area of a rectangle having the same base and altitude, and is therefore equal to the base multiplied by the height. As a triangle is half of a parallelogram, the area for its area can be at once deduced. Irregular quadrilaterals and polygons are measured by dividing them into triangles, the area of each of which is separately calculated. For the area of the circle, see CIRCLE. By reasoning similar to what has been employed in the case of areas, it is shewn that the volume of a rectangular parallelepiped or prism is found in cubic inches by multiplying together the length, breadth, and depth in inches; and the oblique parallelepiped, prism, or cylinder, by multiplying the area of the base by the height.

**MENTONE** (Fr. *Menton*), a town in the department of Alpes Maritimes, France. It is pleasantly situated on the shore of the Mediterranean, and from its southern exposure, as well as a high sheltering range of mountains on the north, it enjoys a salubrious and agreeable climate. In its environs are groves of orange, lemon, and olive trees. Lately, M. has become a favourite winter resort for invalids and health loungers from England, Germany, and other countries; and is greatly improved as a place of residence by the addition of numerous hotels, pensions, &c. In 1860, by vote of the inhabitants, M. was detached from the small municipality of Monaco, and annexed to France; the French government paying 4,000,000 of francs to the Prince of Monaco for relinquishing his rights, and according to him certain privileges. M. is within a mile and a half of the Italian frontier on the railway and Corniche road from Nice to Genoa. Pop. (1872) 5540.

**MENTOR**, the son of Alcimus, was the trusted friend of Ulysses, who, on setting out for Troy, left to him the charge of his household, and by him Telemachus was educated. His name became a sort of appellation for an instructor and guide of the young.

**MENU**. See MANU.

**MENU'RA**. See LYRE-BIRD.

**MENZA'LEH**, LAKE, a lake of Egypt, extends east from the Damietta branch of the Nile, and is separated from the Mediterranean by a narrow strip of land, through which, however, there are several penings. It receives the Pelusiac and Tanitic branches of the Nile, and is 37 miles in length, by

about 16 miles in average breadth. Its surface is studded with islands, the most interesting of which is Tenneses, the ancient Tennesus, with Roman remains of baths, tombs, &c. An extensive fishery is carried on on the lake; and its shores abound in wild-fowl. The line of the Suez Canal passes through the eastern portion of Lake Menzaleh.

**MENZEL**, WOLFGANG, an eminent German author, is the son of a medical practitioner, and was born at Waldenburg, in Silesia, 21st June 1798. He studied at Jena and Bonn, was for two years schoolmaster at Aargau in Switzerland, and in 1824 returned to Germany. He first made himself known in the literary world by his *Streckverse* (Heidelb. 1823), a volume replete with poetry and wit, and opening up many novel and ingenious views of art and literature. He then engaged with several coadjutors in a periodical called *Europäische Blätter* (Zür. 1824—1825), in which war was waged against the prevalent heartlessness and formality of German literature, in which he was led to attack vehemently the school of Goethe. This involved him, however, in a controversy with the extreme admirers of that poet. He was afterwards engaged in a succession of controversies, in consequence of opinions expressed by him in his various publications; among which may be noticed his *Geschichte der Deutschen* (3 vols. Zür. 1824—1825, and several editions); *Die deutsche Literatur* (2 vols. Stuttg. 1828, and several editions); *Taschenbuch der neuesten Geschichte* (5 vols. Stuttg. 1829—1833); *Mythologische Forschungen und Sammlungen* (Stuttg. 1842, &c.); and *Geschichte Europas von 1789—1815* (2 vols. Stuttg. 1853). As a poet, he has acquired a high reputation by a volume entitled *Rübezahl* (Stuttg. 1829), and another entitled *Narcissus* (Stuttg. 1830). His *Gesänge der Völker* (Leip. 1851) is a valuable lyrical collection. After the July revolution, he set himself to counteract the French influence that set in strongly among the youth of Germany, whence Börne gave him the nickname of *der Franzosenfresser* ('the Frenchman-eater'). M. has also taken an active part in the political struggles of Germany since 1830.

**MEPPEL**, an important trading and manufacturing town in the Netherlands, province of Drenthe, is situated near the northern boundary of Overijssel. Pop. 7000. It has a great trade in butter, cattle, rye, and buckwheat, being the chief market for a large district of country. The principal manufactures are spinning flax, weaving linens, sail-cloth, and coarse striped woollen fabrics. There are also corn, saw, and oil mills, breweries, &c. The union of several important water-ways with the Meppeller Diep, through which they flow into the Zuider Zee, brings a large shipping-trade to the town.

The moss-land throughout the province of Overijssel produced, in 1862, peat to the value of upwards of £200,000, the greatest part of which is forwarded from M. to Amsterdam and other cities of the Netherlands. M. is about nine centuries old, and has often suffered the evils of war, being favourably situated for receiving a garrison.

**ME'QUINEZ**. See MIKNAS.

**MERCANTILE LAW**. This is the only branch of municipal law which, from the necessity of the case, is similar, and in many respects identical, in all the civilised and trading countries of the world. In determining the relations of the family, the church, and the state, each nation is guided by its own peculiarities of race, of historical tradition, of climate, and numberless other circumstances, which are almost wholly unaffected by the conditions of society in the neighbouring states. But when the arrangements for buying, selling, and transmitting

commodities from state to state alone are in question, all men are very much in the same position. The single object of all is that the transaction may be effected in such a manner as to avoid what in every case must be sources of loss to somebody, and by which no one ultimately is a gainer—viz., *disputes and delay*. At a very early period in the trading history of modern Europe, it was found that the only method by which these objects could be attained was by establishing a common understanding on all the leading points of mercantile, and more particularly of maritime law. This was effected by the establishment of those maritime codes of which the most famous, though not the earliest, was the *Consolato del Mare*. It is sometimes spoken of as a collection of the maritime laws of Barcelona, but it would seem rather to have been a compilation of the laws and trading customs of various Italian cities—Venice, Pisa, Genoa, and Amalfi, together with those of the cities with which they chiefly traded—Barcelona, Marseille, and the like. That it was published at Barcelona towards the end of the 13th c., or the beginning of the 14th, in the Catalan dialect, is no proof that it originated in Spain, and the probability is that it is of Italian origin. As commerce extended itself to the north-western coasts of Europe, similar codes appeared. There was the *Guidon de la Mer*, the *Rôles d'Oleron*, the *Usages de Damme*, and, most important of all, the Ordinances of the great Hanseatic League. As the central people of Europe, the French early became distinguished as cultivators of maritime law, and one of the most important contributions that ever was made to it was the famous ordonnance of 1681, which formed part of the ambitious, and in many respects successful legislation and codification of Louis XIV. See CODE. All these earlier attempts at general mercantile legislation were founded, as a matter of course, on the Roman civil law, or rather on what that system had borrowed from the laws which regulated the intercourse of the trading communities of Greece, perhaps of Phœnicia and Carthage, and which had been reduced to a system by the Rhodians.

From the intimate relation which subsisted between Scotland and the continent of Europe, the lawyers of Scotland became early acquainted with the commercial arrangements of the continental states; and to this cause is to be ascribed the fact that down to the period when the affairs of Scotland were thrown into confusion by the rebellions of 1715 and 1745, mercantile law was cultivated in Scotland with much care and success. The work of Lord Stair, the greatest of all the legal writers of Scotland, is particularly valuable in this department.

In England, the case was very different. After the loss of her French provinces, the legal system of England became wholly insular, and there was no branch in which it suffered more in consequence of being thus cut off from the general stream of European progress than the law-merchant. It was Lord Mansfield who, whether guided by the wider traditions of his original country, or deriving his views from the source from which these traditions sprung, viz., the Roman law, as modified and developed by continental jurisprudence, introduced those doctrines of modern commercial law which English lawyers have since developed with so much acuteness and logical consistency. Many attempts have recently been made to assimilate the commercial laws of England and Scotland, and a commission of lawyers of both countries was recently appointed for the purpose. One of the most important results of their deliberations was the Mercantile Law Amendment Act, 19 and 20 Vict. c. 60.

MERCATOR'S PROJECTION, or MERCATOR'S CHART. See MAP.

MERCHANTS' MARKS. In the middle ages, it was the practice for merchants, traders, and others to whom the proper use of heraldry was not conceded, to be allowed by the heralds to bear devices indicative of their trades or occupations. A cutler might bear his knife, a tailor his shears, a mason his trowel and compasses. These insignia were in strictness ordered to be borne only in 'targets hollow at the chief flanks,' yet we often find them on shields, and sometimes even impaled and quartered with arms. Merchants, along with a monogram of their initials, often bore a mark composed of a cross and a figure resembling the Arabic numeral 4 turned backwards—perhaps a symbol of the Holy Trinity, though it has also been explained to represent the mast and yard of a ship. The insignia of their companies were frequently borne by merchants in a chief above their marks, and occasionally quartered with them. These merchants' marks were probably the origin of the trade brands and marks of our own time. Many of them are to be seen sculptured on the walls and roofs of the churches of the 14th and 15th centuries, and engraved on monumental brasses both in England and on the continent. Seals with merchants' marks are occasionally found appended to conveyances of land.

MERCIA. See HEPTARCHY.

MERCURY. See HERMES.

MERCURY, or QUICKSILVER (symb. Hg, equiv. 100, sp. gr. 13.6), is one of the so-called noble metals, and is remarkable as being the only metal that is fluid at ordinary temperatures. It is of a silvery white colour, with a striking metallic lustre. When pure, it runs in small spherical drops over smooth surfaces; but when not perfectly pure, the drops assume an elongated or *tailed* form, and often leave a gray stain on the surface of glass or porcelain. Moreover, the pure metal, when shaken with air, presents no change upon its surface; while, if impure, it becomes covered with a gray film. It is slightly volatile at ordinary temperatures, and at 662° it boils, and forms a colourless vapour of sp. gr. 6.97. Hence it is capable of being distilled; and the fact of its being somewhat volatile at ordinary temperatures, helps to explain its pernicious effects upon those whose trades require them to come much in contact with it—as, for example, the makers of barometers, looking-glasses, &c. At a temperature of -39°, it freezes, when it contracts considerably, and becomes malleable. In consequence of the uniform rate at which it expands when heated, from considerably below 0° to above 300°, it is employed in the construction of the mercurial thermometer.

All mercurial compounds are either volatilized or decomposed by heat; and when heated with carbonate of soda, they yield metallic mercury. Native or virgin quicksilver only occurs in small quantity, usually in cavities of mercurial ores. Of these ores, by far the most important is *cinnabar* (q. v.). There are two means of obtaining the metal from the cinnabar: the ore may be burned in a furnace, in which case the sulphur is given off as sulphurous acid, and the mercury is collected in a condensing chamber; or the ore may be distilled with some substance capable of combining with the sulphur—as, for example, with slaked lime or iron filings.

The M. imported into this country is usually almost chemically pure. If the presence of other metals is suspected, it may be pressed through leather, re-distilled, and then digested for a days in dilute cold nitric acid, which exerts no action on the M., if more oxidisable metals are

## MERCURY AND MERCURIALS.

The M., after being freed from the nitric washing with water, is chemically pure.

There are two oxides of M., the black suboxide and the red oxide ( $\text{HgO}$ ). Both of these lose their oxygen when heated, and form salts. The black suboxide, although a powerful and very unstable when isolated, being readily reduced by gentle warmth, or even by mere exposure to light, into red oxide and the metal ( $\text{HgO} + \text{Hg}$ ). The most important of its salts is the nitrate ( $\text{Hg}_2\text{O}, \text{NO}_3 + 2\text{Aq}$ ), from whose solution ammonia throws down a black precipitate known in pharmacy as *Mercurius solubilis* (Linn.), from its discoverer, and consisting essentially of the black suboxide with some ammonia. The red oxide, which are apparently in combination with the red oxide, the most important salts are the nitrate ( $\text{HgO}, \text{NO}_3 + 8\text{Aq}$ ); the sulphate ( $\text{O}_8$ ), which is employed in the manufacture of corrosive sublimate; and the basic sulphate ( $\text{SO}_3$ ), which is of a yellow colour, and is called *Purpeth Mineral*.

The chlorides of M. correspond in their composition to the oxides. Of the most important of the chlorides—there are the subchloride, well known as Calomel (q. v.), and the chloride ( $\text{HgCl}$ ), or corrosive sublimate.

The chloride (formerly termed the bichloride, Calomel was regarded as the protochloride, equivalent of Hg was regarded as 200 of 100), when crystallised from a watery solution, occurs in long white glistening prisms; when obtained by sublimation, it occurs in transparent heavy masses, which have a crystalline fracture, and chink with a peculiar metallic sound against the sides of the bottle in which they are contained. This salt melts at  $509^\circ$ , and volatilises unchanged at about  $570^\circ$ . It has an acrid taste. It is soluble in 16 parts of cold, and than three parts of boiling water, and dissolves freely in alcohol and in ether. Corrosive sublimate enters into combination with the alkaline salts, forming numerous distinct compounds. The chloride of ammonium and M., represented by the formula  $3\text{H}_2\text{NCl}, \text{HgCl} + \text{Aq}$ , has been long used as a sal alembroth. It combines with oxide of various proportions, forming a class of compounds of great interest in theoretical chemistry, called *azychlorides of mercury*. On adding a solution of corrosive sublimate to a solution of ammonia, a compound, which, from its physical properties, is termed *white precipitate*, is thrown down, which is generally supposed to be a compound of the amide of M.,  $\text{HgCl}, \text{HgNH}_2$  (Kane).

Corrosive sublimate of M. coagulates albumen, and combines with albuminous tissues generally, forming insoluble compounds. Hence, in cases of poisoning with the salt, the white of raw eggs is used as an antidote; and for the same reason corrosive sublimate is a powerful antiseptic, and is used to preserve anatomical preparations.

Amongst the most important tests for this substance, which is not unfrequently used as a poison, are the following—1. Iodide of potassium, which, added to a crystal or to a watery solution of M., gives rise to the formation of a bright orange-yellow precipitate of mercury. 2. The galvanic test, which may be applied in various ways, of which the most common is the 'guinea and key test,' devised by Lavoisier. He placed a drop of the fluid suspected of being corrosive sublimate on a guinea, and equally touched it and the surface of the coin with an iron key; metallic M. was deposited on the guinea, and a bright silvery stain. 3. Precipitation with copper, and reduction. To apply this test, mix the suspected fluid with a few drops of

hydrochloric acid, and introduce a little fine copper gauze, which soon becomes coated with mercury. On heating the gauze in a reduction tube, the M. is obtained in well-defined globules.

With iodine and bromine, M. forms two iodides and bromides, corresponding in composition to the chlorides. Both the iodides are used in medicine; the bromides are of no practical importance. The subiodide ( $\text{Hg}_2\text{I}$ ) is a green powder formed by triturating 5 parts of iodine with 8 of M., and is of far less interest than the iodide ( $\text{HgI}$ ), which is most simply obtained by precipitating a solution of corrosive sublimate by a solution of iodide of potassium. The precipitate is at first salmon-coloured, but soon changes into a brilliant scarlet crystalline deposit.

Sulphur forms two compounds with M.—viz., a subsulphide ( $\text{Hg}_2\text{S}$ ), a black powder of little importance, and a sulphide ( $\text{HgS}$ ), which occurs naturally as Cinnabar (q. v.). Sulphide of M. is thrown down as a black precipitate by passing sulphuretted hydrogen through a solution of a persalt of M. (corrosive sublimate, for example). When dried and sublimed in vessels from which the air is excluded, it assumes its ordinary red colour. The well-known pigment *vermilion* is sulphide of M., and is sometimes obtained from pure cinnabar, but is more frequently an artificial product.

M. unites with most metals to form Amalgams (q. v.), several of which are employed in the arts.

Of the numerous organic compounds of M., it is unnecessary to mention more than the fulminate (described in the article FULMINIC ACID, q. v.) and the cyanide ( $\text{HgCy}$ ), which may be prepared by dissolving the red oxide of M. in hydrocyanic acid, and is the best source from which to obtain cyanogen.

The uses of M. are so numerous that a very brief allusion to the most important of these must suffice. It is employed extensively in the extraction of gold and silver from their ores by the process of amalgamation. Its amalgams are largely employed in the processes of silvering and gilding, and some (as those of copper and cadmium) are employed by the dentist for stopping teeth. It is indispensable in the construction of philosophical instruments, and in the laboratory in the form of the mercurial bath, &c. It is the source of the valuable pigment vermilion. The use of its chloride in anatomical preparations has been already noticed; it is similarly found that wood, cordage, and canvas, if soaked in a solution of this salt (1 part to 60 or 80 of water), are better able to resist decay when exposed to the combined destructive influence of air and moisture. The uses of M. and its preparations in medicine are noticed in a separate article.

**MERCURY AND MERCURIALS, MEDICINAL USES OF.** Liquid mercury is no longer used in medicine, although, until lately, it was occasionally given with the view of overcoming, by its weight, obstructions in the intestinal canal. There are, however, many preparations which owe their value to *extinguished mercury*; that is to say, to mercury triturated with chalk, saccharoid matters, oil, &c., till globules can no longer be detected in it. It is possible that, in these cases, the metal is partly reduced to the state of suboxide. Amongst these preparations must be placed *Mercury with Chalk*, or *Gray Powder* (*Hydrargyrum cum Creta*), which is the mildest and best mercurial to administer to infants and children, the dose varying with the age; *Blue Pill* (q. v.); and the various ointments, liniments, and plasters of mercury. *Calomel* (termed, in some of the pharmacopœias, *Hydrargyri Chloridum*, for the same reason that corrosive sublimate, as already mentioned, is termed in the

## MERCURY AND MERCURIALS—MERGANSER.

same works *Hydrargyri Bichloridum*) is perhaps more given than any other medicine of this class, and may be regarded, in so far as its actions are concerned, as a type of mercurials generally. Given in small doses, the first effects of these medicines are observed in the increase of the various secretions, as, for instance, of the saliva (see SALIVATION), of the various fluids poured into the intestinal canal,\* and sometimes of the urine. When continued in small doses for some time, they cause the absorption of morbid fluids, and even of morbid products that have assumed a partially solid form. The following are some of the diseases in which they are of most importance: (1), In *internal congestions*, as of the liver, &c., to increase the secretions, and hence relieve the vessels of the affected organ; (2), in various *acute inflammations*, especially of serous Membranes (q. v.), of the structure of the liver and of the lungs, &c.; (3), in numerous forms of *chronic inflammation*; (4), in *dropsies*, dependent upon inflammation of serous membranes or disease of the liver, but not in dropsy from disease of the kidneys, where they are generally injurious; (5), in numerous *chronic affections* in which an alterative action is required; and (6) as a purgative (to be followed by a black draught), when a patient is in the condition popularly known as bilious (in this case, blue pill is usually as efficacious as calomel).

In *syphilis*, mercurials were at one time universally prescribed; now they are not considered essential to the cure of this disease, except in comparatively few cases.

If calomel, blue pill, or any other mercurial be given in too large a dose, or for too long a period, most serious consequences may result—such as, very profuse salivation, with swelling of the tongue and gums, and loosening of the teeth; purging; certain skin affections; disease of the periosteum and of the bones (formerly ascribed to syphilis, but in reality oftener due to the supposed remedy); and a low febrile condition (termed mercurial erythism), accompanied with great general prostration.

The doses of calomel for an adult vary from 3 to 6 grains when taken as a purgative. If the object is to affect the system generally, as in a case of acute inflammation, small doses (half a grain to two grains, combined with a little opium) should be given several times a day; while as an alterative, still smaller doses (not sufficient at all to affect the mouth) should be prescribed. The *Compound Calomel Pill* popularly known as *Plummer's Pill* (in which the calomel is associated with oxysulphide of antimony and guaiacum) is a most valuable alterative in chronic skin-diseases—a five-grain pill to be taken every night.

*Corrosive sublimate* (the *Bichloride* of the pharmacopœias, and *Ozymuriate* of the older chemists), although a very powerful irritant poison, is extremely useful in very small doses as an alterative in many chronic affections of the nervous system, the skin, &c. The dose varies from one-thirtieth to one-eighth of a grain; the average dose of its pharmacopœial solution, the *Liquor Hydrargyri Bichloridi*, being one drachm, which contains one-sixteenth of a grain of the salt. This medicine should always be given on a full stomach.

The above are the chief mercurial preparations that are given internally. Certain external applications require a few remarks. The plasters, ointments, and liniments are absorbed by the skin, and act in the same manner as mercurials taken internally.

*White Precipitate Ointment* is the universal remedy for the destruction of lice, and is a useful stimulating application in chronic skin-diseases. *Ointment of Nitrate of Mercury*, popularly known from its yellow colour as *Citrine*, or *Golden Ointment*, is, when sufficiently diluted, a most useful stimulating application in inflammation of the eyelids, in indolent ulcers, &c.; and the *Ointment of Nitric Oxide of Mercury* is similar in its action. The precipitated suboxide that occurs in *Black Wax*, and its use as a local application, are described in the article LINIMENTS.

The toxicological relations of the mercurial compounds must be briefly glanced at. There are cases on record in which, probably from some peculiarity of constitution, ordinary and even small doses of the milder mercurials have caused death; thus, Christison mentions a case in which two grains of calomel destroyed life by severe salivation and by ulceration of the throat; and similar cases in which small doses of gray powder, blue pill, and calomel have proved fatal, are recorded by Taylor in his *Medical Jurisprudence*. The preparations employed for the purpose of poisoning are mainly corrosive sublimate, and white and red precipitates, corrosive sublimate being used in at least four-fifths of the cases. The symptoms produced by a poisonous dose of this salt come on immediately, there being during the act of swallowing an intense feeling of constriction, and a burning heat in the throat, while a metallic taste is left in the mouth. Violent pain in the stomach and abdomen is felt a few minutes, and vomiting of mucus and blood, and purging, follow. The pulse becomes small, frequent, and irregular, the tongue white and shrivelled, the skin cold and clammy, the respiration difficult, and death is preceded by fainting or convulsions. Any dose exceeding two grains would probably prove fatal to an adult, unless vomiting were induced, or the whites of eggs administered. Death commonly ensues in from one to five days, but may take place in less than half an hour, or not for three weeks or more.

**MERCURY**, *Dog's (Mercurialis)*, a genus of plants of the natural order *Euphorbiaceæ*, having unisexual flowers, a tripartite perianth, 9–12 stamens, two simple styles, and a dry two-celled fruit with two seeds. The species are not numerous. The *Common Dog M.* (*M. perennis*) is very common in woods and shady places in Britain. It has a perfectly simple stem, about a foot high, with rough ovate leaves, and axillary loose spikes of greenish flowers. It turns a glaucous black colour in drying, and the root contains two colouring substances, one blue, and the other carmine, so that it may probably become of importance in dyeing. It is very poisonous. The mercury which some old writers mention as a pot-herb is not this plant, but *Chenopodium Bonus Henricus*.—*Annual Dog M.* (*M. annua*) is a much rarer British plant, and less poisonous. The leaves are indeed eaten in Germany, as spinach.—A half-shrubby species (*M. tomentosa*), found in the countries near the Mediterranean, has enjoyed an extraordinary reputation from ancient times; the absurd belief mentioned by Pliny being still retained, that if a woman after conception drink the juice of the male plant, she will give birth to a boy, and if of the female plant, her offspring will be a girl—the male plant, however, being mistaken for the female, and the female for the male.

**MERGANSER** (*Mergus*), a genus of birds of the family *Anatidæ*, having a slender, straight, much compressed bill, hooked at the tip, and notched at the edges, almost furnished with teeth.

\* It is very doubtful whether, as is generally believed, mercurials increase the secretion of the essential constituents of the bile. The watery portion is undoubtedly, and the colouring matter probably, increased.

# MERGUI—MERINO.

**ILL.** The species are all inhabitants of the west coasts of northern regions, but migrate towards the south in winter. The Goosander (q. v.) is the most common and best known British species. The RED-BELLIED M. (*M. serrator*) is plentiful in the northern parts of Britain, at least in winter, and is found in all the northern parts of the world. It is much smaller than the goosander, which it resembles.—The HOODED M. (*M. cucullatus*), a rarer species, only about 18 inches in entire length, is a very rare visitant of Britain, but is plentiful in North America.

**MERGUI**, a town and seaport of Mergui, one of the Tenasserim Provinces, British Burmah, stands on an island in the delta of the Mergui River. Lat. 1° 50' N., long. 98° 42' E. It is about three miles in extent, and is surrounded by a stockade. Its climate is spacious and secure. Exports: sapan wood, dried fish, ivory, &c. Pop. (1871) 9877.

**MERGUI ARCHIPELAGO**, a group of islands in the Gulf of Bengal, lying off the southern shores of the Tenasserim Provinces, in lat. from 9° to 13° N. The islands are mountainous, some of them rising 900 feet above sea-level. Pearls are found on the coasts of many of them; and edible birds'-nests, which are sold to the Chinese and Malays, as also coral and coal, are among the chief articles of commerce.

**MÉRIDA**, the capital of Yucatan, is situated on a plain, 25 miles from the Gulf of Mexico, in lat. 20° 50' N., long. 89° 40' W. It occupies the site of a former native city, and was founded by the Spaniards in 1542. M. has a university, a cathedral, 13 churches. Its port is Sisal, with which it communicates by a good road. Its trade and resources are not extensive. Pop. 23,575, the body of whom are Indians and half-bloods.

**MÉRIDA** (anc. *Augusta Emerita*), a small, walled town of Spain, in the province of Extremadura, on the right bank of the Guadiana, 32 miles east of Badajoz. It is unique in Spain, and is often pointed a rival of Rome itself, on account of the number and magnitude of its remains of Roman antiquity. The Guadiana is here crossed by a Roman bridge of 81 arches, and with a length of 1,100 feet, and a breadth of 26 feet. It was erected by Trajan. There is another Roman bridge over the river, 450 feet long, and 25 feet wide, quite perfect, in spite of the traffic of 17 centuries. There are also remains of a castle built by the Romans; and among the other most noteworthy monuments of antiquity are an old half-Moorish palace, the Casa de los Corvos, erected out of a temple dedicated to Diana, an aqueduct, an ancient theatre, and a circus. It was built 23 years B.C., and flourished in great splendour, until, in 1229, it was taken from the Moors, after which it began to decline. Pop. 5500.

**MÉRIDEN**, township and village in Connecticut, United States of America, 18 miles north-east of New Haven, containing an academy and several factories. Pop. in 1860, 7426.

**MERIDIAN** (Lat. *meridies*, mid-day), the name of the great circle of the celestial sphere which passes through both poles of the heavens, and through the zenith and nadir of any place on the earth's surface. Every place on the earth's surface has consequently its own meridian. The sky is divided by the polar axis into two equal hemispheres, which stretch from pole to pole, one on each side of the earth. It is mid-day at any place on the earth's surface, when the centre of the sun is upon the meridian of that place; at the same time it is mid-day at all places under the same half

of that meridian, and midnight at all places under the opposite half. All places under the same meridian have therefore the same longitude (see LATITUDE AND LONGITUDE). Stars attain their greatest altitude when they come upon the meridian; the same thing is true approximately of the sun and planets; and, as at this point the effect of refraction upon these bodies is at a minimum, and their apparent motion is also more uniform, astronomers prefer to make their observations when the body is on the meridian. The instruments used for this purpose are called *meridian circles*. See CIRCLE, MERIDIAN.

**MERIDIAN MEASUREMENT.** The determination of the form and size of the earth from the measurement of an arc of a meridian, has been a favourite problem with mathematicians from the earliest times, but up to the middle of last century, their operations were not carried on with exactness sufficient to render their conclusions of much value. Since that time, however, geodesy has so rapidly progressed, owing to the invention of more accurate instruments, and the discovery of new methods, that the measurement of the meridian can now be performed with the utmost accuracy imaginable. The *modus operandi* is as follows: Two stations, having nearly the same longitude, are chosen; their latitude and longitude are accurately determined (the error of a second in latitude introduces a considerable error into the result), and the direction of the meridian to be measured ascertained; then a base line is measured with the greatest accuracy, as an error here generally becomes increased at every subsequent step; and then, by the method known as Triangulation (q. v.), the length of the arc of the meridian contained between the parallels of latitude of the two stations is ascertained. As the previously found latitudes of its two extremities give the number of degrees it contains, the average length of a degree of this arc can be at once determined; and also—on the supposition that the length of a degree is uniform—the length of the whole meridional circumference of the earth. This operation of meridian measurement has been performed at different times on a great many arcs lying between 68° N. lat. and 38° S. lat., and the results shew a steady though irregular increase in the length of the degree of latitude, as the latitude increases. On the supposition that this law of increase holds good to the poles, the length of every tenth degree of latitude in English feet is as in the following table:

Degree of Latitude.	Length of Degree in English Feet.	Degree of Latitude.	Length of Degree in English Feet.
0°	362,732	50°	364,862
10°	362,843	60°	365,454
20°	363,158	70°	365,937
30°	363,641	80°	366,232
40°	364,233	90°	366,361

This result shews that the earth is not spherical, as in that case the length of all degrees of latitude would be alike, but of a more or less spheroidal form—that is, having its curvature becoming less and less as we go from the extremity of its greater or equatorial diameter to the lesser or polar axis. See EARTH. It was by the measurement of a meridional arc that, in 1792–1799, the length of a quadrant of the earth's circumference was determined, in order to form the basis of the French metrical system (see MÈTRE).

**MERINO**, an important breed of sheep, originally Spanish, but now widely diffused throughout Europe, and constituting a great part of the wealth of Australia. The M. has large limbs, and the male

same works *Hydrargyri Bichloridum*) is perhaps more given than any other medicine of this class, and may be regarded, in so far as its actions are concerned, as a type of mercurials generally. Given in small doses, the first effects of these medicines are observed in the increase of the various secretions, as, for instance, of the saliva (see SALIVATION), of the various fluids poured into the intestinal canal,\* and sometimes of the urine. When continued in small doses for some time, they cause the absorption of morbid fluids, and even of morbid products that have assumed a partially solid form. The following are some of the diseases in which they are of most importance: (1), In *internal congestions*, as of the liver, &c., to increase the secretions, and hence relieve the vessels of the affected organ; (2), in various *acute inflammations*, especially of serous Membranes (q. v.), of the structure of the liver and of the lungs, &c.; (3), in numerous forms of *chronic inflammation*; (4), in *dropsies*, dependent upon inflammation of serous membranes or disease of the liver, but not in dropsy from disease of kidneys, where they are generally injurious; (5) numerous *chronic affections* in which an alterative action is required; and (6) as a purgative followed by a black draught, when a patient is in the condition popularly known as bilious case, blue pill is usually as efficacious as

In *syphilis*, mercurials were at one time essentially prescribed; now they are rarely essential to the cure of this disease, except in comparatively few cases.

If calomel, blue pill, or any other mercurial be given in too large a dose, or for too long a time, the most serious consequences may ensue, such as profuse salivation, with swelling of the mouth, gums, and loosening of the teeth; eruptions on the skin affections; disease of the lungs, &c. In some cases, the bones (formerly called *osteitis*) are affected, and the reality oftener due to the disease than to the use of the mercurials. M. rises into cliffs, is a low febrile condition, and is accompanied with three dangerous symptoms: (1) a low febrile condition; (2) a low febrile condition; (3) a low febrile condition.

The doses of calomel in Wales, although its effects are very different, are 6 grains when the patient is in the height of some of those in which it is to affect the system. The chain comprising the highest part of the mountain, from west to south-east, and its base, is composed of Newidly (2955 feet) and Cader Idris (3260 feet). The county is watered by the Dee, which flows from the east, and by the Mawddach and Mawddach (which reach the sea after a south-west course).

The soil of M. is generally poor, and large tracts are unsuitable for profitable cultivation. Of the total area, only 132,310 acres were under crop in 1831, and of this portion 98,124 acres were in permanent pasture. There were 396,915 sheep in the county in 1831. Slate and limestone are largely quarried; and lead and copper is mined; and of late gold has been found in Merioneth. In 1866, there were 529 oz. of gold, and 214 oz. of silver found at Castell Carndochan. Woollens and flannels are manufactured. Chief town, Dolgelley (q. v.).

MERVILLE, JOHN HERMAN, an English scholar and translator, was born at Exeter in 1779, studied at St John's College, Cambridge, and was called to the bar in 1805. He contributed largely to Bland's *Selections from the Greek Anthology*, published in 1813, and brought out a second edition himself in 1833. From 1831 to his death in 1844, he held the office of Commissioner of Bankruptcy. Among his other literary performances may be mentioned *Poems Original and Translated* (1841), and *Minor Poems of Schiller* (1844).—M., the Rev. CHARLES, son of the preceding, was born in 1809, studied at St John's College, Cambridge, where he took his degree in 1830, and was successively scholar, fellow, and tutor. He has acquired a great reputation as

White Precipitate for the destroying application of Nitrate of Silver, yellow colour when sufficient application is made, indolent ulcer Oxide of Mercury precipitated and its use in the art.

has large spiral horns, which do not rise above the head; the skin of the neck is loose and pendulous; the cheeks and forehead bear wool; the fleece is fine, long, soft, and twisted in silky spiral ringlets, abounding in oil, which attracts dust, so that it has

Merino Sheep.

generally a dingy appearance. The fleece is sometimes black, and black spots are apt to appear even in the most carefully bred flocks. The M. sheep fattens slowly, and owes its value altogether to the excellence of its wool. It has not been found profitable in Britain, where the production of mutton is a great part of the object of the sheep-farmer.

**MERINO.** See WOOLLEN MANUFACTURE.

**MERIONETH**, a county of Wales, is bounded on the W. by Cardigan Bay, and on the N. by the counties of Caernarvon and Denbigh. Area, 385,291 acres; pop. (1871) 46,598. The coast immediately south of the town of Harlech rises into cliffs, is skirted by sands, and fringed by three dangerous sandbanks at some distance out to sea. M. is the most mountainous county in Wales, although its peaks do not rise to the height of some of those in Caernarvonshire. The chain comprising the highest peaks runs from north-west to south-east, and its summits are Arran Mowddu (2955 feet) and Cader Idris (q. v.). The county is watered by the Dee, which flows north-east, and by the Mawddach and the Dovey, which reach the sea after a south-west course. The soil of M. is generally poor, and large tracts are unfit for profitable cultivation. Of the total acreage, only 132,310 acres were under crop in 1873; and of this portion 98,124 acres were in permanent pasture. There were 396,915 sheep in the county. Slate and limestone are largely quarried; a little lead and copper is mined; and of late gold has been found in Merioneth. In 1866, there were obtained at Castell Carndochan 529 oz. of gold, and at Vigra and Clogau, 214 oz. Woollens and flannels are manufactured. Chief town, Dolgelley (q. v.).

**MERIVALE**, JOHN HERMAN, an English scholar and translator, was born at Exeter in 1779, studied at St John's College, Cambridge, and was called to the bar in 1805. He contributed largely to Bland's *Collections from the Greek Anthology*, published in 1813, and brought out a second edition himself in 1833. From 1831 to his death in 1844, he held the office of Commissioner of Bankruptcy. Among his other literary performances may be mentioned *Poems Original and Translated* (1841), and *Minor Poems of Schiller* (1844).—M., the REV. CHARLES, son of the preceding, was born in 1809, studied at St John's College, Cambridge, where he took his degree in 1830, and was successively scholar, fellow, and tutor. He has acquired a great reputation as

an author by his *Fall of the Roman Republic* (1859—1865), and *Boyle Lectures* (1864—1865) was installed Dean of Ely in 1869.—Another HERMAN, born in 1805, was appointed Professor of Political Economy at Oxford in 1837, and permanent Under Secretary of State for India in 1859. In the same year he was made C.B. He has written on colonisation.

**MERLE D'AUBIGNÉ**, JEAN HENRI, a Protestant ecclesiastical historian, was born at Eaux-Vives near Geneva in Switzerland, 16th August. He studied there and at Berlin—under Neander—subsequently became pastor of the French Protestant Church in Hamburg. Thence, after a residence of five years, he proceeded to Brussels, he chaplain of King William, who, after the revolution of 1830, invited him to Holland, as tutor to the Prince of Orange. M., however, declined the offer, and returning to Geneva, took part in the institution of a new college for the propagation of orthodox theology, in which he was appointed Professor of Church History. With the exception of some visits to England and Scotland, where he has numerous readers and admirers, he has remained constantly at Geneva. The work which has given him so widespread a reputation is his *Histoire de la Réformation au seizième siècle* (1835, et seq.), which is written with the utmost vivacity, and is at times eloquent. Its popularity has been immense. Among M. D.'s other writings are—*Le Luthère et la Réforme* (Par. 1844); *Germany, England and Scotland* (1848); *Le Protecteur, ou la Réponse d'Angleterre aux Jours de Cromwell* (1848); *Siecles de Lutte en Ecosse* (1850); *Caractères de la Réformation et de la Réformation de Genève*; *Histoire de la Réformation en Europe au Temps de Calvin* (1862—1868). He died at Geneva, 10 October 1872.

**MERLIN** (*Falco aesalon* or *Hypotriorchis*) is the smallest of the British Falconidae, scarcely exceeding a black-bird in size, but very bold, powerful, and possessing all the characters of true falcons, with the distinction of large hexagonal scales on the front of the tarsi. It is of a buff ash colour above; reddish yellow on the breast

Merlin (*Falco aesalon*), Male.

belly, with longitudinal dark spots, the throat of the adult male white. The wings reach to two-thirds of the length of the tail. It builds its nest of

## MERLIN—MEROVINGIANS.

and is fond of localities where large stones are plentiful, on which it is often to be seen perched, and therefore often called the *Stone Falcon*. It is common in most parts of Europe, is found in Asia and North America, and extends southwards to the Cape of Good Hope. It was in great repute in the days of falconry, being very tame, and flying readily at its quarry. It is therefore often used for taking partridges and pigeons. It is a very lively bird, and often utters a harsh scream. It usually flies low and rapidly, threading its way, if necessary, through trees and leaves, but it will also follow its prey mounting upwards to a great height.

**MERLIN**, the name of an ancient Welsh prophet and chanter, who is believed to have flourished in the decline of the native British power in the west with the Saxon invaders. Both the Welsh and the Strathclyde Britons boasted of a prophet who was, in all probability, the same personage, but put out in different legendary guise.—The Welsh Merlin, called *M. Emrys* or *Ambrosius*, is the subject of Geoffrey of Monmouth, in his *Historia Regum Britannie*, to have lived in the 5th c., to have been the result of the intercourse of a demon with a princess, and to have displayed the possession of marvellous powers from infancy. He is alleged to have been the adviser of King Vortigern, and the slayer of Ambrosius, Uterpendragon, and the King Arthur. He is often alluded to by our poets, especially Spenser, in his *Fairy Queen*, and figures in Tennyson's *Idylls of the King*. He has been made the subject of a metrical romance, of which there is a manuscript copy in the Advocates' Library in Edinburgh. (For an analysis of the romance, see Ellis's *Specimens of Early English Metrical Romances*.) A collection of prophecies ascribed to him appeared in French (Paris, 1498), in English (Lond. 1529 and 1533), and in Latin (Paris, 1554); and their existence is traceable at least as far back as the time of the poet Lawrence (1360).—The Strathclyde, or—if we may be allowed an expression which anticipates history—*Welsh* Merlin, called Merlin the Wyllt, or Merlin the Wild, is placed in the 6th c., and appears as a prophetic figure of St Kentigern, Bishop of Glasgow. He is still shewn at Drummelzier on the Clyde, where, in attempting to escape across the river from a band of hostile rustics, he was impaled on a hidden stake. A metrical life of him, extending to more than 1500 lines, professedly based on authentic materials, and incorrectly ascribed to Geoffrey of Monmouth, was published by the Edinburgh Club in 1830. His prophecies—published in 1615—contain those ascribed to the Welsh Merlin.

**MERLON**, in Fortification, is the portion of the ditch between two embrasures. Its length is usually from 15 to 18 feet.

**MERMAID** (i. e., sea-maid), an imaginary inhabitant of the sea. The upper parts of mermaids are represented as resembling those of a human being, usually of a female—although the *Merman* is also sometimes heard of—whilst the body terminates in a fish-like tail. There is an evident affinity between the stories concerning mermaids and those concerning the sirens and tritons, perhaps the nereids, of the ancients. The probability of the origin of these stories have originated in the appearance of seals, walruses, and perhaps still more of the herbivorous cetaceans, in regions where they are not so to persons unaccustomed to see them. Some allowance must be made for the workings of the human imagination, in situations of solitude and darkness, on the unexpected appearance of an

extraordinary and unknown object. Many of the stories concerning mermaids belong to the northern parts of the world, where the herbivorous cetaceans are of rare occurrence, and perhaps some of the solitary seals have often given occasion to them. But the herbivorous cetaceans do occasionally wander into the British, and probably even into more northern seas. Sir James Emerson Tennent says concerning the Dugong (q. v.): 'The rude approach to the human outline, observed in the shape of the head of this creature, and the attitude of the mother while suckling her young, holding it to her breast with one flipper, while swimming with the other, holding the heads of both above water; and when disturbed, suddenly diving and displaying her fish-like tail—these, together with her habitual demonstrations of strong maternal affection, probably gave rise to the fable of the mermaid; and thus that earliest invention of mythical physiology may be traced to the Arab seamen and the Greeks, who had watched the movements of the dugong in the waters of Manar.' It is right, however, that we should bear in mind the possibility of the existence in the ocean of cetaceans not yet known to naturalists.—The mermaid is a not unfrequent heraldic bearing. In the heraldry of France, she is called a Siren, and in Germany she is occasionally furnished with two fishy tails.

**MERMAID'S GLOVE** (*Halichondria palmata*), a sponge pretty common in the British seas, and the largest of British sponges. It grows in deep water, and is sometimes two feet in height. It receives its

Mermaid's Glove (*Halichondria palmata*).

name from the somewhat finger-like arrangement of its branches. It is not slimy, and has a very porous surface; rough, with myriads of minute fragile spicules. Its colour is yellowish.

**MER'ÖE**. See ETHIOPIA.

**MERO'PIDÆ**. See BEE-EATER.

**MEROVINGIANS**, the first dynasty of Frankish kings in Gaul. The name is derived from Merwig or Merovaens, who ruled about the middle of the 5th c., having united a few tribes under his sway. His grandson, Chlodwig or Clovis (q. v.), greatly extended his dominions, and on his death, divided his kingdom among his four sons, one of whom, Chlotar or Clotaire I., re-united them under his own sway in 558. On his death, in 561, the kingdom was again divided into four parts—Aquitaine, Burgundy, Neustria, and Austrasia. His grandson, Clotaire II., again united them in 613; but after his death, in 628, two kingdoms, Neustria and Austrasia, were formed, in both of which the Merovingian kings retained a merely nominal

power, the real power having passed into the hands of the mayors of the palace.—The dynasty of the M. terminated with the deposition of Childeric IV., in 752, and gave place to that of the Carolingians (q. v.), sprung from the Austrasian mayor of the palace.—The chief authority for the earlier parts of the history of the M. is Gregory of Tours. See also Thierry's *Recits mérovingiens* (Par. 1839), and Pertz, *Geschichte der meroving. Hausmeier* (Leip. 1819).

**MERRIMAC**, a river of New England, U.S., rising in New Hampshire, and falling into the Atlantic Ocean at Newburyport, after a course of about 120 miles. It receives several small tributaries, and has numerous falls, affording immense water-power, on the principal of which are the manufacturing towns of Nashua and Manchester, in New Hampshire, and Lowell and Lawrence, in Massachusetts. Navigable 15 miles to Haverhill.

**MERSEBURG**, a town of Prussian Saxony, capital of a circle of the same name, on the Saale, 60 miles south-south-east of Magdeburg. The cathedral, a noble specimen of medieval architecture, is surmounted by four beautiful towers, and has one of the largest organs (with 4000 pipes) in Germany. It contains the monument of Rudolf of Swabia, an aspirant to the imperial title, who was here defeated and slain (1080) by Henry IV.; a bronze plate in low relief, probably the oldest medieval effigy extant. The castle—a picturesque edifice, mostly of the 15th c.—was once a residence of the Saxon princes. Cotton and woollen goods, paper, and tobacco are here manufactured, and bleaching and brewing are carried on. The beer of M. is famous. Pop. (1872) 13,364. It was near this town that the emperor Henry the Fowler gained his famous victory over the Hungarians in 934.

**MERSEY**, an important river of England, separates, in its lower course, the counties of Cheshire and Lancashire, and has its origin in the junction of the Thame and Goyt, on the borders of Derbyshire, east of Stockport. It flows in a west-south-west direction, and is joined on the right by the Irwell from Manchester, at which point it becomes navigable for large vessels. Besides the Irwell, the chief affluents are the Bollin and the Weaver from Cheshire. At its junction with the Weaver, the M. expands into a wide estuary, which forms the Liverpool channel. The estuary is about 16 miles long, and from 1 to 3 miles broad; opposite Liverpool, it is a mile and a quarter in width, with a considerable depth at low water. It is much obstructed by sandbanks; but the excellent system of pilotage in practice here renders the navigation comparatively secure. Congers, shrimps, flounders, and sparlings abound in the river and estuary. Entire length with the estuary, nearly 70 miles.

**MERTHYR-TYDVIL** is a market-town of South Wales, with a population, in 1871, of 51,949 within the parish, which has a local board of health. The parliamentary borough embraces Aberdare and two other outlying districts; pop. 97,020. It is on the northern border of the county of Glamorgan, abutting upon the county of Brecknock, and surrounded by lofty hills. It is built upon the river Taff, 500 feet above sea-level, 24 miles from its mouth and port at Cardiff; and it includes the junctions of the greater and lesser Taff, the Morlais, and the Dowlais, streams which there unite to constitute the main river. M. is the seat of the iron trade of Glamorgan, as represented by the great works of Dowlais, Cyfarthfa, and Plymouth, and in a less degree by that of Pen-y-darren. It also contains large collieries, and is celebrated,

with Aberdare, for the excellence of its steam coal. The annual make of finished iron in this place, chiefly in the shape of rails, merchant-bars, girders, and ship-plates, may be stated roughly at 200,000 tons. The exports of coal are considerable, and are increasing, but the chief consumption is within the works. The population are all directly dependent upon the works, there being no other trade or manufacture. Railways branch from M. to Brecon, to Swansea, to Cardiff and Penarth, and to Newport and Hereford. The borough was created by the first Reform Act, and now returns two members. Its chief town-officer is the headborough of the lordship, called the 'High Constable,' and its government is vested in a Local Board. Dowlais contains some fine public buildings, but M. is deficient in this respect. Though a busy, it is not a striking place, having risen very rapidly with the local trade, and having attained nearly its present dimensions before it was under any but the ordinary parochial government. There are, however, symptoms of improvement. It is well supplied with water, and the infantile mortality, long extraordinary, is now reduced. The people, chiefly Welsh, are industrious, and, on the whole, very orderly. There are 17 established churches, and 113 dissenting chapels in the borough.

**MERTON COLLEGE, OXFORD.** The House of the Scholars of Merton, commonly called M. C., the model of all the secular colleges, was first founded in Maldon in Surrey by Walter de Merton, Bishop of Rochester, and Lord High Chancellor, in 1264, for the maintenance of 20 scholars in the schools of Oxford, and of a warden and three or four ministers of the altar, who were to manage the property. Before 1274, he transferred his warden and ministers to Oxford—thereby not only founding his own college, but contributing in no small degree to fix the university in its present locality. The fellows were to be as many as the means of the house could maintain, and after some changes, this number was fixed by Archbishop Laud at 24. They were to be elected first and chiefly from the founder's kin; but this was from an early period evaded, and the commissioners of 1852 speak of 'a common belief in the university that the elections to fellowships at Merton were formerly determined by personal interest.' In 1380, Dr Wylliot, Chancellor of Exeter, endowed twelve *portionists*, or postmasters as they are now called, equivalent to the scholars of other colleges; and in 1604, John Chamber, fellow of Eton, endowed two more—restricted, however, to foundationers from Eton. By the ordinances under 17 and 18 Vict. c. 81, considerable changes were made—six fellowships were suspended, of which two were assigned to increase the postmasterships, &c., and four to the endowment of the Linacre professorship of physiology, of value £800 per annum. The remaining 18 were thrown open, and not to exceed £250 per annum, exclusive of rooms, until the original number of 24 was restored. The number now being completed, they have reached their limiting value of £300. Sixteen postmasterships, and four scholarships (founded by Henry Jackson in 1753), each of the value of £200 a year, are open without restriction, and tenable for 20 terms from election; but the two postmasterships on the foundation of John Chamber are only to be thrown open in default of candidates from Eton being found duly qualified. This college possesses 18 benefices, to some of which, however, certain other patrons present in turn.

**MERU**, in Hindu Mythology, a fabulous mountain in the centre of the world, 80,000 leagues high. It is the most sacred of all mythical mountains, the

of Vishnu, and endowed with all imaginable

**TURULIDÆ**, or **TURDIDÆ**, a family of birds of the order *Insectores*, sub-order *Dentirostres*, having short and compressed bills, which are pointed and strong, but not strongly. They are regarded by naturalists as intermediate between the *Sylviidæ* (Shrikes, &c.) and the *Sylviadæ* (Warblers). The species are very numerous, and are found in many genera. They are very widely distributed over the globe, some of them being found in some of the warm climates. Some are migratory, a few species are gregarious at all seasons, but most are gregarious only in winter. They generally build their nests in trees. They feed chiefly on soft and vegetable substances, as berries, insects, &c. Many of them are birds of very sweet song, and some are remarkable for their imitative powers.

To this family belong thrushes (among which are reckoned the black-bird, redwing, fieldfare, &c.), orioles, mocking-birds, dippers, &c.

**MESAGNA**, a town of the province of Lecce, in Italy, situated amidst scenery of oriental beauty, 27 miles north-west of Lecce, and surrounded by strong walls. The district around it is fertile, and yields delicious oil, which forms an important article of the trade of Mesagna. Pop.

**EMBRYACEÆ**, or **FICOIDEÆ**, a natural order of exogenous plants, both herbaceous and woody, but all succulent. As defined by some botanists, it includes the orders *Tetragoniaceæ*, *Cecylidæ*, &c., of others. Of the more restricted order 400 species are known, a few of which are of the south of Europe, but none are British; the greater number belong to South Africa and the Indian Sea Islands.—The Ice Plant (*q. v.*) belongs to this order. The leaves of some species, when dried, yield soda in great abundance. Large quantities of barilla are made from them in the Canary Islands, in Spain, and in Egypt. The seeds of some, *embryanthemum crystallinum* (the Ice Plant), *geniculiflorum*, are ground into flour to make bread. *M. geniculiflorum* is used as a pot-herb in some parts of the East.

The fruit of *M. edule* (Hottentot's Fig) is a native of South Africa, and that of *M. aquilare* (the Fig) is a native of Australia.—*M. emarcidum* is called the Hottentot's Fig, who beat and twist up the plant, allow it to ferment, and chew it like bread. When newly fermented, it is narcotic and intoxicating.—Some species of *Mesembryanthemum* are common annuals in flower-gardens in some parts of the East.

**MESENTERY**, **MESENTERIC DISEASE**.—The mesentery derives its name from being connected to the middle portion (Gr. *meson*) of the intestine (*enteron*). It is a broad fold of peritoneum (the great serous membrane of the abdomen), surrounding the jejunum and the ileum, attached posteriorly to the vertebral column, and extending between the intestinal and vertebral columns. Its breadth is about four inches; its attachment to the vertebral column is about six inches in length, and its intestinal border extends from the duodenum to the end of the small intestine. It serves to support the small intestines in their place, while it at the same time allows the necessary amount of movement, and it contains between its layers the mesenteric vessels, the lacteal vessels, and mesenteric glands. These glands are 100 to 150 in number, and are about the size of an almond. They perform an organising action on the contents of the intestine, the chyle being more abundant in fibrine corpuscles after it has passed through them. It is obvious that disease of these glands

must always seriously affect the process of assimilation. The most important affection of these organs is their scrofulous or tubercular degeneration, which gives rise to the disease known as *Tubercles Mesenterici*, a disease most common in childhood, but confined to no period of life. In the great majority of cases, it is associated with, and often marked by, other results of the tubercular or scrofulous diathesis, such as pulmonary consumption, tubercular peritonitis, scrofulous disease of the spine, rickets, &c.; but sometimes the mesenteric glands seem almost exclusively affected, in which case the disease becomes sufficiently distinct to allow of easy detection. The leading symptoms are acceleration of the pulse, occasional fever, especially towards evening, loss of colour and flesh, derangement of the digestive organs (constipation or diarrhoea, and occasional vomiting), a steady pain in the region of the navel, increased by pressure; but perhaps the most characteristic symptom is tumefaction and hardness of the abdomen, with general emaciation. The enlarged glands can sometimes be detected by a careful examination with the hand, especially in advanced cases. The progress of the disease is generally slow, but at length hectic fever sets in, the emaciation becomes extreme, dropsical effusion appears, and the patient dies exhausted, if not cut off by the access of some acute inflammation.

The treatment mainly consists in the administration of cod-liver oil, or, if the stomach is too irritable to bear that medicine, of iodide of potassium, combined with some bitter infusion, the bowels being at the same time carefully attended to. The application of stimulating liniments, or of iodine ointment, to the abdomen is often of great service. When the disease has advanced to a considerable extent, remedies are of little use, except to palliate some of the more urgent symptoms.

Independently of the disease that has just been noticed, inflammation of these glands is by no means uncommon, when the mucous membrane of the small intestine is ulcerated, as, for example, in typhoid or enteric fever.

**MESHDID**, an important city of Persia, capital of the province of Khorassan, in a fertile and well-cultivated plain, on the Tejend, in lat. 36° 17' N., long. 59° 40' E. It is by far the most important town of the north-east of Persia, being the centre of numerous converging routes. The city presents a surprising and beautiful view from a distance. Above the walls, which are of vast circuit, shine the gilded dome of one of the most splendid mosques of the East, the beautiful minarets of the tomb of Imaum Riza, a follower of Ali, and the summits of other sacred buildings. M., as the chief seat of the great sect of the Shiites, is of nearly equal importance with Mecca, the sacred city of the orthodox Mohammedans, and hence it abounds in 'holy' men, arrayed in green turbans and sashes, who instruct the pilgrims visiting the city. The town carries on manufactures of woollen goods and of metal-ware, especially sword-blades, gold work, and articles of jewellery. It is a famous place of pilgrimage, and a centre, to some extent, of education. Caravans arrive almost daily. Pop. 100,000. In the neighbourhood are the ruins of Thus, the old capital of Khorassan, which contains the tomb of the celebrated poet Firdûsi.

**MESILLA**, a town and valley on the Rio Grande, New Mexico, U.S., acquired of Mexico in 1834 by purchase, under the Gadsden treaty. Lat. 32° 17' N., long. 106° 45' W. It is a narrow, but fertile valley, on the southern overland route to California. The town, settled in 1850, had in 1870 a population of 1578.

**MESMER, FRANZ** (according to others, **FRIEDRICH-ANTON**), the founder of the doctrine of Animal Magnetism (q. v.), or Mesmerism, was born in 1733 or 1734, at a village near the Bodensee. He studied at Vienna, and there took the degree of Doctor of Medicine in 1766. About 1772, he began, along with Father Hell, to investigate the curative powers of the magnet, and was led to adopt the opinion, that there exists a power similar to magnetism, which exercises an extraordinary influence on the human body. This he called Animal Magnetism, and published an account of his discovery, and of its medicinal value, in 1775. Honours were conferred upon him in Germany. In 1778, he went to Paris, where he attracted much attention. His system obtained the support of members of the medical profession, as well as of others; but he refused two offers, one of an annual pension of 30,000 livres, and the other of 340,000 livres, to reveal his secret; and this, combined with other circumstances, gave rise to suspicion, and induced the government to appoint a commission, composed of physicians and naturalists, whose report was unfavourable to him. He now fell into disrepute, and after a visit to England, retired to Meersburg, where he spent the rest of his life in complete obscurity. He died March 5, 1815.

**MESMERISM.** See **ANIMAL MAGNETISM**.

**MESNE LORD** is, in English Law, a lord who is himself a tenant to some other lord, called a lord paramount. The phrase is, however, not now used, because subinfeudation was abolished in the time of Edward I.—**MESNE PROCESS** was the name given to writs which issued in respect of a pending action before final judgment was given.—**MESNE PROFITS** are the profits or rents drawn by a person who is wrongfully in possession of real property, and who is afterwards ejected, in which case the mesne profits are recoverable, along with the estate itself.

**MESOPOTAMIA** (Gr. *mesos*, middle, and *potamos*, a river), the region between the Euphrates and the Tigris; but the name is generally applied to the northern part of this region, which is called by the Arabs Al-Jesira (the Island). The northernmost districts of M. are mountainous, being penetrated by the southern spurs of the mountains of Armenia; all the rest is a plain, rarely broken by rocky heights. This plain is dry steppe, green with vegetation only in the wet season; but wherever it is naturally watered, or artificially irrigated, it displays fertility. The inhabitants consist chiefly of Turks, Kurds, Turcomans, and Yesids, with Armenians in the north, and Syrians and Arabs in the plains. The chief occupation of the people is the feeding of cattle; and of the civilisation of ancient times, or even of that which prevailed in a later period (during the Ayubite rule), few or no traces now exist. M. forms a part of the Turkish empire, and is divided into several eyalets or governments. For the history of the country, see **ASSYRIA**, **BABYLONIA**.

**MESOZOIC** (Gr. middle-life), a term introduced by Professor Phillips to designate the group of geological periods, the fossil remains of which differ equally from those of the Palæozoic (ancient-life) and Cainozoic (newer-life) epochs. It is synonymous with the more generally employed term Secondary, and includes the rocks of the Triassic, Oolitic, and Cretaceous periods.

**ME'SPILUS.** See **MEDLAR**.

**MESS** (Fr. *met*, Old Fr. *mes*, Ital. *mezzo*, a dish, from Lat. *missum*, sent, or served up) originally signified a dish or portion of food; but is used in the British army and navy in the sense of a number

or association of officers or of men taking meals together. In societies consisting entirely of the male sex, and of one set of men come thrown together, it is a very important social institution, that the mess should be well regulated. There are consequently stringent rules—both of the conduct and of mutual etiquette—laid down for its government. One officer acts as caterer, receives contributions from the several members, charges the bill to those who drink it, &c.; a steward has charge of the more menial department, arranging the cooking, purchase of viands, servants, rations, &c.

In the navy, the Admiralty lend the plate and glass; in the army, such expenses are met out of a mess fund, which is kept up by a contribution not exceeding thirty days' pay, or difference of the appointment or promotion of an officer, or an annual subscription from each officer not exceeding eight days' pay, which subscription, in the case of subalterns, is, since 1872, paid by the state. Of course, each officer has to pay periodically his share of the general expense for provisions, &c.

In the navy, this expense is limited to £3 a month for the head of the ward-room mess, and £1, 10s. for the gun-room. In the army, there is no specific allowance, but commanding officers are enjoined to observe proper economy. Government assists the regiments serving at home, and on certain stations where the necessities of life are expensive, with an annual allowance of £25 for each company. The whole of this allowance is applied in aid of the cost of the first allowance of wine, and towards reducing the daily expense of the mess, &c. The annual vote for this allowance is about £40,000.

In regiments, there is the officers' mess, to which all the officers of the regiment are bound to subscribe their regulated entrance-fee; but it is optional with married officers to use it or not, and those who elect not to do so, they are exempted from the annual contribution, and only pay for their share of the consumption on the special occasions when they may attend. The sergeants have also a mess, which the commanding officer can succeed in establishing. It is considered necessary for discipline that the messes should be quite exclusive, though, in the case of mental armies, and especially the French, the different, the utmost familiarity being encouraged between all ranks when off duty. The equality of officers and men, due to conscription, and the promotion from the ranks, suffices to account for this difference of system. The sergeants draw *Rations* (q. v.), supplementing them at their own expense; the officers can draw them or not (through their messman), but on foreign stations they invariably do so.

There is no mess for staff-officers with an army, unless they form private arrangements among themselves.

In the British navy, if the ship be small, there is one general mess—the gun-room—to which all the officers must belong. If the vessel have a considerable complement, there is the ward-room mess (of which the captain is not an effective member), in which he dines in his own suite of cabins, for the commander, lieutenants, master, chaplain, paymaster, marine officers, surgeon, assistant-surgeon, and engineer; the gun-room, for sub-lieutenants, masters, midshipmen, cadets, and master's mates; and the engineers' mess (governed by the rules for the gun-room), for engineer officers of the rank of chief-engineer. Officers or men voyaging in a ship of war as passengers are rarely elected honorary members of the mess to which their rank would entitle them. Rations are issued to members of a mess; but each is given

# MESSALINA—MESSIAH.

lieu thereof, an allowance of £1 a month, with the power of purchasing ship's provisions at government rates.

Common seamen and common soldiers, in the navy and army respectively, *mess* together in tables comprising a certain number, according to their ratings or squads; but this has no reference to the technical meaning of *messing* as applied to officers, and is merely for the purpose of economy of fuel and labour in the cooking of their rations.

**MESSALINA, VALERIA**, the daughter of Marcus Valerius Messala Barbatus, and wife of the Roman emperor Claudius, a woman infamous for her lasciviousness, her avarice, and the atrocities which she perpetrated. Taking advantage of the weakness and stupidity of the emperor, she played the adulteress without restraint, and unrelentingly caused all to be put to death who stood in the way of her unhallowed gratifications. The best blood of Rome flowed at her pleasure. Among her victims were the daughters of Germanicus and Drusus, Justus Catonius, M. Vincius, Valerius Maximus, and her confederate Polybius. She went so far in vice as to offer her charms for sale like a common prostitute; and at last, during a temporary absence of the emperor, she publicly married one of her favourites, C. Silius, upon which Narcissus, one of the emperor's freedmen, represented to him that M. was aiming at his destruction, and received orders for her execution. She was put to death by Eodius, a tribune of the guards, in the gardens of Lucullus, 48 A.D. Her name has become a byword for crime and lust.

**MESSENGERS, KING'S (QUEEN'S)**, officers employed by secretaries of state to convey dispatches at home and abroad. In former days, their occupation consisted, to a considerable extent, in serving the secretaries' warrants for the apprehension of persons accused of high treason and other grave offences against the state, nor was it unusual for them to keep the prisoners whom they apprehended at their own houses. They are now principally employed in foreign service.

**MESSENGERS-AT-ARMS**, the officers who execute the process and letters of the Courts of Session and Justiciary in Scotland. They are appointed by, and are under the control of the Lyon King-at-Arms (q.v.). Act 1587, c. 46, contains various provisions regarding these officers, which shew that, prior to that period, the Lyon exercised jurisdiction over them, both as to their admission and the trial of complaints against them. There are a certain number of messengers-at-arms in every county of Scotland, amounting in all, at present, to about one hundred.

**MESSENIA**, a district in the south-west of the Peloponnese, bounded on the E. by Laconia, on the N. by Arcadia and Elis, and on the S. and W. by the sea. It was composed chiefly of extensive plains, watered by the Pamisos and other streams. These plains were famous for their fertility, and particularly for their wheat-harvests. At an early period, after the Doric conquest, it rose to power and opulence. Its chief cities were Messene, Methone, and Pylos. It is chiefly noted for its two wars with Sparta, known as the Messenian Wars, the first of which (according to the common chronology) lasted from 743 to 724 B.C.; and the second from 685 to 668 B.C. In both instances, the Messenians were defeated, and in consequence, a great part of them emigrated to Sicily, where they took possession of Zancle, which then received the name of Messina, the present Messina. After the lapse of 300 years, Epaminondas invited their descendants back to Greece, and they joyfully

responded to his invitation. M. is the name of one of the *nomarchies* of the modern kingdom of Greece.

**MESSIAH** (Heb. *Mashiach*), equivalent to the Greek *Christos*, the Anointed, designates, in the Old Testament, the great deliverer and Saviour, whom the Jews expected to be sent by God, not only to restore their country to the power and splendour which it exhibited in the days of David, but even, by compelling the Gentiles to acknowledge the supremacy of the theocratic people, to raise it to the summit of universal dominion. This large conception, however, first begins to develop itself after the time of Solomon; for the oldest biblical records in their Messianic indications refer rather to the high degree of prosperity which the chosen people were to expect for themselves. This expectation, already visible in the Abrahamic, appeared for a moment to have realised itself in the conquest of Canaan; but the subsequent, and often disastrous wars (in the period of the Judges and of Saul), as well as the internal feuds and dissensions of the Hebrews themselves—left it, in point of fact, unfulfilled. Nevertheless, the hope of the appearance of the M. had rooted itself strongly in the people, and during the glorious and peaceful reigns of David and Solomon, had so grown and enlarged, that even after the secession of Israel, and during the momentous ages that elapsed until its destruction as a kingdom, not only was the hope of a universal world-sovereignty, and of an extraordinary degree of prosperity, warmly cherished, but it was also confidently expected that God would raise up a branch from the stem of David as the M., the founder of the national prosperity, and the bringer-in of the all-embracing theocracy. That branch was declared to be 'the anointed of the Lord,' and since David applied that epithet to himself, the Jews transferred it to the deliverer whom they expected, and called him 'Son of David.' The prophetic writings contain many such allusions to the M., whose coming was expected shortly, and even during the time of the generation then living, whose birthplace, in congruity with his Davidic descent, was announced to be Bethlehem, and who, it was believed, was to be endowed with Divine attributes. These prophetic allusions are commonly termed **MESSIANIC PROPHECIES**. Along with such, the prophets associated the idea of a forerunner (Elijah, Jeremiah, or Moses), whose function was to prepare the people for the appearance of the Messiah. The coming of the Messianic kingdom was to be preceded by a period of severe misfortune and bitter sorrows, the purpose of which was the reconciliation of the people with God (Isaiah i. 25, &c.; Joel iii.; Dan. ix.; Zech. xiii.). These sorrows are called the woes of the M.: they are minutely described in the second book of Esdras—an apocryphal work. Hence sprung up the idea of a suffering M.—widely diffused among the Jews—who, by enduring grief and shame, should make atonement for the people, and reconcile them with God. This conception was greatly strengthened by the picture in Isaiah (chapters lii. and liii.), of a 'servant of God,' which, in fact, is generally regarded as the most distinct prophecy of the Saviour. Hence the step further of considering the M. an offering and sacrifice for the sins of the people, was an easy one; yet, on the other hand, it is singular that no trace of this is found in the Apocrypha, not to mention the popular belief of the Jews, that the M. was to live for ever (John xii. 34), that a crucified Saviour was a stumbling-block to them (1 Cor. i. 23), that even the disciples of Jesus did not comprehend his allusions to his death, and that their faith in him as the M. was for long dim and doubtful. In fact, this popular belief of the Jews was the very reason why they

did not recognise Jesus as the Messiah. In the later Judaism (as it shews itself in the Talmud), the conceptions of the M. are rich in singularities. It was believed that the *true* M., the son of David, would be preceded by another Messiah, a son of Joseph, or Ephraim, who should suffer death for men as a sin-offering. Century after century, the Jews have expected the former, and repeatedly have they risen and placed themselves under the standard of dreamers, fanatics, and impostors, who took to themselves the sacred name; as, for example, BAR-COCHBA (q. v.) in the 2d c.; one Moses in the Isle of Candia, in the 5th c.; one Julian in Palestine, in the 6th c.; several in Persia and Arabia in the 12th c.; and as late as the 18th c., Sabatai Zevi, in Aleppo. Even yet, the hope of a M. is not dead in the hearts of the strict Talmudistic Jews.

The *crucial* question of theology, however, is not the form in which the doctrine (so to speak) of the M. was held by the Jews. All rational students of Scripture, whether 'orthodox' or 'heterodox,' now admit that its growth was gradual, and that it acquired precision and definiteness of outline in the course of ages from its first rude phase, among the pastoral princes of the Syrian wilderness, down to that sublime, yet shadowy personality—the Man of Sorrows—that continually floats before the vision of the 'Younger Isaiah.' The grand question is: Was this doctrine essentially a Divine inspiration, an objective truth of God, or only a lofty conception of the religious soul? The strict rationalistic theologians maintain—and endeavour to prove by an analytic examination of the Gospels—that Jesus assumed the dignity of M., either to accommodate himself to a rooted conception of his countrymen, or partly because he had come to believe it himself—a conclusion, it is said, at which he might arrive quite honestly, since he felt that the *truth* which he taught was the real and only 'kingdom of God,' and that therefore he was justified in applying to himself all that was said (tropically) by the prophetic poets in old times concerning him who should usher in this 'golden age' of the world's faith. The mass of orthodox theologians, on the other hand, regarding the so-called Messianic prophecies of the Old Testament as positive, divinely suggested (perhaps, even on the part of their authors, *conscious*) predictions of Jesus Christ, repudiate the principle of accommodation, or even spiritual application, and try to shew that the Saviour accepted the Messianic prophecies as literally and exclusively applicable to him. The historico-spiritual school, represented in Germany by men like Neander, Rothe, Tholuck, &c., and in England, generally speaking, by the divines of the 'Broad Church' party, occupy a middle position between these two extremes: with the rationalists, they hold that the Old Testament doctrine of the M. was gradually developed, contains many human elements, and does not imply any knowledge of the historical Jesus on the part of those who announce it; with the 'orthodox,' on the other hand, they assert that the doctrine is the expression of a fact, not of a sentiment—that Jesus of Nazareth was actually the Son of God, the appointed M., and that in him the so-called Messianic prophecies were fulfilled in a far higher sense than ever the prophets could have dreamed. It will thus be seen that the rationalists resolve the doctrine of the M. into a merely *subjective* religious idea; while the orthodox, and also the historico-spiritual school of theologians, hold that the doctrine was the expression of a divine fact—the *substance* of a heavenly faith.

MESSINA, a city of Sicily, chief town of the province of same name, one of the most ancient and

most important cities of the island, is situated on the strait of M., encircled by abrupt conical rocks, and commands Calabria. Pop. in 1871, 111,854. The enclosed by old walls, and has several fine and wide lava-paved streets. The harbour is formed by a projecting tongue of land the form of a sickle (whence its primitive Zancle—Gr. sickle—see MESSENIA), is 4 miles in circumference, and can contain a ships; it is defended by a citadel and six depth is sufficient to admit vessels of 12 and the quays are spacious. The trade chiefly in silk, oil, wine, coral, fruits, lime &c., although less extensive than formerly, an important source of wealth to Sicily. imports are cotton and woollen manufactures, and other articles of colonial produce. damasks and satins of M. are excellent, fisheries important. M. has steam-boat communication with Naples, Marseille, and Malta. 15th c., M. was a renowned seat of learning in the 16th c., a famous school of painting founded there by Pelidoro da Caravaggio. modern times, it has undergone terrible tudes, having been ruthlessly bombarded by royal forces on several occasions during its independence in 1848.

MESSINA, STRAITS OF (Ital. *Faro di Lat. Mamertinum fretum*), between Italy and Sicily, are 22 miles in length, and vary from 21 to 24 in breadth. A strong current runs through the strait, which is of great depth. See SCYTHARIAS.

MESSUAGE, the legal term used in England to describe a dwelling-house and piece of land adjoining.

METACENTRE. See HYDROSTATICS. METAL (in Heraldry). The field of a shield and the charges which it bears are metal as well as of colour; and the two use among heralds are gold and silver, known as metal and argent. It is a rule of blazon that metal not be placed on metal, or colour on colour.

METALLURGY is the art of extracting metals from their ores. The operations are mechanical and partly chemical. Those which depend principally on chemical reactions their results have reference chiefly to the and smelting of ores, and are described under the heads of the different metals. But there are preliminary operations of a mechanical kind metallic ores undergo, such as crushing, washing, &c., which we shall describe here as essentially the same for the ores of lead, tin, zinc, and indeed most of the metals. (See that head.)

Ores are first broken up with hammers in a convenient size for crushing or stamping material, such as pieces of rock, spar, &c., which accompany ore, are as far as possible picked out, and the ore itself arranged in sorts according to its purity. Various kinds of apparatus, riddles, sieves, &c., are then used for separating into different sizes, in order to secure a strain on the crushing machinery.

Figs. 1 and 2 represent one of the most common forms of a crushing-mill. The ore is received by means of small wagons, *a*, to the platform where it is ready to be supplied to the rollers *r* through the opening *c*. These rollers are mounted in a strong iron frame, held together by wrought-iron bars, and bolted to strong pillars. Their distance apart is regulated by means of a lever *d*, to which a weight *e* is attached.

## METALS, METALLOIDS.

The variety of machinery and apparatus used in dressing ores is very great, and they pass under different names in different districts, but they are all very similar in principle to those we have described.

**METALS, METALLOIDS.** Although each metal is considered in a separate article, there are various points regarding the general physical and chemical characters of these bodies, and the method of classifying them, which require notice.

It is not easy to define a metal. All the elements are usually divided by chemists into two groups—viz., the non-metallic bodies or metalloids, and the metals; the list of non-metallic bodies containing all those elements in which the characteristic properties of the bodies popularly known as metals (such as silver, gold, iron, &c.) are wanting; these characteristic properties being their metallic lustre, their opacity, and their capacity of conducting heat and electricity. The non-metallic elements are 14 in number—viz., oxygen, hydrogen, nitrogen, sulphur, selenium, tellurium, phosphorus, chlorine, bromine, iodine, fluorine, carbon, boron, and silicon, of which five are gases, one a liquid, and the rest are solids at ordinary temperatures.

The division of the elements into these two great groups is, however, not based upon any definite scientific grounds, and it is still an open question whether some of the metalloids, as, for example, tellurium and silicon, should not be placed amongst the metals. The non-metallic bodies or metalloids being only remarkable as a group for their negative properties, require no special consideration, and we therefore proceed to notice the general properties of the metals.

The following are the most important of the physical properties of the metals.

1. All metals, unless when they are in a finely pulverised form, exhibit more or less of the characteristic lustre termed metallic. Two of the non-metallic elements, iodine and carbon, in some forms, present also a metallic lustre.
2. All metals are good conductors of heat and electricity, although in very unequal degrees.
3. With the exception of mercury, all the metals are solid at ordinary temperatures. With the exception of gold, copper, calcium, and strontium, the metals are more or less white, with a tendency to blue or gray. Most of them have been obtained in crystals, and probably all of them are capable of crystallising under certain conditions.
4. Metals are remarkable for their opacity, and, with the exception of gold, do not transmit light, even when they are reduced to extremely thin leaves.
5. All the metals are fusible, although the temperatures at which they assume the fluid form are very different (see FUSING POINTS); and some of them, as mercury, arsenic, cadmium, zinc, &c., are also volatile.
6. Great weight, or a high specific gravity, is popularly but erroneously regarded as a characteristic of a metal; while platinum, osmium, and iridium (the heaviest bodies known in nature), are more than 20 times as heavy as water, lithium, potassium, and sodium are actually lighter than that fluid.
7. Great differences are observable in the hardness, brittleness, and tenacity of metals. While potassium and sodium may be kneaded with the finger, and lead may be marked by the fingernail, most of them possess a considerable degree of hardness. Antimony, arsenic, and bismuth are so brittle that they may be easily pulverised in a mortar; while others, as iron, gold, silver, and copper, require great force for their disintegration. Taking iron and lead as representing the two extremes of tenacity, it is found that an iron wire will bear a weight 26 times as heavy as a leaden wire of the same diameter. See DUCTILITY, MALLE-

ABILITY. 8. It is a remarkable property of the metals, that none of them are capable of being dissolved without undergoing chemical change. Sulphur, phosphorus, iodine, &c., may be dissolved, and after the evaporation of the solvent, may be re-obtained with all their original properties; but this is never the case with metals.

Amongst the chief chemical properties of metals we next notice:

Their strong affinities to certain of the non-metallic elements. All the metals, without exception, combine with oxygen, sulphur, and chlorine, and often in several proportions, forming oxides, sulphides (formerly termed sulphurets), and chlorides. Many of them combine with bromine, iodine, and fluorine. The other compounds of this nature, excepting carbide (formerly carburet) of iron, or steel, and the hydrides of arsenic and antimony (commonly known as arseniuretted and antimonyuretted hydrogen), which are of importance in toxicology, may be passed over without notice.

The metallic oxides are, without exception, solid bodies, insoluble in water, and usually present a white or coloured earthy appearance. Hence the old name of *metallic calx* for these oxides.

Those oxides which are termed basic possess the property of directly uniting with the so-called organic acids (such as sulphuric, nitric, carbonic, and silicic acid), and of forming a new chemical compound of the second order, termed a *salt* (q. v.).

The compounds of the metals with chlorine, iodine, bromine, and fluorine, such, for instance, as chloride of sodium, or common salt (CINa), are termed Haloid Salts (q. v.). The same metal may often combine both with chlorine and with oxygen in more than one proportion. For example, we have subchloride of mercury ( $\text{Hg}_2\text{Cl}$ ); suboxide of mercury ( $\text{Hg}_2\text{O}$ ); chloride of mercury ( $\text{HgCl}_2$ ); oxide of mercury ( $\text{HgO}$ ). For the compounds of the metals with sulphur, see SULPHURIDES OF THE METALS.

Metals enter into combination with one another when they are fused together, and such combinations are termed *Alloys* (q. v.), unless when mercury is one of the combining metals, in which case, the resulting compound is termed an *amalgam*. It is doubtful whether all alloys are true chemical compounds. Definite compounds of the metals with each other do, however, certainly exist, and are sometimes found native, as, for example, the crystallised silver and mercury compound represented by the formula  $\text{AgHg}_2$ .

In consequence of their strong affinities for the metalloids, the metals are seldom found in a free or uncombined state, even in the inorganic kingdom, and never in animals or plants. The more common metals, in consequence of their strong affinity to oxygen and sulphur, are very rarely met with in the uncombined state; but some of those which are less abundant, such as gold, silver, and platinum, are found uncombined, in which case the terms *native* and *virgin* are applied to them; and other metals, as mercury and copper, occur both in a free and in a combined state. Many native alloys are found, but the ordinary sources of the metals are oxides, sulphides, chlorides, and carbonates, sulphates, and other salts. These are termed the *ores* of the metals. The methods of obtaining the metals from their various ores fall under the head of METALLURGY.

Various classifications of the metals have been suggested by different chemists. The following is probably one of the most convenient:

I.—The *Light Metals*, subdivided into—

1. The metals of the alkalis—viz., potassium, sodium, cesium, rubidium, lithium.

1. The metals of the alkaline earths—viz., barium, calcium, magnesium.

2. The metals of the transition—viz., aluminium, chromium, titanium, zirconium, cerium, thorium, uranium, lanthanum, gadolinium.

3. The Heavy Metals, subdivided into—

1. Metals whose oxides form powerful bases—viz., iron, manganese, chromium, nickel, cobalt, zinc, cadmium, lead, bismuth, copper, uranium, thallium.

2. Metals whose oxides form weak bases or acids—viz., arsenic, antimony, titanium, tantalum, niobium (or columbium), tungsten, molybdenum, tin, vanadium, cerium.

3. Metals whose oxides are reduced by heat—viz., gold, silver, platinum, palladium, iridium, ruthenium, rhodium, osmium. (Several of the rare metals are here omitted.)

Another classification is that by which the M. are arranged in six groups, each group being named after a metal which possesses the common characters in a well-marked degree: viz., (1.) the sodium group; (2.) the calcium; (3.) the iron; (4.) the copper; (5.) the platinum; and (6.) the antimony groups.

**METAMORPHIC ROCKS.** Few of the deposits forming the crust of the earth remain in the condition in which they were deposited. By infiltration of a cementing fluid, by pressure, or by some other inducing agency, sand has become converted into sandstone, and clay and mud into shale. In some strata, this operation has been carried still further. There is a class of rocks, including gneiss, mica-schist, clay-slate, marble, and the like, which, while certainly of aqueous or mechanical origin, have, by intense molecular action, become more or less crystalline. To them, the convenient name Metamorphic (or transformed) Rocks has been given by Lyell.

The Metamorphic Rocks were formerly considered to be the fundamental strata of the earth's crust. The original incandescent mass, it was said, losing its heat by radiation, a solid uneven crust of granite was formed. As soon as the ordinary atmospheric and aqueous agencies began to operate, a disintegration took place, and the abraded materials, carried down by the waters, were deposited in the basins which contained the boiling sea. It was thought that this not only accounted for the condition in which the Metamorphic Rocks now exist, but for the remarkable undulations and contortions so characteristic of these strata. Gneiss and the allied crystalline schists were accordingly placed as the lowest sedimentary strata in a division equivalent to the Palaeozoic Period, and called the Azoic, because they were destitute of organic remains, the conditions in which they were formed being opposed to the existence of animals.

It is now, however, known that Metamorphic Rocks occur as contemporaneous deposits in all epochs of the earth's geological history. In Canada and in the Hebrides, they are of Laurentian age; in the Highlands of Scotland, Cambrian and Silurian; in Devon and Cornwall, Old Red Sandstone and Carboniferous; and in the Alps, Oolitic and Cretaceous, and in some parts even Tertiary. Although deposits of such various ages have been thus altered, the resulting rocks are in structure and composition very similar; their ultimate constituents do not differ from those of ordinary clays and sandstones. In all of them, silica forms the largest proportion, consisting of about 60 to 70 per cent.; alumina follows next, and then other substances in smaller quantities, such as lime, soda, potash, iron, &c. This similarity of composition, and the abundance of clays and sandstones, suggest the supposition that the Metamorphic Rocks may be nothing more than these deposits greatly altered; this is confirmed by many observed instances, in which

aqueous strata are continuous with, and gradually change into, Metamorphic Rocks. The granite of Farnham has intruded itself into the clay and shaly sandstones, brecciating and concretioning the strata. Since some of the shaly rocks have become micaceous; others more indurated, having the characters of mica-slate and gneiss; while others, again, appear converted into a hard-sand rock, strongly impregnated with felspar. In some places in the Eastern Pyrenees, the chalky limestone becomes crystalline and saccharoid as it approaches the granite, and loses all trace of the fossils which it elsewhere contains in abundance. These illustrations tell of changes occurring in the proximity of granite, and it has been consequently somewhat hastily concluded that this rock, coming up in a molten condition from below, has, by the radiation of its heat, produced the metamorphosis. But the observed stratigraphical position of granite, its sometimes passing by insensible degrees into gneiss, and the experiments of Solly and Keyser on its internal structure, shew without doubt that this rock is, at least in many places, an extreme result of metamorphic action, and not the cause of it. To call the energy producing these results metamorphic or molecular action, is simply to hide our ignorance—we get a name, but nothing more. To speak dogmatically on a subject so obscure is a sign of the same ignorance. The following, however, are the most probable agents that, together or separately, produced these remarkable changes:

1. *Heat.*—From whatever source derived, heat does exist, either distributed universally, or occurring locally in the mass of the earth; and where it exists, thermo-electric influences induce action, which, carried on over immense series of years, might produce in the end great changes. It is generally maintained that granite is the result of crystallisation from perfect fusion, and that the strata converted into gneiss must have been reduced to a state of semi-fusion. But we know of crystallisation taking place in the most compact amorphous solids without any approach to fusion, as in the axes of railway-carriages; and of metamorphic action without semi-fusion, as in the highly indurated bottoms of bakers' ovens, in which the clay is subjected to a long-continued though not a great heat; or in the sandstone floor of an iron furnace, which, from long contact with the molten iron, loses its colour, becomes white and hard, and breaks with a porcelanic fracture, having, indeed, been changed into quartz rock. Besides, the frequent occurrence of cavities in the rock crystals of granite containing a fluid which fills them only when the temperature is raised to at least 94° F., shews that the crystal could not have been formed at a higher temperature. We are therefore safe in maintaining, that the heat was not in all cases so great as to produce fusion.

2. *Pressure.*—This alone is sufficient to effect the consolidation and induration of aqueous deposits, converting clay or sand into solid stone. When heat is added to pressure, greater activity is likely to be the result. The undulatory movements of the earth's crust, by carrying down to great depths deposits formed on the surface, bring them under the influence of pressure, heat, and thermo-electricity, and at the same time elevate rocks that have been thus acted upon.

It is thought that heated water may be also a powerful agent, especially when it is subjected to great pressure.

These and other agents, then, operating through immense intervals of time, set in motion chemical attraction, whereby the various substances which entered into the composition of the sedimentary

deposits rearranged themselves as they are found in the Metamorphic Rocks.

The description of the various Metamorphic Rocks will be found under their different names, viz., GNEISS, QUARTZITE, MICA-SCHIST, CLAY-SLATE, and MARBLE.

**METAMO'RPHOSIS** (Gr. change of form) denoted, in the mythology of the ancients, those transformations of human beings into beasts, stones, trees, and even into fire, water, &c., in fables of which that mythology abounded. The origin and significance of such fables it is often impossible to determine. Some of them probably originated in observation of the wonderful transformations of nature; some in a misapprehension of the metaphors employed by the older poets; and some, perhaps, in mere superstition and love of the marvellous. The wild imagination of the Orientals filled their mythologies with metamorphoses in the greatest number; and the classic mythology approaches to them in this respect. They were the theme of some of the poets and other Greek authors of the Alexandrine period, and of Ovid among the Latin classics. The medieval literature of Europe, especially of Germany, in its fairy tales and other forms of folk-lore, is also wonderfully rich in metamorphoses.

**METAMORPHOSIS OF ANIMALS.** This term is applied to changes which certain animals undergo after their escape from the envelope of the egg, and which are of such a nature as essentially to alter the general form or the mode of life of the individual.

The most remarkable metamorphoses occur in the Batrachians, Crustaceans, Insects, and Tape-worms, and are briefly noticed in the articles on those classes of animals. For an excellent general account of the metamorphoses of animals, the reader is referred to a series of articles by De Quatrefages in the *Revue des Deux Mondes* for 1853.

**METAMORPHOSIS OF ORGANS,** in Botany, a subject of so much importance, that it has been exalted to the rank of a distinct branch of botanical science, under the name of *Morphology* or *Vegetable Morphology*. Attention to it is essential to a philosophical study of botany; yet it may almost be said that nothing was known either of its facts or its laws, till the poet Goethe proclaimed them to the world in his treatise entitled *Die Metamorphose der Pflanzen*, in 1790. Linnaeus had, indeed, called attention to the development of organs, and the changes which they undergo, and had made this the subject of a *thesis* entitled *Prolepsis Plantarum* in 1760; but, in a manner very unusual with him, he mixed up with his observations and philosophical speculations certain fanciful suppositions, the falsehood of which soon becoming apparent, caused all the rest to be neglected. Wolff afterwards extricated the true from the fanciful in the views of Linnaeus, and gave them greater completeness; but he introduced the subject only incidentally in a paper on comparative anatomy, which failed to attract the attention of botanists, and probably had never been seen by Goethe, whose discovery, apparently altogether original, is one of the finest instances on record of acute observation combined with philosophical generalisation.

The metamorphosis of organs is noticed in the articles on particular organs. It is only necessary here to make a very general statement of its facts and laws. A plant is composed of the *axis* and its *appendages*; the axis appearing above ground as the stem and branches, below ground as the root; the appendages being entirely above ground, and essentially *leaves*; all organs which are not formed of the

axis being modified leaves. The proof of this consists very much in the gradual transition of one organ into another, manifest in some plants, although not in others; as of leaves into bracts, one of the most frequently gradual transitions; of leaves into sepals, as seen in the leaf-like sepals of many roses, of sepals into petals, as seen in the petal-like sepals of lilies, crocuses, &c.; of petals into stamens, as seen in water-lilies; and even of stamens into pistils, often exemplified in the common house-hold. The proof is confirmed and completed by observation of the monstrosities which occur in plants, particularly in the frequent return of some part of the flower to its original type, the leaf, and in the conversion of one part of the flower into another, which is also the result of cultivation, and is particularly illustrated in *double* flowers, the increase of the number of petals being the result of the conversion of stamens into petals.

A flower-bud being a modified leaf-bud (see *BUD*), and a flower therefore the development of a modified leaf-bud, the parts of a flower correspond in their arrangement with the leaves on a branch. But peculiar laws govern the development of organs in each species of plant. Thus, the leaves in one are opposite; in another, alternate; in another, whorled, all depending on the law which governs the growth of the axis in relation to the development of leaves, which is very constant in each species; and in the manner the parts of the flower are developed in whorls around an abbreviated terminal portion of the axis, the energies of the plant being here directed to the reproduction of the species, and not to the increase or growth of the individual. The pistil itself, being formed from the pistil, is to be regarded as formed of modified leaves. Goethe truly says: 'The pod is a leaf which is folded up and grown together at its edges, and the capsule consists of several leaves grown together; and the compound fruit is composed of several leaves united round a common centre, their sides being opened so as to form a communication between them, and their edges adhering together.'

The metamorphosis of organs has been investigated with great diligence and success, and beautifully elucidated by Miquel, Lindley, Schleiden, and other botanists.

**METAMORPHOSIS OF TISSUE.** See *TISSUE*.

**METAPHOR** (Gr. *metaphora*, a transferring), a figure of speech, by means of which one thing is put for another which it only resembles. Thus, the Psalmist speaks of God's law as being 'a light to his feet and a lamp to his path.' The metaphor is therefore a kind of comparison, in which the speaker or writer, casting aside the circumlocution of the ordinary similitude, seeks to attain his end at once, by boldly identifying his illustration with the thing illustrated. It is thus of necessity, when well conceived and expressed, graphic and striking in the highest degree, and has been a favourite figure with poets and orators, and the makers of proverbs, in all ages. Even in ordinary language the meanings of words are in great part metaphors; as when we speak of an *acute* intellect, or a *bold* promontory.

**METAPHYSICS**, a word of uncertain origin, but first applied to a certain group of the philosophical dissertations of Aristotle (see *ARISTOTELIAN*). As since employed, it has had various significations, and more especially two—a larger and a more confined. In the more confined sense, it is allied to the problems of the Aristotelian treatise, and is concerned with the ultimate foundations of our knowledge of existing things. What is the nature of our knowledge of the external world, seeing that we cannot properly know what is not in contact with

itself? has been asked by philosophers, and answered in various ways; and this is the great question of metaphysics (see PERCEPTION, COMMON SENSE). The name 'Ontology' has been applied to the same inquiries into our cognizance of existences out of ourselves. But as the solution of this difficult question was found to involve an investigation into the nature of the human mind, it became allied with the science whose object it is to describe fully and systematically the laws and properties of our mental constitution—a science called by the various names of Psychology, Mental Philosophy, Moral Philosophy; and hence Metaphysics came to be an additional name for this more comprehensive department. The word is employed at the present day by writers of repute in both meanings. Thus, Ferrier's *Institutes of Metaphysic* is occupied solely with the questions connected with knowledge, or the nature of our perception of an external world; his explanatory title is, *The Theory of Knowing and Being*. On the other hand, Mansel's *Metaphysics* is divided into two parts—PSYCHOLOGY, or the science of the facts of consciousness, which expresses the science of mind generally; and ONTOLOGY, or the science of the same facts considered in their relation to realities existing without the mind—that is, the problem of Perception, or Metaphysics in the narrower sense.

**METASTASIO** (originally TRAPASSI), PIETRO, one of Italy's most admired poets, was born at Rome in 1698, of humble parents, and gave early evidence of his genius by his boyish improvisations. Having attracted the casual notice of Gravina, a famous juriconsult of the day, the latter undertook the entire education and career of the youth, whose paternal name of Trapassi became thenceforward Grecised into Metastasio, both words being identical in signification. The young poet speedily advanced in classical and general knowledge; and to his patron's enthusiastic devotion to the Greek drama, may doubtless be traced much of the after-taste of M.'s own poetical tastes. By the early death of Gravina, M. was placed in possession of considerable property. In 1724, he published one of his most celebrated dramas, *La Didone*, which, with *Il Catone* and *Il Siroe*, conferred on the poet a European name. In 1730, M. accepted the post of poet-laureate to the imperial court of Vienna. During his sojourn in Vienna, M. composed his *Giuseppe riconosciuto*, *Il Demofonte*, and the *Olimpiade*. He died at Vienna in 1782. M. was distinguished for the generosity, integrity, and candour of his nature, the sincerity of his friendships, and the disinterested warmth of his sentiments. His works are innumerable, embracing 63 dramas, 48 canzonas, besides a vast number of elegies, canzonette, sonnets, and translations. They enjoy unexampled popularity among all grades of his countrymen; in their pure classical subjects and forms, the educated student finds instruction and delight; while their facile musical grace and verbal simplicity adapt them to the popular appreciation of the artless beauties of poetry. The best editions of M. are those of Turin (1757, 14 vols.); Paris (1755, 12 vols.); Paris (1780, 12 vols., large 8vo); Genoa (1802, 6 thick vols.); Mantua (1816—1820, 20 vols.).

**METAYER** (Ital. *metà*, Fr. *moitié*, half), in French, is the cultivator of a *metairie*, or farm, the tenant of which gives the landlord a portion of the produce as his rent. In some of the older French dictionaries, such as that of Trevoux, the word is said to apply to any kind of farmer, but in the oldest dictionary of French and English, Cotgrave's, the word is thus interpreted: 'Properly one that takes ground, to the halves, or binds

himself by contract to answer unto him of whom he holds them half, or a great part of the profits thereof.' The term has lately got a meaning in political economy on account of some eminent writers having raised the question, whether this arrangement between landlord and tenant is not so much more advantageous than any other, both to the parties immediately concerned, and to the public at large, that it ought to be specially encouraged. Sismondi appears to have been the first to open this wide view of the influence of the practice, and he has given a chapter to its consideration in his *Political Economy* (b. iii. chap. 5). He says what cannot be denied, that such an arrangement was a great improvement on mere serfdom, which gave the cultivator no interest in the produce of his industry. But in giving the reasons for his admiration of the system as one which provides in the general case for the wants of the peasant while relieving him of all anxiety about markets and prices, he admits that a metayer peasantry never advance beyond the humble, happy, and contented lot which immediately falls to them. It is a system, therefore, inconsistent with the application of large capital to cultivation, and consequently with the extraction of the highest value which the soil can yield. A tenant will hesitate to lay £50 worth of guano on his fields if half the additional crop it will bring goes to his landlord. To those who maintain that the moral effect of the system is beneficial, this will be no argument against it, but to the political economist it is an argument against the practicability of the system in a rich money-making agricultural country. Where there is an enterprising peasantry without capital it is a valuable resource; a great portion of the valuable agricultural districts of Scotland were thus brought into cultivation by improvers whose rent was a portion of the crop. But while these very districts in a great measure owe their present prosperity, and the existence of a set of capitalist-farmers to such a system of cultivation pursued with more energy than M. Sismondi considers natural to it, there is no doubt that the substitution of such an arrangement for money-rent would now be a very serious waste.

**METELLUS**, the name of a Roman family of the plebeian gens Cæcilia, which rose to be one of the first families of the Roman nobility.—One of the most distinguished members of the family was QUINTUS CÆCILIUS M. MACEDONICUS, who received his surname from his victory over Andrisicus, an aspirant to the throne of Macedonia (148 B.C.). His life was considered by ancient writers an example of the greatest felicity. He died 115 B.C.—Another was QUINTUS CÆCILIUS M. NUMIDICUS, who twice defeated Jugurtha in Numidia (109 B.C.), and was celebrated for his integrity of character, but was superseded in his command by Marius. His son, QUINTUS CÆCILIUS M., surnamed *Pius*, joined Sulla in 83 B.C., but sought to moderate the severity of his proscriptions. He, too, bore a distinguished character for virtue.—QUINTUS CÆCILIUS M. CRETICUS conquered Crete, and reduced it to a Roman province (67 B.C.).—QUINTUS CÆCILIUS M. PIUS SCIPIO, sometimes called QUINTUS SCIPIO, and sometimes SCIPIO M., was a son of Publius Cornelius Scipio, who was adopted by one of the Metelli, and became the father-in-law of Pompey, and his zealous partisan. He commanded under him at Pharsalus, maintained war on his behalf for some time in Africa; and after the battle of Thapsus (46 B.C.), died by his own hand.

**METEMPSYCHOSIS**. See TRANSMIGRATION OF SOULS.

## METEOROLOGY.

**METEOROLOGY** (Gr. *metēōra*, meteors, or atmospheric phenomena) was originally applied to the consideration of all appearances in the sky, both astronomical and atmospheric; but the term is now confined to that department of natural philosophy which treats of the phenomena of the atmosphere as regards weather and climate. The leading points of this wide subject will be found under such heads as AEROLITES, ATMOSPHERE, BAROMETER, BOILING, CLOUDS, DEW, ELECTRICITY, EVAPORATION, FOG, HAILSTONES, HALOS, HOAR-FROST, LIGHTNING, MAGNETISM, RAIN, SNOW, STORMS, &c. We confine ourselves here to a historical sketch of the science.

Owing to the complexity of the phenomena, meteorology is the most difficult and involved of the sciences, and seems, indeed, at first sight, almost incapable of being reduced to a science at all. On this account, the only procedure admissible in the first place is long and patient observation, and a faithful recording of facts.

From the nature of the subjects which make up the science, it may be inferred that they occupied men's minds from a remote antiquity. The splendid and ever-varying panorama of the sky, and the changes of temperature through the days and the seasons, with all the other elements constituting the weather, and thus powerfully affecting the necessities and comfort of man, are of a nature well fitted to arrest his attention. From the time spent in the open air in the early ages, and from the imperfect protection afforded against the inclemency of the seasons, those appearances which experience proved to precede a change of weather would be eagerly recorded and handed down. In this way, many most valuable facts were ascertained and passed current from hand to hand; and, perhaps, there is no science of which more of the leading facts and inferences have been from so early a period incorporated into popular language.

Aristotle was the first who collected, in his work *On Meteors*, the current prognostics of the weather. Some of these were derived from the Egyptians, who had studied the science as a branch of astronomy, while a considerable number were the result of his own observation, and bear the mark of his singularly acute and reflective mind. The next writer who took up the subject was Theophrastus, one of Aristotle's pupils, who classified the opinions commonly received regarding the weather under four heads, viz., the prognostics of rain, of wind, of storm, and of fine weather. The subject was discussed purely in its popular and practical bearings, and no attempt was made to explain phenomena whose occurrence appeared so irregular and capricious. Cicero, Virgil, and a few other writers also wrote on the subject without making any substantial accessions to our knowledge; indeed, the treatise of Theophrastus contains nearly all that was known down to comparatively recent times. Partial explanations were attempted by Aristotle and Lucretius, but as they wanted the elements necessary for such an inquiry, being all but totally ignorant of every department of physical science, their explanations were necessarily vague, and often ridiculous and absurd.

In this dormant condition, meteorology remained for ages, and no progress was made till proper instruments were invented for making real observations with regard to the temperature, the pressure, the humidity, and the electricity of the air. The discovery of the weight or pressure of the atmosphere made by Torricelli in 1643, was undoubtedly the first step in the progress of meteorology to the rank of a science. This memorable discovery disclosed what was passing in the more elevated

regions of the atmosphere, and thus the elevations and depressions of the barometric column largely extended our knowledge of this subtle element. See **BAROMETER**.

The invention and gradual perfecting of the Thermometer (q. v.) in the same century, formed another capital step; as without it, nothing could be known, beyond vague impressions, regarding temperature, the most important of all the elements of climate. This great invention soon bore excellent fruit. Fahrenheit constructed small and portable thermometers, which, being carried by medical men and travellers over every part of the world, furnished observations of the most valuable description—the comparative temperature of different countries became known, and the exaggerated accounts of travellers with regard to extreme heat and cold were reduced to their proper meaning. Scarcely less important was the introduction of the Hygrometer (q. v.), first systematically used by De Saussure (died 1799), and afterwards improved by Daniell, Daniell, and August. From the period of the invention of these instruments, the number of meteorological observers greatly increased, and a large body of well-authenticated facts of the utmost value was collected. The climates of particular parts of the earth were determined, and the science made great and rapid advances by the investigations undertaken by distinguished philosophers into the laws which regulate the changes of the atmospheric phenomena.

The theory of the trade-winds was first propounded by George Hadley in the *Philosophical Transactions* for 1735; and it may be mentioned as a remarkable fact, that, for about half a century, it remained quite unnoticed, when it was independently arrived at by Dalton, and published in his essays.

The publication of Dalton's *Meteorological Essay*, in 1793, marks an epoch in meteorology. It is the first instance of the principles of philosophy being brought to bear on the explanation of the intricate phenomena of the atmosphere. The idea that vapour is an independent elastic fluid, and that all elastic fluids, whether alone or mixed, exist independently; the great principles of motion of the atmosphere; the theory of winds, their effect on the barometer, and their relation to temperature and rain; observations on the height of clouds, of thunder, and on meteors; and the relations of magnetism and the aurora borealis—are some of the important questions discussed in these remarkable essays, with an acuteness, a fulness, and a breadth of view that leave little to be desired.

One of the most interesting and fruitful subjects of inquiry that engaged the attention of meteorologists was dew. The observations on this subject were first collected and reduced to a perfect theory by Dr Wells. See **Dew**.

In 1823, Daniell published his *Meteorological Essays and Observations*, which, while adding largely to our knowledge in almost every department of the subject, are chiefly valuable as bearing on the hygrometry of the atmosphere. Though the practical advantages which he anticipated would flow from it have not been realised, yet this difficult and still obscure department of meteorology stands indebted to him more than to any other philosopher. The law of the diffusion of vapour through the air, its influence on the barometric pressure, and its relations to the other constituents of the atmosphere, are among the least satisfactorily determined questions in meteorology. Since this element is so important as an indicator of storms and other changes of the weather, and since so much remains still to be achieved, it is to be hoped that it will soon be more thoroughly investigated. A most

## METEOROLOGY.

important addition has lately been made to our knowledge of the vapour of the atmosphere by Professor Tyndall, in his experiments on radiant heat, especially as regards the gases. The vapour of water is there shewn to exert extraordinary energy as a radiant and absorbent of heat; and hence the vapour dissolved in the air acts the part of a covering or protection to the earth. As it is, to some extent, impervious to solar and terrestrial radiation, it follows that if the air were quite drained of its moisture, the extremes of heat and cold would be as intense and insufferable, that all life would instantly perish, there being no screen shielding the earth from the scorching glare of the sun by day, and from the equally scorching and blighting effects of its own radiation by night. It is to be expected that this great discovery will soon throw light on many questions of meteorology.

Electrical observations have been, of all meteorological observations, perhaps the least productive, partly owing to their scantiness, from the expense and trouble attending them, and partly, no doubt, to the free and bad use made of the name of electricity by crude theorists in explaining phenomena of which it would have been wiser to have confessed their ignorance. But the brilliant discoveries which have recently been made on the mutual relations of heat, motion, electricity, magnetism, and the other forces of matter, lead us to indulge the hope that the application of these results to meteorology will be attended with discoveries equally brilliant and important.

Humboldt's treatise on *Isothermal Lines* (1817) constitutes a notable epoch in experimental meteorology. Dörsch has since continued the investigation, and in his splendid work, *On the Distribution of Heat on the Surface of the Globe*, has given charts of the world, shewing the temperature for each month and for the year, and also charts of abnormal temperatures. It is scarcely possible to overestimate the value of this work, for though, to a considerable extent, the lines are hypothetical, there can be no doubt that a close approximation to the march of mean temperature and its distribution over the earth through the year, has been arrived at. The idea has been carried out with greater fulness of detail by the United States' government in the beautiful and elaborate series of charts of temperature and rainfall given in the *Army Meteorological Register* for 1855. In these charts, the temperature and rainfall in the different seasons for every part of the United States, deduced from accurate observations, may be seen at a glance. Buchan has published isothermals for the British Isles, Mohn for Norway, and Blandford for Hindustan; and isothermals in the sea have been published by the Admiralty.

The establishment of meteorological societies during the last twenty years must also be commemorated as contributing in a high degree to the solid advancement of the science which, more than any other, must depend on extensive and carefully conducted observation. In this respect, the United States stand pre-eminent, the observers there numbering nearly 800. Great Britain is also well represented in the English and Scottish societies, which together number above 200 observers. In France, Germany, Russia, &c., the science is also being rapidly cultivated. Owing to the disastrous flooding of the Rhone, an inquiry has been carried on for several years, having for its object the determination of those causes which affect the rainfall in the basins of the Rhone and Saône. Observers in Germany and Great Britain have been secured to co-operate with the French observers, and under the management of a commission, it may be expected that important conclusions respecting the

rainfall and the progress of storms will be arrived at, and means devised to avert the calamity of these great floods, by timely warning being given of their approach.

A special object of meteorological societies is to ascertain the degrees of heat, cold, and moisture in various localities, and the usual periods of their occurrence, together with their effects on the health of the people, and upon the different agricultural productions; and by searching into the laws by which the growth of such products is regulated, the agriculturist may be enabled to judge with some degree of certainty whether any given article can be profitably cultivated.

But perhaps none of the arts have benefited to so large an extent by the labours of meteorologists as navigation. The knowledge thus acquired of the prevailing winds over the different parts of the earth during the different seasons of the year—and the regions of storms and calms—and the laws of storms, have both saved innumerable lives, and by pointing out the most expeditious routes to be followed, shortened voyages to a remarkable degree. In connection with this, the name of Captain Maury (q. v.) deserves special commendation for the signal service he has rendered to navigation.

Another fruit of the multiplication of meteorological stations is the prediction of storms and 'forecasts' of the weather, which have been carried on in the United States, and commenced with ability and success by Admiral Fitzroy in England. These 'forecasts' are based on telegrams which are received every morning from above forty selected stations in Great Britain and Ireland, and on the continent, from Haparanda as far south as Lisbon. These telegrams give the exact state of the barometer, thermometer, hygrometer, and rain-gauge, with the direction and force of the wind, and appearance of the sky, at each of these forty stations at eight in the morning. In the event of there being any storm or other atmospheric disturbance at one or more of these places, a full and accurate description of it is thus conveyed to London; and it is thence the duty of the officials there to consider the direction in which the storm is moving, so as to enable them to give warning of its approach by special signals. But in addition to warnings of storms, Fitzroy also issued daily 'forecasts' of the weather likely to occur in the different districts of Great Britain for the following two days, and which were in like manner founded on the state of the atmosphere at distant points, keeping in view the atmospheric currents known generally to prevail at that particular time of the year. As the cost of this system was about £2000 annually, a severe test was applied, at the instance of the Treasury, from July 1861 to June 1862, for the purpose of ascertaining whether the expenditure was justified by the success attending it. During the first six months, 413 signals were hoisted, and in 214 cases a storm occurred where a warning was given. It must not be inferred that in the remaining 199 cases there was no storm anywhere; all that was meant was, that no storm occurred at the places where the signal was given; but a storm may have occurred, and probably did occur, in some other part of the country. Now that the system has been longer in use, the signals are given from a better knowledge of the movements of the atmosphere, so that if the test were again applied, the number of failures would be found to be much fewer. Since the barometric depression is in almost all cases spread over a wider area than the storm which accompanies it, and since the storm occasionally passes into the upper regions of the atmosphere, so as to be less felt on the earth's surface at that place,

## METHODISTS.

At this quarterly meeting, candidates for office of the ministry are proposed by the presiding minister, and the nomination is approved or rejected by the members. Still larger associations are the 'districts,' composed of from ten to twenty circuits, the ministers of which meet once a year, under the presidency of one of their number, for the following purposes: 1. To examine candidates for the ministry, and to try 'cases' of immorality, insubordination, or inefficiency on the part of the clergy. 2. To decide preliminary questions concerning the building of chapels. 3. To investigate and determine the claims of the poorer circuits to assistance from the general funds of the Society. 4. To elect a representative to the Committee of Conference, whose duty is to nominate ministers for the different stations for the ensuing year—their appointments, however, being subject to the revision of Conference. In all the financial and other purely secular business of the districts, the lay members (such as circuit-stewards and others) deliberate and vote equally with the clergy. The supreme Methodist assembly is the 'Conference,' the first was held in 1744, when John Wesley met with his brother Charles, two or three other clergymen, and a few of the 'preachers'—men whom his zeal and fervour had induced to abandon their secular employments, and devote themselves to declaring the message of the Gospel. The purpose for which he had gathered them together was, he says, 'for the sake of consulting on the affairs of the "societies" . . . . the result of our consultations we set down to the rule of our future practice.' In the course of his life, Wesley presided at forty-seven of these annual assemblies. The Conference now consists of ministers, mostly seniors, who hold their office according to arrangements prescribed in a Deed of Declaration, executed by John Wesley himself, and enrolled in Chancery. But the representatives previously mentioned, and all the ministers elected by the district committees to attend—may or may not be members of the legal Conference—sit and vote usually as one body, the 100 determining their decisions. In this assembly, which is exclusively clerical, every minister's character is subjected to renewed and strict scrutiny, and if charge be proved against him, he is dealt with accordingly; candidates for the ministry are examined both publicly and privately, and set apart to the sacred office; the entire proceedings of the district courts (if we may so call them) are finally reviewed; and the condition, requirements, and prospects of the body are duly considered.

**Doctrine and Worship.**—Under this head, not much requires to be said. Wesleyan Methodists are to be considered *orthodox, Protestant, and evangelical*. The propriety of the last two appellations is probably not to be disputed, but a rigid Calvinist might object to the first. They accept the *articles* of the English Church, but believing these articles have been framed on a basis of *comprehension*, they consider themselves at liberty to accept them in an Arminian sense. It must not, however, be supposed that they are out-and-out Arminians. Their great distinguishing doctrine is the universality and freedom of the atonement; hence they reject the Calvinistic doctrine of predestination which they conceive to be incompatible with the latter, but while they maintain the freedom of the will and the responsibility of man, they also maintain his total fall in Adam, and his utter inability to recover himself. If these two appear to the layman understanding to conflict, it is nevertheless asserted that the Bible teaches both; and it is objected to high Calvinism, that in its anxiety to be logical, it has shewn itself unscriptural. Pro-

minence is also given by the Wesleyan M. to certain points of religion, some of which are not altogether peculiar to them. They insist on the necessity of men who profess to be Christians feeling a *personal interest* in the blessings of salvation—i. e., the assurance of forgiveness of sins and adoption into the family of God. This, however, is not to be confounded with a certainty of *final salvation*. They believe the Spirit of God gives no assurance to any man of that, but only of *present pardon*. In harmony with this view, they reject the doctrine of the necessary perseverance of the saints, and hold that it is fearfully possible to fall from a state of grace, and even to perish at last after having 'tasted of the heavenly gift,' and having been 'made partakers of the Holy Ghost.' They also maintain the perfectibility of Christians, or rather the possibility of their entire sanctification as a privilege to be enjoyed in this life. But Wesley 'explains' that 'Christian perfection does not imply an exemption from ignorance or mistake, infirmities or temptations; but it implies the being so crucified with Christ as to be able to testify, "I live not, but Christ liveth in me." He regards the sins of a 'perfect' Christian as 'involuntary transgressions,' and does not think they should be called 'sins' at all, though he admits that they need the atoning blood of Christ. The Wesleyan Methodists in their religious services use more or less the English liturgy; the morning service being read in many of their chapels, and the sacramental offices being required in all. They observe a 'watch-night' on the eve of the New Year, on which occasion the religious services are protracted till midnight, and their chapels are generally crowded to excess; and in the beginning of the year they hold a 'covenant-service,' at which congregations stand up to a man (though this form is not invariable), and solemnly vow to serve the Lord. But even the ordinary religious services in some places are frequently marked by an ebullition of fervent feeling on the part of the audience, which has a very singular effect upon a stranger.

**3. History.**—The history of Methodism is for many years the history of Christian effort to evangelise the neglected 'masses' of England. The labours of Wesley, and of those whom he inspired to imitate his example, were of the noblest description, and met with remarkable success. The reformation of life which his preaching produced, for example, among the Kingswood colliers and the Cornwall wreckers, is a testimony to the power of religion which cannot be too highly estimated. The zeal which has inspired the body in regard to foreign missions, although in the highest degree honourable, is only the logical development of their efforts at home—for they originally regarded their society in England as simply a vast 'home mission,' and neither Wesley nor his followers desired to consider themselves a 'sect,' a new church, in the common usage of the term, but were warmly attached to the old national church, and considered themselves among her true children. When Wesley died (1791), his 'societies' had spread over the United Kingdom, the continent of Europe, the States of America, and the West Indies, and numbered 80,000 members. Since then, they have largely increased, and, according to the official returns published in 1873, the membership (including the numbers in foreign missions, embracing continental India, Northern Europe, China, Asia Minor, the South Sea and West India Islands) amounts to 586,753 (of whom 348,580 belong to Great Britain and 19,977 to Ireland), and the number of ministers, 2514. The annual income of 'The Wesleyan Methodist Missionary Society' in 1870 was £145,000.

## METHODISTS.

The Wesleyan M. have three theological colleges for the training of ministers, one at Richmond Hill, Surrey, a second at Didsbury, South Lancashire, and a third at Headingley, in Yorkshire, besides the establishments at Sheffield and Taunton; two schools (New Kingswood School and Woodhouse Grove School) for the education of sons of Wesleyan ministers; and two for the daughters, one at Clapton and another at Southport. The boys receive a six years' and the girls a four years' course of instruction. The Methodist Book-room is situated in the City Road, London, and issues hundreds of thousands of religious publications (tracts, &c.) monthly. The newspapers and other periodicals professedly in connection with the body are the larger and smaller *Magazines*, the *Christian Miscellany*, *Wesleyan Sunday School Magazine*, monthly *Exercises on Scripture Lessons*, *Early Days*, the *Watchman*, the *Methodist Recorder*, and the *London Quarterly Review*. Among the more eminent Methodist authors may be named the two Wesleys, Fletcher, Benson, Clarke, Moore, Watson, Drew, Edmondson, Sutcliffe, Jackson, Treffry, Rule, Nichols, Smith, and Etheridge.

METHODIST EPISCOPAL CHURCH, the name given to the Society of Wesleyan M. in the United States of America, where the first members of that body—immigrants from Ireland—established themselves as a religious society in New York in the year 1766. In the course of a year or two, their numbers had considerably increased, and they wrote to John Wesley to send them out some competent preachers. Two immediately offered themselves for the work, Richard Boardman and Joseph Pilmoor, who were followed in 1771 by Francis Asbury and Richard Wright. The agitations preceding the War of Independence, which soon afterwards broke out, interrupted the labours of the *English* Methodist preachers in America, all of whom, with the exception of Asbury, returned home before the close of the year 1777; but their place appears to have been supplied by others of native origin, and they continued to prosper, so that, at the termination of the revolutionary struggle, they numbered 43 preachers and 13,740 members. Up to this time, the American Wesleyan M. had laid no claim to being a distinct religious organisation. Like Wesley himself, they regarded themselves as members of the English Episcopal Church, or rather of that branch of it then existing in America, and their 'preachers' as a body of irregular auxiliaries to the ordained clergy. 'Episcopal churches,' we are informed, 'are still standing in New York and elsewhere, at whose altars Embury, Pilmoor, Boardman, Strawbridge, Asbury, and Rankin, the earliest Methodist preachers, received the holy communion.' But the recognition of the United States as an independent country, and the difference of feelings and interests that necessarily sprung up between the congregations at home and those in America, rendered the formation of an independent society inevitable. Wesley became conscious of this, and met the emergency in a manner as bold as it was unexpected. He himself was only a presbyter of the Church of England, but having persuaded himself that in the primitive church a presbyter and a bishop were one and the same order, differing only as to their official functions, he assumed the office of the latter, and, with the assistance of some other presbyters who had joined his movement, he set apart and ordained the Rev. Thomas Coke, D.C.L., of Oxford University, bishop of the infant church, September 2, 1784. Coke immediately sailed for America, and appeared, with his credentials, at the Conference held at Baltimore, December 25 of the same year. He was unanimously recognised by the assembly of preachers,

appointed Asbury coadjutor bishop, and ordained several preachers to the offices of deacon and elder. Wesley also granted the preachers permission (which shews the extensive ecclesiastical power he wielded) to organise a separate and independent church under the Episcopal form of government: hence arose the 'Methodist Episcopal Church in the United States of America.' Nevertheless, there were not a few who were dissatisfied with the Episcopal form of government. This feeling grew stronger and stronger, until, in 1830, a secession took place, and a new ecclesiastical organisation was formed, called the METHODIST PROTESTANT CHURCH, whose numbers, according to the *Methodist Almanac* for 1851, amounted to 72,000 members and 423 preachers. In 1842, a second secession took place, chiefly on the question of slavery—the seceders pronouncing all slave-holding sinful, and excluding slave-holders from church membership and Christian fellowship; and, in 1843, a meeting was held at Utica, New York, where a new society was constituted and named the WESLEYAN-METHODIST CONNECTION of AMERICA, whose members in 1870 amounted to 20,000, and its preachers to 250. But in 1844 a far larger and more important secession took place on the same question, when the whole of the Methodist societies in the then slave-holding states, considering themselves aggrieved by the proceedings instituted at the general conference of New York (1840) against the Rev. James O. Andrew, D.D., one of the bishops, and a citizen of Georgia, who had married a lady possessed of slaves, resolved to break off connection with their northern brethren. Hence originated the METHODIST EPISCOPAL CHURCH, SOUTH, whose numbers, in 1870, were as follow: Travelling preachers, 2833; local preachers, 4759; and members, 571,241, including whites, coloured, and Indians. To these must be added 375,000 members forming the African Methodist Episcopal Church, and 172,000 of the African Methodist Episcopal Zion Church. In 1869, a movement began in favour of the re-union of the northern and southern sections of the Methodist Episcopal Churches, which is likely—now that slavery is abolished—to be successfully carried out. It may here be stated, that the members of the *Northern Methodist Episcopal Church* amounted in 1870 to 1,298,938.

Returning to the English Wesleyan M., we now proceed to mention the various secessions from the parent body in the order of time.

1. THE METHODIST NEW CONNECTION.—This society detached itself from the older one in 1797, its doctrines and order are the same; the only difference being that it admits one layman to each minister into the Conference, and allows them to share in the transaction of all business, both secular and spiritual. These laymen are chosen either by the circuits, or by 'guardian representatives' elected for life by the conference. In 1870, the numbers of the New Connection were: members, 33,095; preachers, 176. The Canada Conference has 8000 members, and 90 travelling preachers.

2. PRIMITIVE METHODISTS, vulgarly designated RANTERS, were first formed into a society in 1810, though the founders had separated from the old society some years before. The immediate cause of this separation was a disagreement as to the propriety of camp-meetings for religious purposes; and also upon the question of females being permitted to preach. A third point of difference is the admission to their conference of two lay delegates for every minister. In 1869, their numbers were: members, 161,229; preachers, 1212.

3. INDEPENDENT METHODISTS, who separated in 1810. They are chiefly distinguished by their rejection of a paid ministry, and number in England

## METHUEN TREATY—METHYL.

and Scotland: members, 4000; preachers, 290; scholars, 6000.

4. BIBLE CHRISTIANS, also called BRYANTITES, were formed by a local preacher named Bryan, who seceded from the Wesleyans in 1815. The only distinction between them and the original body appears to be that the former receive the eucharistic elements in a sitting posture. In 1869, their numbers were: members, 26,275; preachers, 248.

5. UNITED FREE CHURCH METHODISTS have been recently formed by the amalgamation of two sects of nearly equal numerical strength. The older of these, called the WESLEYAN ASSOCIATION, originated in 1834 in the removal of one or two influential ministers from the original connection. Points of difference subsequently appeared with regard to the constitution of the conference.—The younger sect, called the WESLEYAN REFORM ASSOCIATION, took its rise in 1849 through the expulsion of several ministers from the parent body on a charge of insubordination, and being founded on the same principles as the last-mentioned community, arrangements were entered into for their union, which was subsequently effected. Church independency, and freedom of representation in the annual assembly, are two of the most prominent distinctive traits in the organization of the United Methodist Free Church. Their united numbers in 1873 were: members, 60,678; ministers, 286; local preachers, 3201; Sunday scholars, 155,358; Sunday-school teachers, 23,708.

This is perhaps also the most convenient place to notice the WELSH CALVINISTIC METHODISTS. They are not a secession from the followers of Wesley, but originated partly in the preaching of his friend and fellow-evangelist, Whitefield, and partly in that of Howel Harris, a Welsh clergyman of the Church of England. Whitefield was a Calvinist; Wesley, as we have seen, was on some points decidedly Arminian. A difference arose between them on the subject of election. Henceforward their paths lay in different directions. Whitefield, however, did not form a religious sect; and after his death (1769), his followers, being left without any distinct bond or organisation, either followed the leading of the Countess of Huntingdon (q. v.), or became distributed among other denominations, a large portion, especially in Wales, becoming absorbed in the new society gradually forming itself through the preaching of Howel Harris and his coadjutors. This body, however, was not formally constituted a religious society till the beginning of this century. In 1859, its numbers were: members, 58,577; preachers, 207.

METHUEN TREATY, a commercial treaty between England and Portugal in 1703, so-called in consequence of being negotiated by Paul Methuen of Corsham, English ambassador at Lisbon. It was agreed, by the treaty, that the wines of Portugal should be received by England at a rate of one-third less duty than those of France. In 1836, the Portuguese government relinquished the stipulations of the treaty.

METHYL is an organic radical homologous with Ethyl (q. v.), being the lowest term in the series  $C_nH_{2n+1}$ , in this case being equal to 2. Its formula is  $C_2H_5$ ; but in its free state, two atoms unite to form a single molecule, so that free methyl is more accurately represented by  $(C_2H_5)_2$ . It is a colourless gas, of specific gravity 1.036; it burns with a very feeble bluish flame, and is not liquefied at a temperature of 0°. It is obtained by acting upon iodide of methyl with zinc, in the same manner as in the preparation of ethyl.

Like ethyl, it forms a very numerous class of compounds, of which the following are the most

important: *Hydride of Methyl* ( $C_2H_5H$ ), known as *Light Carburetted Hydrogen* (q. v.), *Marsh-gas*, and *Fire-damp*, may be obtained either naturally or artificially. As a natural product, it sometimes issues from fissures in coal-seams, rushing forth as if under high pressure. These discharges of this gas are termed 'Blowers' by the miners, and it is by the combustion of this fire-damp that the terrific explosions which occasionally take place in coal-pits are caused. For its combustion, twice its volume of oxygen (and consequently ten times its volume of air) is required; the resulting compounds being one volume of carbonic acid and two of steam. The vitiated air thus produced, which is utterly unfit for respiration, is known as the *after-damp* or *choke-damp*, and is as much dreaded as the explosion itself. Hydride of methyl is also one of the gaseous exhalations from marshes and stagnant pools; and the bubbles that rise to the surface when the mud at the bottom of a pond is stirred up, consist chiefly of this gas. It may be prepared artificially by strongly heating a mixture of crystallised acetate of soda, hydrate of potash, and powdered quicklime. It is a colourless, inodorous, tasteless gas, which may be breathed without apparent injury if well diluted with air. *Hydrated Oxide of Methyl* ( $C_2H_5O,HO$ ), known also as *Methylic Alcohol*, *Wood Spirit*, and *Pyroxylic Spirit* (under which title its properties are described), is the strict homologue of vinous or ethylic alcohol ( $C_4H_9O,HO$ ). *Oxide of Methyl* ( $C_2H_5O$ ), or *Methylic Ether*, corresponds to the ordinary, or, correctly speaking, the ethylic ether, and, like the latter, is produced by the distillation of a mixture of methylic alcohol and sulphuric acid. Oxide of methyl, like oxide of ethyl, combines with acids to form a class of ethereal salts, or compound ethers, as they are termed by some chemists—as, for example: Acetate of Methyl (or methyl-acetic ether),  $C_2H_5O,OC_2H_3O_2$ ; Butyrate of Methyl (or methyl-butyric ether),  $C_2H_5O,OC_4H_7O_2$ ; Nitrate of Methyl (or methyl-nitric ether),  $C_2H_5O,NO_2$ ; Salicylate of Methyl (or methyl-salicylic ether),  $C_2H_5O,C_7H_5O_2$ . The last-named compound may not only be obtained by distilling a mixture of pyroxylic spirit with salicylic and sulphuric acids, but occurs ready formed in the vegetable kingdom, constituting the essential oil procured from the *Betula lenta*, a species of birch, and from the *Gaultheria procumbens*, or *Winter Green*.

Methyl may be made to enter into combination with bromine, iodine, chlorine, and fluorine, the bromide and iodide of methyl being colourless fluids, and the chloride and fluoride colourless gases. Amongst the most interesting of the numerous methyl compounds must be mentioned the artificial bases or alkalies, which can be obtained from ammonia by the substitution of one, two, or three equivalents of methyl for one, two, or three of the equivalents of hydrogen contained in the ammonia.

If only one equivalent of hydrogen is replaced by methyl, the resulting compound is  $NH_2(C_2H_5)$  or  $C_2H_5N$ , an extremely alkaline gas known as *methylamine*, or *methyllia*, which is more soluble in water than any other known gas; water at 55° dissolving 1150 times its bulk. It is a frequent product of the destructive distillation of nitrogenous substances; and it is present when many natural alkaloids, such as narcotine and morphia, are distilled with caustic potash. The product resulting from the substitution of two equivalents of methyl for two of hydrogen, and known as *dimethylamine*, closely resembles methylamine. When the three equivalents of hydrogen are replaced by three of methyl, the resulting compound is  $N(C_2H_5)_3$  or  $C_6H_{15}N$ , a colourless gas, which is known as *trimethylamine*, or *trimethyllia*, and has a disagreeable

# METHYLATED SPIRIT—METRE.

fishy odour. It occurs in large quantity in herring-brine, and has been detected in the spirit in which anatomical preparations have been long kept. It has also been found in *Chenopodium vulvaria* (or Stinking Goose-foot), in the flowers of *Cratægus oxyacantha* (or Common Hawthorn), and in ergot of rye.

**METHYLATED SPIRIT** consists of a mixture of alcohol, of specific gravity 0·830, with 10 per cent. of Pyroxylic (q. v.) or wood-spirit. This addition of wood-spirit renders it unfit for drinking, although it scarcely interferes with its power as a solvent. It is allowed by the excise to be sold duty-free for manufacturing purposes, and for preserving specimens in museums.

**METONIC CYCLE**, so called from its inventor, Meton, who flourished at Athens about 432 B.C., is a cycle of 19 years, at the end of which time the new moons fall on the same days of the year, and eclipses recur in nearly the same order. This arises from the circumstance, that 19 solar years are nearly equal to 235 lunations, their average values being 6939·68835 and 6939·60249 days respectively.

**METONYMY** (Gr. *metonymia*, signifying a change of name) is a figure of speech by which one thing is put for another to which it bears an important relation, as a part for the whole, the effect for the cause, the abstract for the concrete, &c. For example, 'Lying lips are an abomination to the Lord.' This figure is very expressive, and is much used in proverbial and other pithy modes of speech.

**METOPÉ**, the space, in the frieze of the Doric order, between the triglyphs—generally ornamented with figures, or bulls' heads, or pateræ.

**METRA**, an ingenious pocket-instrument, invented by Mr Herbert Mackworth, about 1858. It combines the thermometer, clinometer, goniometer, anemometer, level, plummet, scales, &c., so that, by its assistance, travellers or engineers can at once record their observations. It enables us to determine the dip of rocks, angles of crystals, temperature, rate of wind, to take levels of large surfaces, determine latitude, and a variety of other matters connected with physical science. As a pocket-instrument, it is of great value.

**METRE** (Gr. *metre*) is that regulated succession of certain groups of syllables in which Poetry (q. v.) is usually written. A greater or less number of groups forms a *line* or *verse* (Lat. a turning), and in modern languages, the verses usually rhyme with one another; although this is not at all essential to the notion of metre. See RHYME, BLANK VERSE. In the classic languages, metre depended upon the way in which long and short syllables were made to succeed one another. English metre depends, not upon the distinction of long and short, but upon that of *accented* and *unaccented* syllables. Thus, in the lines,

The cu'r|few to|lls | the kne'll | of pa'rt|ing da'y—

Wa'rri|ors and | chi'efs, should the | sha'ft or the | swo'rd—  
the accents occur at regular intervals; and the groups of syllables thus formed constitute each a metre, or measure. The groups of long and short syllables composing the metres of classic verse, were called *feet*, each foot having a distinctive name. The same names are sometimes applied to English measures, an accented syllable in English being held to be equivalent to a long syllable in Latin or Greek, and an unaccented syllable to a short.

Every metre in English contains one accented syllable, and either one or two unaccented syllables. As the accent may be on the first, second, or third syllable of the group, there thus arise five distinct

measures, two dissyllabic and three trisyllabic seen in the words—1, fo'lly (corresponding to classic Trochee); 2, reca'll (Iambus); 3, tee (Dactyle); 4, confu'sion (Amphibrachys); 5, tee' (Anapaest).

These measures are arranged in *lines* or *verses*, varying in length in different pieces, and of the same piece. The ending measure of a line is frequently incomplete, or has a superfluous syllable; and sometimes one measure is substituted for another. All that is necessary is that some one measure be so predominant as to give character to the verse. Constant recurrence of the same measure produces monotony. The following lines exemplify the five measures:

## 1st Measure.

Ri'ch the | trea'sure.

Be'tter | si'xty | yea'rs of | Ea'rope | tha'n a | cy|  
Ca|tha'y.

## 2d Measure.

Al'o'ft | in a'w|ful sta'te.

The pro'p|er stu'd|ly of | mank'nd | is ma'a

## 3d Measure.

Bi'rd of the | wi'l'derness.

Wa'rri|ors and | chi'efs, should the | sha'ft or the |

## 4th Measure.

The de'w of | the mo'rning.

O you'ng Loch|inva'r has | come ou't of | the w

## 5th Measure.

As they ro'ar | on the sho're.

The Assy'ri|an came do'wn | like a wo'lf | on the

It is instinctively felt that some of these measures are better suited for particular subjects than others. Thus, the first has a brisk, abrupt, energetic character, agreeing well with lively and gay subjects, and also with the intense feeling of such pieces as *Scots wha hae*. The second is by far the most usual metre in English poetry; it occurs, in most frequently in the ordinary prose-movement of the language. It is smooth, graceful, and adapts readily to easy narrative, and to the expression of the gentler feelings, or to the treatment of severe and sublime subjects. The trisyllabic metres, owing to the number of unaccented syllables in them, are rapid in their movement, and calculated to express rushing, bounding, impetuous feelings. They are all less regular than the dissyllabic measures. One of them is frequently substituted for another, as in the opening of Byron's *Bride of Abydos*:

Kno'w ye the | la'nd where the | cy'press and | my'r|  
Are e'mblems | of dee'ds that | are do'ne in |  
cli'me;  
Where the ra'ge | of the vu'l'ture, the lo've | of  
tu'r'tle—

where each of the three lines is in a different measure. In addition to this irregularity, one of the unaccented syllables is often wanting. For instance, in Hemans's poem, *The Voice of Spring*:

I co'me, | I co'me! | ye have ca'll'd | me lo'ng;  
I co'me | o'er the mou'n'tains with li'ght | and so

the first line has only one measure of three syllables, although the general character of the verse is trisyllabic.

In a kind of verse introduced by Coleridge, and used occasionally by Byron and others, the unaccented

syllables are altogether left out of account, and the classification is made to depend upon having a regular number of accents in the line:

There is not wind enough to tell  
The wind and bird, the bird and the child,  
That there is a difference in the  
On the highest wing that looks up at the sky.

Here there are four accents in each line, but the number of syllables varies from eight to eleven.

To scan a line or group of lines, is to divide it into the measures of which it is composed.

The variety of combinations of metres and rhymes that may be formed, is endless; but a few of the more usual forms of English versification have received special names, and these we may briefly notice.

**Sextuplars** are verses made up each of four measures of the second kind of metre, and therefore containing eight (two) syllables:

With fire in the heart, Oh! in the hand  
And steel in the hand, the guiding wheel.

Such poems are mostly in **sextuplars**, and so is *Madrigal*, and many other pieces.

**Heroic** is a term applied to verses containing five accents of the second kind, or ten syllables. Heroics either rhyme in couplets, or are without rhymes, constituting blank verse. Many of the chief narrative and didactic poems in the English language are in rhyming heroics; as those of Chaucer, Dryden, Pope, Cowper, &c. Milton's two great poems, *Young's Night Thoughts*, Thomson's *Seasons*, Cowper's *Task*, Wordsworth's *Excursion*, and many others, are written in blank heroics. Metrical dramas are almost always in blank verse; in which case there is frequently a superfluous syllable, or even two, at the end of the line:

To be, or not to be, that is the question;  
Whether 'tis nobler in the mind to suffer.

In *Elegiacs*, the lines are of the same length and the same measure as in heroics; but the rhymes alternate, and divide the poem into quatrains or stanzas of four lines, as in Gray's *Elegy*. The *Spenserian stanza*, popularised by Spenser in the *Fairy Queen*, and much used by Byron, differs from common heroics only in the arrangement of the rhymes, and in concluding with an Alexandrine (6, c.).

**Service metre**, also called **common metre**, is the form of versification adopted in the metrical Psalms, in many hymns, and other lyrical pieces. From being frequently employed in ballads, this metre is also called *ballad metre*. The first and third lines often rhyme, as well as the second and fourth.

Such are some of the more usual and definite forms of versification. In many poems, especially the more recent ones, so much licence is assumed, that it is difficult to trace any regular recurrence or other law determining the changes of metre, or the lengths of the lines; the poet seeks to suit the modulation at every turn to the varying sentiments. But it may be questioned whether much of this refinement of art is not thrown away, upon ordinary readers at least, who, failing to perceive any special suitableness, are inclined to look upon those violent departures from accustomed regularity as the results of caprice.

The kind of verse called *Hexameter* is described under its own name.

**MÈTRE**, the basis of the 'metrical' or modern French system of weights and measures, and the unit of length. The first suggestion of a change in the previous system dates as far back as the time of

Philippe le Bel; but up till 1790, no important change had been effected. On the 24th May 1790, proposals were made by the French government to the British, for the meeting of an equal number of members from the Academy of Sciences and the Royal Society of London, to determine the length of the simple pendulum vibrating seconds in lat. 45° at the level of the sea, with the view of making this the unit of a new system of measures. The British government, however, did not give this proposal a favourable reception, and it fell to the ground. The French government, impatient to effect a reform, obtained the appointment by the Academy of Sciences of a commission composed of Berthollet, Laplace, Monge, and Condorcet, to choose from the following three, the length of the pendulum, of the fourth part of the equator, and of the fourth part of the meridian, the one best fitted for their purpose. The commission decided in favour of the last—resolving that the *metre*, which of a quadrant of the meridian (the distance from the equator to the pole, measured as along the surface of still water) be taken for the basis of the new system, and be called a 'metre.' Delambre and Méchain were immediately charged with the measurement of the meridian between Dunkerque and Barcelona; and the result of their labours was referred to a committee of twenty members, nine of whom were French, the rest having been deputed by the governments of Holland, Savoy, Denmark, Spain, Tuscany, and the Roman, Cisalpine, Ligurian, and Helvetic republics. By this committee, the length of the metre was found to be 443.296 Parisian lines, or 39.370794 English inches; and standards of it and of the kilogramme (see **GRAMME**) were constructed, and deposited among the archives of France, where they still remain. The 'metrical system' received legal sanction 21 November 1801. The following are the multiples and fractions of the metre which are in common use, expressed in English measure:

	English Inches.		
Millimetre,	0.03937094		
Centimetre,	0.3937094		
Decimetre,	3.937094		
Metre,	39.37094	=	3.2808399 ft = 1.093633 yds.
Decametre,	393.7094	=	32.808399 ft = 10.93633 yds.
Hectometre,	3937.094	=	328.08399 ft = 109.3633 yds.
Kilometre,	39370.94	=	3280.8399 ft = 1093.633 yds.
Myriametre,	393709.4	=	32808.399 ft = 10936.33 yds.

From the metre, the other principal units of measure and weight are at once derived. See **ARE**, **LITRE**, **GRAMME**, **FRANC**.

**METRONOME**, a valuable small machine for indicating the correct time or speed at which a musical composition should be played. It was invented in 1815 by Mälzel, the inventor also of the automaton trumpeter. See **AUTOMATON**. The test of a correct metronome is, that when set at 60 it shall beat seconds.

**METROPOLIS LOCAL MANAGEMENT ACT**. The metropolis of the United Kingdom, owing to its immense size, has been regulated for edile and sanitary purposes chiefly by special acts, one of which is called the **Metropolis Local Management Act**. It had long been subject to a special Building Act, which laid down minute regulations as to the formation of streets, alteration and building of houses; and the **Metropolis Buildings Act** still contains a code applicable to building regulations, the chief principle of which is, that no person can build or make alterations till they have been duly approved by the inspectors, whose duty it is to see that certain conditions have been complied with as regards the public safety. In 1855, a great change was made in the internal economy of the metropolis, by the **Metropolis Local Management Act**, which

# MEXICO.

level and varieties of soil. They generally incline northward, and are for the most part girt in by low mountain chains, among which rise individual lofty peaks, as Coffre de Perote (13,400 feet), Orizava (17,370 feet), and others; while they are intersected by higher ranges, above which tower a few cones, as Istaccihuatl, the White Woman (15,700 feet), and the volcano of Popocatepetl, or the Smoking Mountain (17,880 feet). These volcanoes and several others of less note, lying within the parallels of 18° 15' and 19° 30' N. lat., form a transverse volcanic band between the two oceans, and do not follow the inclination of the central chain, as is the case in the volcanoes of South America. Volcanoes also occur isolated, as, for instance, in the plain of Mixtecapan, 2900 feet above the sea, where, in 1759, the volcano of Jorullo, which still emits smoke, was formed after an eruption by which a surface of many square miles was raised several feet above the level of the plain; in fact, every part of the Mexican territory betrays the volcanic nature of its formation, although neither earthquakes nor any other active phenomena have of late been of frequent occurrence. The principal chain, intersecting the table-land, is the Sierra Madre, or Tepe Suene, in which lie the chief gold and silver mines, and which, after traversing the states of Queretaro and Guanajuato, divides into three main branches, the central of which forms the water-shed between the Pacific Ocean and the Gulf of Mexico. In addition to these great chains, the Mexican territory is intersected by numerous lesser ranges, which on the Pacific side break up the terraced declivities into innumerable deeply-cleft valleys, which assume almost the character of steep ravines near their junction with the narrow littoral plains of the Pacific Ocean. Violent storms rage on this coast, blowing from the south-west during the hot months, when the climate is as prejudicial to whites as on the Mexican Gulf, although it is not visited by the yellow fever. M. may be said to be generally deficient in navigable rivers; for although some of the largest have a course of more than 1000 miles, few are free from rapids. The Rio Santiago, or Rio Grande, with a course of 500 miles, is broken near Guadaluajara by 60 falls in the space of less than three miles; the Rio Grande del Norte, which forms in its lower courses the boundary between M. and the United States, has a winding course of nearly 1800 miles, but it is only navigable for small sailing-vessels to Matamoros, 60 miles from its mouth, where a bar and numerous shoals prevent the passage of large vessels. A similar remark applies to the majority of the rivers which fall into the Gulf of Mexico. The eastern coast generally presents great obstacles to navigation, as it is low and sandy, unbroken by bays or inlets, and lined by sandbanks several miles in width; the only points of access being the mouths of rivers, which are not good roadsteads, as, with few exceptions, the rivers have little water, except at the rainy season, which generally sets in about June, accompanied by overpowering heat, during the prevalence of which the yellow fever, or *vomito prieto*, rages like a pest in all the low lands. M. is on the whole badly supplied with water; and since the Spaniards have discontinued the system of irrigation, which was followed by the Aztec races with so much success, many tracts have become barren, and unsuited for the purposes of human occupation. A great portion of the table-lands can only be used for pasture. Springs are rare, and many of the rivers flow in deep mountain-beds, without receiving smaller tributaries, while the rapid evaporation on a light soil, covering porous rocks, leaves the surface dry and hot, and unable to support any

vegetation beyond the cactus and some low grasses. The plains, moreover, contain the beds of numerous dry salt lakes, but this is chiefly the case in the north and east of the table-land. The western parts of the plateaux between 100° and 102° W. long. (known as the Baxio) yield, by careful irrigation, rich crops of maize and wheat, and rank among the most fertile agricultural districts of Mexico. They are, however, here and there interrupted by sterile tracts, either covered by stones, and then known as 'pedregal,' or with lava, when they are characterised as a *mal pais* (bad country). In contrast with these unprofitable districts, the plains are occasionally broken by depressions of the soil, known as *Barrancas*, descending sometimes 1000 feet, and measuring several miles across, which are covered with a luxuriant vegetation of trees and shrubs, and watered by small streams running through the middle of the valley. M. has numerous lakes, but few of any importance; that of Chapala in Jalisco is one of the most considerable, being more than 30 miles long.

*Climate, Products.*—The differences of climate, depending upon the different degrees of altitude, are so great in M., that the vegetable products of the vast country include almost all that are to be found between the equator and the polar circle. In the course of a few hours, the traveller may experience every gradation of climate, embracing torrid heat and glacial cold, and pass through different zones of vegetation, including wheat and the sugar-cane, the ash and the palm, apples, olives, and guavas. The Spaniards, on their first occupation of M., distinguished its great climatic divisions under the characteristic names, which are still retained, of the *Tierras Calientes* (hot or littoral lands), *Tierras Templadas* (temperate lands), and *Tierras Frias* (cold or high lands). The mean annual heat of the *Tierras Calientes* is 77°; and the soil, which is generally fertile, produces maize, rice where water can be procured for irrigation, bananas, pine-apples, oranges, mamey, and sarsaparilla, jalap, and vanilla in the lateral swampy forests. This tract has only two seasons—the winter, or season of north winds, and the summer, or season of breezes. In the former, the hurricanes are the terror of navigators, but the coast is clear of yellow fever, which prevails in the hot season. On the medium elevations of the *Tierras Templadas*, the temperature is extremely equable, varying only from about 70° to 80° F.; the climate healthy, and wherever water is abundant, a perpetual summer reigns, yielding a varied and active vegetation, which embraces all the cereals, fruits, and vegetables of Central and Southern Europe, amongst which maize, oranges, lemons, grapes, and olives are produced in the most exuberant abundance. The *Tierras Frias*, which would scarcely have been characterised as cold by discoverers belonging to a less southern climate than Spain, possess a generally temperate climate, the mean annual heat ranging between 66° and 68° F.; but on the highest of the table-lands, the air is keener, and the soil more arid, and agriculture is limited to the cultivation of barley and of the agave, or Mexican aloe, which held the place of the vine among the ancient Aztecs, and is still extensively cultivated for the sake of its juice, which is made into the fermented drink known under the name of *pulque*. In addition to the vegetable products already referred to, M. yields coffee, tobacco—whose growth is, however, limited by governmental restrictions—yams, capsicums, pepper, pimiento, indigo, ipecacuanha, dragon's-blood, copaiba, fan-palm, india-rubber trees, mahogany, rosewood, ebony, &c.

The products of the mines, which rank among the richest in the world, include the precious metals

## MEXICO.

ness of M. occur principally on the west Sierra Madre, north of 24° N. lat., and the discovery of the metal in Australia, their need the produce of any other part of M. Silver mines abound in M., and the veins, which may be said to intersect the western declivities of the Andes, in places, as in the *Vela Madre* lode at in beds varying from 10 to 50 yards the precious metal being in these cases with sulphur compounds, antimony, and although these mines possess the additional advantage of being situated in fertile and abundant food to miners; but their working has been very imperfectly owing to the unsettled state of the country at the close of the last, and the beginning of the present century, the annual value of the gold of M. was upwards of £6,000,000, of which the silver was yielded by the silver; but the disturbances, preceding and consequent on the independence, have very considerably diminished the sum, which has probably never been since M. was finally separated from the empire. In addition to gold and silver, M. produces antimony, mercury, copper, lead, iron, and carbonate of soda, used in smelting and crystallised on the surface of several lakes, together with common salt, in the more arid parts of the surface of table-lands.

Sheep, asses, mules, and sheep abound in consequence of the extent and excellent pasture-grounds, all the domestic animals introduced from the Old World have multiplied. Buffaloes feed in the lower plains; sheep are plentiful; the tapir, wolf, fox, jaguar, wild-cat, several species of the brown porcupine, stag, deer, &c., are common. Parrots, humming-birds, and wild including turkeys, are abundant; and the lakes yield large quantities of fish. The insect and the silk-worm are reared in great success on the table-land of Mixtecapan.

*Commerce.*—Notwithstanding the enormous resources presented by her natural productions, her important geographical position which she occupies between the Atlantic and the Pacific, M., under an unsettled government, and the insecurity of life and property, has shewn a backward movement in regard to commerce since the date of her independence; and the annual trade is now estimated at only about six millions sterling, the imports amounting to one-fifth and the exports to three-fifths of that sum. The metals constitute, it is estimated, one-third of the exports, the remainder being the productions of the soil, and industrial manufactures such as cotton, woollen, and silk goods, saddlery, gold and silver lace, cigars, &c. England, France, Hamburg, and Lübeck, the United States of America, are the principal countries which M. maintains relations of foreign commerce. While the city of Mexico is the chief port of the empire, and Vera Cruz the principal maritime commerce. For the number of ships arriving and clearing the ports of M., see the article on TAMPAICO. The financial condition of the country has been allowed to fall into such disorder since the establishment of independence, that the debt has been continually increasing beyond all calculation; but as no details of the department of finance have been published since 1856, and no accurate knowledge before that period were not available, it is impossible to give thoroughly accurate estimates. According to the printed estimates,

the estimated amount of the budget for 1870 was £2,884,113. The total expenditure for the previous year was £2,609,348. But according to the authorities cited by M. Chevalier in his work, *Le Mexique, Ancien et Moderne* (Paris, 1863), the receipts amounted to as much as £3,400,000, while the expenditure amounted to £3,718,750, half the receipts being absorbed by the budget for the war expenses. The national debt is reported to have amounted in 1858 to 145 million piastres.

*Army, Navy, &c.*—In accordance with the old constitution of M., the standing army was to consist of 26,000 men, with a reserve of 65,000 men; but this number, which had fallen to nearly half the required force in 1855, has been so extensively reduced since that period by continual civil wars, that, according to Spanish authorities, the government of the late President Juarez, on the breaking out of hostilities with the French in 1862, was unable to bring into the field more than 5000 infantry, 800 cavalry, and 9500 of the national guard. The navy consisted of only some 300 men, while the fleet numbered only 9 small ships-of-war, carrying in all between 30 and 40 cannon. Education in M. is in the lowest possible condition, even among the wealthier classes, although the various military dictators who have wielded supreme power have all in turn drawn up elaborate schemes for the general instruction of the people. There is a university in the city of Mexico, but its management, like that of every other public institution, is in a disorganised state, and in the hands of the clergy.

*Religion, &c.*—The Roman Catholic is the dominant church of M., to the almost entire practical exclusion of any other. M. has 1 archbishop and 11 bishops. The administration of justice is inefficient, the courts venal, and all the subordinate officers of the law corrupt. Brigandage and smuggling endanger personal security, and seriously damage the resources of the nation.

The supreme power of the state was, in 1858, vested in the hands of Benito Juarez, who was to bear the title of Constitutional President, and administer public affairs in conjunction with a legislative congress, composed of a chamber of senators and a lower house of representatives. Each province was to elect two senators and one deputy to every 40,000 inhabitants, and was, moreover, to have a separate provincial legislative chamber, presided over by its governor. President Juarez is undoubtedly, along with General Iturbide, to be regarded as the most distinguished character in modern Mexico. The unfortunate Maximilian was a mere episode in the career of the country. A Provisional Regency of the Mexican Empire was appointed by the *Junta Superior del Gobierno*; which was itself constituted (16th June 1863) by a decree of Marshal Forey, leader of the French army of invasion. It was composed of 35 members. This Junta at the same time established, under French influence, an *Assembly of Notables*, whom it charged with deciding in the name of the people what form of government M. should adopt. On the 10th of July 1863, this body, by an overwhelming majority, decided in favour of a constitutional hereditary monarchy, and that the new ruler should bear the title of Emperor of Mexico. The person selected for this new dignity was the particularly unfortunate Archduke Maximilian of Austria, brother of the emperor of Austria, and son-in-law of King Leopold of Belgium.

*History of Mexico.*—The history of ancient M. exhibits two distinct and widely-differing periods, the former of which, that of the Toltecs, appears to have begun in the 7th, and ended with the 12th c.; while the second, that of the Aztecs, began

# MEXICO.

in the year 1200, and may be said to have been closed by the conquest of Cortes in 1519; for although the race has maintained occupation of the Mexican territory, its existence as a nation ceased with the Spanish domination. The origin and primitive seats of the Toltecs are shrouded in mystery; and all that we learn of this people is, that they came from the north, from some undefined locality, which they designated Tullan, and from whence they brought to the valley of Mexico the first elements of civilisation. Their laws and usages stamp them as a people of mild and peaceful instincts, industrious, active, and enterprising. They cultivated the land, introduced maize and cotton, made roads, erected monuments of colossal dimensions, and built temples and cities, whose ruins in various parts of New Spain still attest their skill in architecture, and sufficiently explain why the name Toltec should have passed into a synonym for architect. They knew how to fuse metals, cut and polish the hardest stones, fabricate earthenware, and weave various fabrics: they employed hieroglyphics for the record of events, were acquainted with the causes of eclipses, constructed sun-dials, devised a simple system of notation, and measured time by a solar year, composed of 18 months of 20 days each, adding 5 complementary days to make up the 365, and intercalating 12½ days at the expiration of every 52 years, which brought them within an almost inappreciable fraction to the length of the tropical year, as established by the most accurate observations. These and other arts, with a mild form of religion, and a simple but just mode of administering the laws, the Toltecs bequeathed to the Aztecs, who engrafted upon the civilisation of their predecessors many fierce and sanguinary practices in their religious, and many puerile usages in their social life. Nothing is known of the exact time, and still less of the manner and causes of the departure of the Toltecs from M.; but it has been conjectured that they went towards the south, and that the colossal architectural remains of the cities of Palenque, Uxmal, and Mitla, in Central America, are the work of their hands. The Aztecs, as we have said, imparted to the institutions of the Toltecs a tinge of their own sombre cruelty, and produced an anomalous form of civilisation, which astonished the Spaniards by its mingled character of mildness and ferocity. Like the Toltecs and the Chichimecs, a rude tribe who had succeeded them, the Aztecs came from the north, and after wandering from place to place, founded in 1325 the city of Tenochtitlan, or Mexico. On the arrival of the Spaniards, their empire was found to extend from ocean to ocean, stretching on the Atlantic from 18° to 21° N. lat., and on the Pacific from 14° to 19° N. lat. Their government was an elective empire, the sovereign being selected from the brothers of the deceased prince, or, in default of them, from his nephews. Their laws were severe, but justice was administered in open courts, the proceedings of which were perpetuated by means of picture-written records.

The Aztecs believed in one supreme invisible creator of all things, the ruler of the universe, named Taotl—a belief, it is conjectured, not native to them, but derived from their predecessors, the Toltecs. Under this supreme being stood 13 chief and 200 inferior divinities, each of whom had his sacred day and festival. At their head was the patron god of the Aztecs, the frightful Huitzilopochtli, the Mexican Mars. His temples were the most splendid and imposing; in every city of the empire his altars were drenched with the blood of human sacrifice. Cortes and his companions (see DIAZ) were permitted by Montezuma to

enter that in the city of Mexico, and to behold the god himself. 'He had a broad face, wide mouth, and terrible eyes. He was covered with gold, pearls, and precious stones; and was girt about with golden serpents. . . . On his neck, a fitting ornament were the faces of men wrought in silver, and their hearts in gold. Close by were braziers with incense, and on the braziers three real hearts of men who had that day been sacrificed' (Higgin's *Spanish Conquest in America*, vol. II., book 2, chap. 4). The smell of the place, we are told, was like that of a slaughter-house. To supply victims for these sacrifices, the emperors made war on all the neighbouring and subsidiary states, or in case of revolt in any city of their dominions, and levied a certain number of men, women, and children by way of indemnity. The victims were borne in triumphal processions and to the sound of music to the summit of the great temples, where the priests, in sight of assembled crowds, bound them to the sacrificial stone, and opening the breast, drew from it the bleeding heart, which was either laid before the image of their gods, or eaten by the worshippers, after having been carefully cut up and mixed with maize. In the years immediately preceding the Spanish conquest, not less than 20,000 victims were annually immolated. These atrocities were inconspicuously blended with milder forms of worship, in which fruits, flowers, and perfumes were offered up amid joyous outbursts of song and dance. According to their mythology, Taotl, who delighted in these purer sacrifices, had once reigned at Anahuac (a name which at first probably applied only to the country in the immediate vicinity of the capital, though afterwards it was applied to the whole Aztec empire) in the golden age of the world, but being obliged, from some unexplained cause, to retire from earth, he departed by way of the Mexican Gulf, promising to return. This tradition accelerated the success of the Spaniards, whose light skins and long dark hair and beards were regarded as evidences of their affinity with the long-looked-for divinity. The Mexican priesthood formed a rich and powerful order of the state, and were so numerous that Cortes found as many as 5000 attached to the great temple of Mexico. The education of the young of both sexes remained till the age of puberty in the hands of the priests and priestesses; and the sacerdotal class were thus able to exercise a widely-diffused influence, which, under the later rulers, was almost equal to that of the emperor himself. The women shared in all the occupations of the men, and were taught, like them, the arts of reading, writing, ciphering, singing in chorus, dancing, &c., and even initiated in the secrets of astronomy and astrology.

On the arrival of Cortes, in 1519, the Aztec throne was occupied by Montezuma, an energetic prince, who, after his election to the throne, which for several generations had been occupied by his ancestors, made successful war on the powerful and highly-civilised neighbouring state of Tlascala, and on Nicaragua and Honduras; after a time, however, he grew indolent, and alienated the affection of his subjects by his arrogance and exactions, and by his unremitting devotion to the services of the temples. According to the oracles which he frequently consulted, great changes were impending over the empire, the return of Quetzalcoatl was near at hand, and the fall of his race was impending. The tidings of the arrival on the coast of the expedition of Grigalva in 1518 terrified Montezuma and his priestly councillors; and when the hieroglyphic reports of his provincial officers announced the landing in the following year of Cortes and his companions, he endeavoured to propitiate the dreaded strangers by sending an embassy charged with

## MEXICO.

uable gifts to meet them. The road to success was thus open to the Spanish captain, who, with a handful of men, advanced from St Juan de Ulloa to the interior, and gradually subdued the entire empire of the Aztecs, whose power crumbled to dust before the superior energy and superior civilisation of their Christian invaders. In 1540, M. was united with other American territories under the name of New Spain, and governed by viceroys appointed by the other country. The intolerant spirit of the Catholic clergy led to the suppression of almost every trace of the ancient Aztec nationality and civilisation, while the strict system of sequestration enforced on M. crippled the resources of the colony; yet notwithstanding these drawbacks, M. ranked first among all the Spanish colonies in regard to population, material riches, and natural products. It may be said to have vegetated for nearly three centuries in a state of semi-quietude, interrupted by a few disturbances of any kind until the year 1810, when the discontent, which had been gaining ground against the vice-regal power during the war of the other country with Napoleon, broke into open rebellion under the leadership of a country priest named Hidalgo. The defeat and subsequent execution of the latter in 1811 put a partial stop to the rebellion; but the atrocities committed under the sanction of the new viceroy, Calleja, exasperated the people, and gave an irresistible impulse to the revolutionary cause. Guerrero and Iturbide in turn gained signal advantages over the Spaniards. For a time, Iturbide maintained a self-established imperial rule over the colony; but on the downfall consequent on his tyrannical abuse of power, a constitutional form of government was inaugurated, and in 1824 the independence of M., which had chosen a liberal republican form of government, was finally established, and in the following year definitely recognised by every foreign power, except Spain. The Mexican war was stained with excesses and atrocities on both sides; but it must be confessed that the Spaniards gained an unenviable pre-eminence in regard to the wanton cruelty which characterised their method of conducting hostilities. With them the war was one of extermination, every offender being allowed, at his own discretion, to be hunted down and slaughtered the insurgents like beasts. The welfare of the new republic was happily disturbed by constant outbreaks of civil war under the leadership of the Escoscos, or aristocratic faction, and the Yorkinos, or democrats; and the history of the quarter of a century during which M. has exercised independent power, leaves little to recount beyond ever-recurring acts of violence, and the rapid and summary deposition of one president after another. In 1836, Texas secured her independence of the Mexican republic, for which it had struggled for several years, and at the same period differences arose with France, which were, however, brought to a peaceful conclusion by the taking of Vera Cruz in 1838 by the French army. In 1841, General Santa Anna, on the retirement of Bustamante, succeeded in regaining the direction of affairs, from which he had been more than once deposed, and under the title of Dictator, exercised the power of an autocratic ruler. In 1845, he was compelled to recognise the independence of Texas, which was incorporated with the United States, whose troops having entered the Mexican territory, provoked a declaration of war on the part of the Mexican government. Hostilities were carried on with great energy by both parties until 1848, when peace was finally concluded, after several bloody engagements had been fought without any definite result on either side; and the city of Mexico had been stormed and taken by the Ameri-

cans under General Scott. In 1852, after Santa Anna and Herrera had been in turn deposed and recalled to power, a revolutionary movement of more than ordinary importance brought General Cevallos for a time to the head of affairs; but, when the insubordination and arrogance of the soldiery threatened universal anarchy, Santa Anna was again recalled, 17th March 1853. Having reorganised the army, and suppressed by the most cruel severity the insurrection of the federals, he declared himself President for life, and thus again rekindled civil war. In 1855, he had to flee from the country. Since then, utter confusion has prevailed. Santa Anna was succeeded by General Alvarez, who held office for about two months, after whom came General Comonfort, who was forced to resign in 1858; when a General Zuluaga assumed supreme power, but was almost immediately deposed by a General Robles. This person also proving a futility, Benito Juarez was elected; but his claims were contested by General Miramon—the head of the priestly and Conservative party—and the country was plunged in civil war. The acts of wanton aggression and flagrant injustice perpetrated on foreigners in M. during this period of internal disorder, during which the Cortes passed an act suspending all payments to foreigners for two years, could not fail to draw upon the Mexican government the serious remonstrance of those European powers whose subjects had just cause of complaint; and the result was to bring a fleet of English, French, and Spanish ships into the Mexican Gulf for the purpose of enforcing satisfaction. In December 1861, the British minister left M., and the Spaniards disembarked a force at Vera Cruz, and took possession of the fort of St Juan d'Ulloa, a step which was soon followed by the arrival before the former city of the allied fleet. A proclamation, signed by the commanders-in-chief of the three naval divisions, and addressed by them to the Mexican people, elicited no satisfactory reply; and steps were accordingly taken to advance at once upon the capital. This measure alarmed the provisional government of M., and brought about an armistice, with a view of negotiating a treaty for the future regulation of commercial intercourse between M. and the great European powers. This treaty was drawn up and provisionally ratified by the different commanders, but not confirmed on the part of France, and consequently the French troops retained occupation of the Mexican territory after the English and Spaniards had declined to join in further hostile demonstrations. In April 1862, the French emperor formally declared war against the government of Juarez, who had assumed arbitrary rule as president of the republic. The French, who spent £8,000,000 on the Mexican expedition, did not meet with the sympathy and welcome from the people at large which the assumed unpopularity of Juarez had led them to anticipate; and, although the taking of Puebla and other decided successes gave them a firmer footing in the country, it was evident that whatever grievances the Mexican nation had against their government, they entertained a deeply-rooted hatred against foreigners, and were certainly not prepared to welcome with cordial unanimity the thorough reorganisation of their political system, which the European powers, with France at their head, were initiating for the country.—Comp. *Le Mexique, Ancien et Moderne*, par Michel Chevalier (Hachette, 1863). See MEXICO in SUPP.

**MEXICO (Crry).** Mexico, or Mejico, the capital of the republic, is situated in 19° 20' N. lat., and 99° 5' W. long., at an elevation of nearly 7500 feet above the level of the sea, in the valley of

Tenochtitlan, 2½ miles west of Lake Tezcuco. The pop. was, in 1868, 200,000. This beautiful city, which is built on the site of the ancient Tenochtitlan of the Aztec empire, is situated on an extensive plateau, having an area of more than 1700 square miles, surrounded by lofty mountains, and including five lakes within its area. The principal streets, which all converge towards the great square of Mexico, are regularly and well laid-out, broad, clean, and well-paved and lighted; but the buildings, both private and public, are low, and of a light style of architecture, in consequence of water being found in many parts of the city at only a few feet below the surface, and partly from apprehension of earthquakes. The Plaza Mayor, one of the finest squares of the western world, contains the cathedral, a spacious and imposing building, erected on the ruins of the great *teocalli*, or temple of the Aztec god Mixitli, and adorned with the *kellenda*, a circular stone, covered with hieroglyphics, by which the Aztecs used to represent the months of the year. The palace of the Cortes, in the same square, consists of various buildings appropriated to offices of state, government schools, and public institutions of various kinds, but like everything else in Mexico, has been suffered gradually to fall to decay since the evacuation of the Spaniards. Mexico contains fourteen churches, nearly fifty monasteries and convents, and numerous charitable institutions; the fine hospital has been converted into a barrack; and the university and academy of fine arts, both of which contain valuable collections of Aztec antiquities, are gradually being diverted from their original purpose. There is a theatre, and a circus for bull-fights; and in addition to the ordinary *alameda* or public walk of a Spanish city, Mexico is remarkable for the extent and beauty of its *paseos*, or raised paved roads, planted with double rows of trees, which diverge far into the country from every quarter of the city. Mexico still boasts a few of the water-gardens for which the ancient city was so celebrated, and although no longer floating, as in the days of the Aztecs, they form attractive objects in the midst of the surrounding swamps, which, by the negligence of the Mexicans, have been suffered to increase in the vicinity of the lakes. The trade of Mexico is chiefly a transit-trade, although it has a few manufactures, as cigars of superior quality, gold-lace, hats, carriages, saddlery, &c.; and these articles, together with gold and silver, and some of the numerous valuable natural products of the Mexican plain, it transports, chiefly by means of mules, to Vera Cruz and other ports, importing in return the manufactured goods of Europe and various colonial products.

MEXICO, GULF OF, a basin of the Atlantic Ocean, the estimated extent of which is 800,000 English square miles, is closed in by the United States on the north, by Mexico on the west and south, and its outlet on the east is narrowed by the jutting peninsulas of Yucatan and Florida, which approach within 500 miles of each other. Right in the middle of this entrance is planted the island of Cuba, dividing the strait into two—the Strait of Florida, 120 miles wide, between Cuba and Florida, and the Strait of Yucatan, 105 miles wide, between Cuba and Yucatan. The former or northern entrance connects the gulf with the Atlantic Ocean; the latter or southern, with the Caribbean Sea. The depth of water is supposed nowhere to exceed three-fourths of a mile, yet the gulf contains few islands—the Florida Keys, the deltas of the Mississippi, and a few on the coast of Yucatan, being the most important of them. The shores, which are very sinuous, form numerous bays, the largest of which is the Bay of Campeachy

(q.v.). The coasts are mostly low and sandy or marshy, and are lined with numerous lagoons; good harbours are consequently not numerous, the best being those of Vera Cruz, New Orleans, Pensacola, and Havana. The gulf is visited by violent northern gales called *nortes*, which prevail from September to March, when they attain their maximum force, and then immediately terminate. The most remarkable feature in connection with the Gulf of M. is the *Gulf Stream* (q.v.), which enters it by the southern channel, passes round it, and emerges through the Strait of Florida. Owing partly to the presence of this heated current, the temperature of the gulf is 8° or 9° higher than that of the Atlantic in the same latitude.

MEYERBEER, JAKOB, commonly called GIACOMO MEYERBEER, a celebrated musical composer of the present day, was the son of a wealthy Jewish banker, and was born at Berlin, September 5, 1794. He was a precocious child, playing tunes on the piano spontaneously (it is said) as early as his fifth year. He began to study dramatic composition under Bernhard Anselm Weber; and in 1810 entered the school of Vogler at Darmstadt, where he formed an intimate friendship with the renowned Karl Maria von Weber. While at Darmstadt, he wrote a cantata, *Gott und die Natur*. Subsequently, he composed an opera, *Jephthah*, produced at Munich in 1812; but though warmly admired by his friends, Vogler, Weber, and others, it fell flat on the audience, and was considered a failure. He now proceeded to Vienna, where he acquired a brilliant reputation as a pianist; but another opera which he produced here by command of the court, *Die beiden Kraljics*, was no more successful than the previous one. Italian music was the rage at the time, and nobody had a chance who did not imitate Rossini. M. was induced by his friend Salieri to visit Italy, where he became an enthusiastic convert to the new Italian school, and began the composition of a series of operas which proved highly popular. We may mention his *Romilda e Constanza* (performed at Padua in 1819), *Semiramide* (Turin, 1819), *Emma di Resburgo* (Venice, 1820), the first of M.'s compositions that excited a furor; *Margherita d'Angiò* (1822), *Esule di Grenada* (1823), and *Crociato* (Venice, 1825). The last of these afforded, perhaps, the most decisive proofs of the high genius of its author, and was received with great applause in Paris, whither M. now proceeded, and took up his residence. In 1831, was produced, after numerous rehearsals, his *Robert le Diable*, which caused an excitement 'perhaps unparalleled in the history of the Parisian stage;' while it was received with nearly as great enthusiasm in England, Italy, Austria, and Russia; and in 1836, *Les Huguenots*, in which he reached the climax of his fame. His next opera, *Le Prophète*, did not appear till 1840, but it fairly sustained the author's reputation. Since then, M.'s principal productions have been *Pierre le Grand* (1854) and *Donorah* (1858). Died 1864.

MEZE'N, or MEZENE, a district town in the government of Archangel, European Russia, 50 miles from the mouth of the river of the same name, remarkable for the salmon and herring fisheries which supply St Petersburg with frozen fish during winter. Pop. (1867) 1746.

MEZEN, or MEZENE, a river in the north of European Russia, rises in the north of the government of Vologda, and flows north-west into the White Sea, having a course of about 450 miles.

MEZÖ-TUR, a town of Hungary, on the Berettyó, an affluent of the Körös, 60 miles south-west of Debreczen. Pottery is made, and there is an important market. Pop. (1867) 20,447.

**MEZZOFANTI, GIUSEPPE, CARDINAL**, a remarkable linguist, was born, 17th September 1774, at Bologna, where he received his education, and subsequently (1815) received the office of university librarian. In 1831, he settled in Rome, and was advanced to the dignity of a Monsignore; in 1833, he was appointed secretary of the College of the Propaganda; then keeper of the Vatican Library; and in 1838, he was raised to the dignity of cardinal. He died, 15th March 1849, at Rome. M.'s European reputation was founded, not on any literary or learned works that he wrote, but on the almost miraculous extent of his linguistic acquisitions. Towards the end of his life, he understood and spoke fifty-eight different tongues. As early, indeed, as 1820, Lord Byron called him 'a walking polyglott, a monster of languages, and a Briareus of parts of speech.' He was not in the strict sense a critical or scientific scholar; yet, although his linguistic skill lay chiefly in verbal knowledge, his acquirements in other departments were by no means inconsiderable. See Russell's *Life of Cardinal Mezzofanti* (Lond. 1858).

**MEZZOTINTO.** See ENGRAVING.

**MIAGAO**, a town in the island of Panay, one of the Philippine Isles, in the province of Iloilo. The inhabitants, who are industrious, comfortable, and well educated, are estimated at 31,000 in number.

**MIAKO**, or **KIOTO**, now called **SAR-KIYO**, the ancient capital of Japan, situated in the S.-W. of the island of Nipon. Broad and clean streets cross each other at right angles, and the houses are mostly of the better class. During the double rule in Japan, it was the residence of the Mikado, then only the spiritual emperor, and was and is the stronghold of the national religion. Some of the temples are of great size and splendour. In 1868, the great revolution broke out; the Shogun, or temporal ruler, was deposed; and the Mikado, who was now invested with complete authority, both temporal and spiritual, removed his court to Yedo. Most of the aristocratic dwellings are consequently tenantless, and the population in 1872 was under 300,000. M., however, is still a great place for Japanese literature and art, and the *Consular Report* for 1871 speaks of the establishment of 64 public schools for boys and girls, besides special provision for instruction in English, French, and German. It is also celebrated for the manufacture and dyeing of silks.

**MIA MI**, a river of Ohio, United States of America, rises by several branches in the western centre of the state, and after a south-south-west course of 150 miles through one of the richest regions of America, and the important towns of Dayton and Hamilton, empties itself into the Ohio River, 20 miles west of Cincinnati. It is sometimes called the Great M., to distinguish it from the Little M., a smaller river, which runs parallel to it, 15 to 25 miles east, through the Miami Valley.

**MIA'SMA** (Gr. pollution; in the plural, *Miasmata*), or **MALARIA**. It is proved by the experience of all ages that there is an intimate connection between marshy districts and certain diseases, especially the various forms of intermittent and remittent fever; but the exact nature of the noxious agent, and the circumstances on which its formation and extrication depend, are even at the present day not altogether established. It is clearly neither heat nor moisture, for the crews of clean ships, when cruising in the tropics at a distance from land, are usually very healthy; nor is it any known gas extricated from the marsh, for the gases collected by stirring up marshes (carbonic acid, nitrogen, oxygen, and carburetted

hydrogen) may be inspired without giving rise to any symptoms resembling those produced by malaria. It may be regarded as an established fact, that the noxious agent is a product of vegetable decomposition occurring under certain conditions of heat and moisture. That vegetable decomposition is the source of the poison, is inferred from various circumstances. For example, this special morbid influence is nowhere so powerful as in the deltas and along the banks of large tropical rivers which, in their flood, bring down the washings of the soil, full of vegetable remains, which, upon the subsidence of the waters, are left reeking in the hot sun. Again, the poison has been traced, in various places in Italy, France, and the Netherlands, to the practice of steeping flax in stagnant waters, and even in streams; and in India, it was formerly the custom, after extracting the colouring matter, to throw the remains of the indigo into large heaps, which, in the course of three years, became excellent manure: it was found, however, that these heaps, alternately soaked by the heavy rains and heated by a tropical sun, decomposed and emitted miasmata precisely similar in their effects to those produced by marshes. Marsh-miasmata are seldom evolved at a temperature under 60°, but at and above 80° they are prevalent and severe; and the nearer we approach the equator, the more violent, as a general rule, do they become. Although moisture is necessary to the evolution of miasmata, an excess of it often acts as a preventive, and by impeding the access of atmospheric air, retards or prevents decomposition. This explains the apparent anomaly of an uncommonly rainy season producing opposite effects in different localities, sometimes not far distant from one another. Thus, in the West Indies, a very rainy season induces general sickness in the dry and well-cleared island of Barbadoes; while at Trinidad, whose central portions are 'a sea of swamp,' and where it rains nine months in the year, the excessive rain is a preservative from sickness; for in the seasons when rain falls only eight months or less, the swamps become dry and exposed to the sun, and severe remittent fevers are sure to follow.

Chemistry has hitherto failed in detecting any special ingredient to which the air evolved by marshes owes its poisonous qualities. The air collected in the most poisonous districts gives, on analysis, the same gases existing in the same proportions as normal air, nor (if we except the observations of Boussingault, which have not been confirmed by other chemists) does it give evidence of the presence of any organic body.

The infecting distance of this poison is a subject of great practical importance; and both the altitudinal range and the horizontal spread have to be noticed. In Italy, it is estimated that an altitude of about 1500 feet assures an exemption from marsh-poison; while in the West Indies, an elevation of at least 2000 feet is necessary. From observations made by Sir Gilbert Blane during the ill-fated Walcheren expedition, it appears that, in Europe, the horizontal spread of marsh-miasmata over fresh water is less than 3000 feet; but over salt water—at all events, in the tropics—the horizontal range is greater. The extent to which the poison may spread horizontally over land, is a much more complicated question, and depends, to a great extent, upon the nature of the soil. The effect of trees in intercepting miasmata is very remarkable, and is probably due partly to their condensing the vapours of the marsh, and partly to their altering the direction of the current of air. Pope Benedict XIV. caused a wood to be cut down which separated Villatri from the Pontine Marshes, and in consequence, for many

years, there was a most severe and fatal fever in a district previously healthy; and the same results have in many other cases followed the removal of trees.

In districts where this poison exists, it is found by experience that those who go out of their houses only during the day, after the morning fogs have dispersed, and before the evening mists appear, often escape the bad effects; and a full meal, with a few grains of quinine, should be taken before exposure to the morning air by travellers in a malarious district.

Dr Wood of Philadelphia has pointed out the extraordinary and very important fact, that miasmata are neutralised, decomposed, or in some other way rendered innocuous by the air of large cities. Though malarious diseases may rage around a city, and even invade the outskirts, yet they are unable to penetrate into the interior, and individuals who never leave the thickly-built parts almost always escape. What it is in the air of the city which is thus incompatible with malaria, is unknown; but very probably it is connected with the results of combustion, for the fire and smoke of camps are asserted to have had the same effects.

**MIAUTSÉ**, the aborigines or hill-tribes of China. From the dawn of Chinese history, we find the people of the plains contending against those of the high lands, and to the present day the hardy mountaineers have maintained their independence. They consist of numerous tribes, occupying large portions of Kwang-se, Kwei-chow, Yun-nan, Sze-chuen, and adjacent provinces. Some of them own Chinese sway; other tribes are absolutely independent. They are smaller in size and stature, and have shorter necks, and their features are somewhat more angular than the Chinese. Their dialects are various, and wholly different from the Chinese. Dr Macgowan describes them as skilful in the manufacture of swords. He has shewn that the M. of Western China and the Karens or hill-tribes of Burmah are identical.—Reports of Dr Macgowan's Lectures.

**MI'CA** (from the same root with Lat. *mico*, to glitter), a mineral consisting essentially of a silicate of alumina, with which are combined small proportions of silicates of potash, soda, lithia, oxide of iron, oxide of manganese, &c., according to which and the somewhat varying external characters, numerous species have been constituted by mineralogists. **COMMON M.**, also called **POTASH M.**, contains a notable but variable proportion of silicate of potash; it contains also a little fluorine. It is a widely diffused and plentiful mineral, entering largely into the composition of granite, mica-slate, and some other rocks, veins and fissures of which it also often fills up. It has a strong, and often almost metallic lustre. It is remarkable for the readiness with which it splits into thin elastic plates, which are generally transparent. The thinness and elasticity of these plates readily distinguish them from those of talc, and of the laminated variety of gypsum; they are also devoid of the greasy feel of talc. They are sometimes not more than one 300,000th part of an inch in thickness, are generally quite transparent, and are therefore much used in setting objects for the microscope. Plates of M. of large size are also used in Siberia, Peru, and Mexico as a substitute for glass in windows. Large plates, often a yard in diameter, are found in these countries, and in Norway and Sweden. M. is advantageously substituted for glass in lanterns, as it bears sudden changes of temperature better than glass, and in ships-of-war, as it is not liable to be broken on the discharge of cannon. Another use of M. is for

making an artificial aventurine; it is also employed in a powdered state to give a brilliant appearance to walls, and as a sand to sprinkle on writing. In the state of a very fine powder, it is known as *Café Gold* or *Café Silver*, according to its colour. It is usually colourless, but sometimes white, gray, green, red, brown, black, and rarely yellow, owing to the presence of iron, manganese, chrome, fluorine, &c., in its composition. It is sometimes found in beautiful crystals, which are generally rhombic or six-sided tables.—**LITHIA M.**, or **LEPIDOLITE**, contains lithia in small proportion. It is often of a new colour, or a peach-blossom colour. It is used for ornamental purposes. It is found in several places in Britain.—**MAGNETA M.**, or **BIOTITE**, contains about as much magnesia as alumina. It is often dark green.

**MICA-SCHIST** is, next to gneiss, one of the most abundant of the Metamorphic Rocks (q. v.). It consists of alternate layers of mica and quartz, but is sometimes composed almost entirely of the thin and shining plates or scales of mica, and from this it passes by insensible gradations into clay-slate. The quartz occurs pure in thin layers like mica-quartz. Garnets are in some districts abundant in this rock, making up a large proportion of the whole mass. Mica-schist is believed to be a highly altered shale or clay deposit, and the component minerals, including the garnets, to have been developed under the influence of metamorphic action from materials already existing in the unaltered strata. In many places, the mica-schist has a finely corrugated or wavy structure.

**MICAH**, the sixth (third in the lxx.) of the twelve minor prophets (Micayahu: Who is like unto Jah?). probably a native of Moresheth, prophesied during the reigns of Jotham, Ahaz, and Hezekiah, and was therefore contemporary with Isaiah, and Hosea, and Amos.—The Book of M. is regarded as divisible into three parts, each commencing with 'Hear ye,' organically connected, however, with each other, and shewing even a progressive development of idea in the mind of the writer. The destruction of Samaria (Israel), the danger and subsequent captivity of Judah; the wickedness of the rulers, the punishments that overtake the land, the glorious restoration of the theocracy; Jehovah's 'controversy with his people' on account of their sins, his warnings, his exhortations, and his sublime promise of forgiveness, form the principal points of M.'s prophecies, which relate to the invasions by Shalmaneser, Sennacherib, the Babylonian exile, the return, and the re-establishment of the theocracy under Zerubbabel. The style of M. is clear, vivid, concise, yet richly poetical; some passages, especially in the beginning and the last two chapters, are among the noblest in the Old Testament. The play upon words noticeable in Isaiah is also a marked feature of this writer.

**MICHAEL ANGELO (BUONAROTTI)**, who, in an age when Christian art had reached its zenith, stood almost unrivalled as a painter, sculptor, and architect, was born in 1474 at Chiusi, in Italy. He was of noble origin, having descended on his mother's side from the ancient family of Canossa, in Tuscany, while the Buonarrotti had long been associated with places of trust in the Florentine republic. M. A. learned the rudiments of painting from Bertoldo, a pupil of Domenico Ghirlandaio; and having been admitted as a student into the seminary which was established by Lorenzo the Magnificent for the study of ancient art in connection with the collections of statuary in the Medicean Gardens, he attracted the notice of Lorenzo by the artistic skill with which he had restored the mutilated head of a

# MICHAEL VI.—MICHELET.

ing faun, and was received into the palace of Medici, where he spent several years. Lorenzo's in 1492, and the temporary reverses which the Medici family in consequence of the incapacity of his successor, Piero, led M. A. to retire to Florence, whence he soon removed to Rome, whither he had preceded him. His earliest original work was a Kneeling Angel, executed for the grave of Dominic, at Bologna; the statues of Bacchus and David at Florence; and a magnificent group representing the *Mater Dolorosa*, which was placed in St Peter's, at Rome. Next in order of time, and owing to some of his contemporaries, first in rank M. A.'s great cartoon for the ducal chapel at Florence, which, together with the pendant by Leonardo da Vinci, has long since perished. This work, which represented a scene in the life of the Virgin, when a number of young Florentines, while bathing in the Arno, are surprised by the attack of the Pisans, shewed so marvellous a knowledge of the anatomical development of the human figure, and such extraordinary facility in the execution, that it became a study for artists of every land, and by its excellence created a new era in art. Pope Julius II. called M. A. to Rome, and commissioned him to make his monument, which was to be erected within St Peter's. Though this work was never completed on the original scale on which it had been designed, and was ultimately erected in the church of St Andrea Vincula, it is a magnificent composition, memorable for having given occasion to the construction of St Peter's on its present sublime plan in order the better to adapt it to the colossal dimensions of the proposed monument. The pope ordered upon M. A. painting with his own hand the ceiling of the Sistine Chapel, and, although unwilling, he began in 1508, and completed within less than two years his colossal task, which proved one of the most marvellous of his works. The subjects of these cartoons are taken from the book of Genesis, while between these and the representations of the persons of the Saviour's genealogy are figures of prophets and sibyls. M. A.'s art was too often trammelled by the unworthy influence in which Leo X. and successive popes engaged the former having employed him for years in preparing roads for the transportation of marble from Carrara, and in other ignoble labours. The Florentines and Bolognese vied with the pontiffs in order to secure his services; and to his skill as an architect Florence was indebted for the plans of the fortifications by which she was enabled for a prolonged time to resist the attempts of the Medici to recover possession of the city after their expulsion from it. On the surrender of Florence, he returned to Rome, where his great picture of the Last Judgment was painted for the altar of the Sistine Chapel. This colossal fresco, nearly 70 feet in height, which he completed in 1541, was regarded by contemporary critics as having surpassed all his other works for the unparalleled powers of invention and consummate knowledge of the human figure which it displayed. After its completion, M. A. devoted himself to the perfecting of St Peter's, and, by the touch of his genius, was converted from a mere Saracenic hall into the most superb temple of a Christian church. He refused all remuneration for this labour, which he regarded as a duty due to the glory of God. M. A. died in 1563, at Rome, but his remains were removed to Florence, and laid within the church of Santa Croce. His piety, benevolence, and liberality made him generally loved; and in the history of art, no name shines with a more unalloyed lustre than that of Michael Angelo.—See Vasari's *Vite de' Pittori* (Rome, 1553,

1823), and the English translations of that work.

**MICHAEL VI.**, surnamed **PALÆOLOGUS**, emperor of Constantinople. See **PALÆOLOGUS**.

**MICHAELIS**, **JOHANN DAVID**, one of the most eminent and learned biblical scholars of the 18th c., was born on 27th February 1717, at Halle, where his father, Christian Benedict Michaelis, a theologian and orientalist of some distinction, was a professor. After completing his studies at his native university, he travelled in England and Holland, where he made the acquaintance of several celebrated scholars. In 1745, he became a professor of philosophy at Göttingen, and took an active part in the formation of a scientific association there. From 1753 to 1770, he was one of the editors of the *Göttinger gelehrten Anzeigen*, and for some years he filled the office of librarian to the university. During the Seven Years' War, he was occupied in making preparations for an expedition of discovery in Arabia, which was afterwards made by Niebuhr. In the latter years of his life, he was almost always in the professorial chair or at his desk. He died on 22d August 1791. M. was a man of vast attainments in history and archaeology, and his labours were of great importance in the departments of Biblical Exegesis and History. He may be regarded as among the earliest of the critical school of German theologians, but he lived at too early a period to acquire anything like a consistent or systematic theory of the genesis of the Hebrew Scriptures. He loved to rationalise in details, and was never quite certain what to think about inspiration; at all events, he seeks constantly to prove how thoroughly human the Mosaic legislation was, though he does not exactly deny its claims to being considered a Divine revelation. Many of his pupils became professors, and disseminated his principles through the German universities.

M.'s chief works are his *Einleitung in die göttlichen Schriften des Neuen Bundes* (2 vols. Göttingen, 1750; English by Bishop Marsh); his *Mosaische Recht* (6 vols. Frankfurt, 1770–1775; English by Dr Alexander Smith, 1814); and his *Moral* (3 vols. Göttingen, 1792–1823). See his *Lebensbeschreibung von ihm selbst abgefasst* (Rinteln und Leipz. 1793).

**MICHAELMAS DAISY.** See **ASTER**.

**MICHAELMAS DAY**, one of the English quarter-days for payment of rent by tenants—viz., 29th September. Michaelmas term is one of the four legal terms during which the English courts of law and equity sit daily for despatch of business. It begins on the 2d, and ends on the 25th November. Michaelmas Head Court is the name given in Scotland to the annual meeting of heritors or freeholders of each county to revise the roll of freeholders, the duties being now discharged by the Commissioners of Supply.

**MICHELET**, **JULES**, a brilliant French historian, born at Paris 21st August 1798. He studied with great success under Villemain and Leclerc, and at the age of 23 became a professor in the Collège Rollin, where he taught history, philosophy, and the classics. In 1826, he published *Les Tableaux Synchroniques de l'Histoire Moderne*, and was named Master of Conferences (*Maître des Conférences*) at the *Ecole Normale*. After the revolution of 1830, he was chosen head of the historic section, intrusted with the care of the archives of the kingdom, assistant to Guizot at the Sorbonne, and tutor to the Princess Clémentine, daughter of the French king, and published several valuable books, such as *Précis de l'Histoire Moderne* (1833, of which there have been more than 20 editions), *Précis de l'Histoire de France jusqu'à la Révolution Française*

## MICHIGAN—MICROMETER.

(the 7th edition of which appeared in 1842), *Mémoires de Luther* (1835), *Origines du Droit Français* (1835), *cherchées dans les Symboles et Formules du Droit Universel* (1837). In 1838, he succeeded Dauman in the Collège de France, and Comte Reinhard in the professorship of Moral Philosophy. He now plunged into controversy with all the vivacity and impetuosity of his nature. The Jesuits were the grand objects of his dislike; and eloquence, sarcasm, sentiment, and history were all brought to bear upon them with brilliant effect. Three books were the fruits of his polemic: *Des Jésuits*, in conjunction with Edgar Quinet (1843); *Du Prêtre, de la Femme, et de la Famille* (1844); *Du Peuple* (1846). In 1847 appeared the first volume of his *Histoire de la Révolution*; and it was finished in 1853, in 6 vols. When the affair of 1848 broke out, acting more wisely than most of his learned confrères, he declined to take an active part in political struggles, and quietly pursued his literary avocations. He, however, lost his situation in the Archives Office after the *coup d'état*, by refusing to take the oath of allegiance to Louis Napoleon. Other works of his were *L'Oiseau* (1856), *L'Insecte* (1857), *L'Amour* (1858), and *La Femme* (1859); *La Mer* (1861), *La Sorcière* (1862), *La Bible de l'Humanité* (1864); and *Nos Fils* (1869), a plea for compulsory education. M. died in February 1874. His master-piece, however, is his *Histoire de France*, begun in 1833, of which the 12th volume appeared in 1860.

**MICHIGAN**, one of the United States of America, lying in lat. 41° 40'—48° 20' N., and long. 82° 25'—90° 34' W. It is bounded on the N. by Lake Superior and St Mary's River; E. by Lake Huron, River and Lake St Clair, Detroit River and Lake Erie; S. by the states of Ohio and Indiana; and W. by Lakes Michigan and Wisconsin, and has an area of 56,243 square miles, or 35,995,520 acres. It is divided into 73 counties. The capital is Lansing; the chief towns are Detroit, Ann Arbor, Monroe, Grand Haven, Kalimazoo, Marshall, &c. The state is divided by Lakes Michigan and Huron into two irregular peninsulas—the upper, a wild and rough region of mountains and forests, containing about one-third the area of the state, lies between the northern portions of Lakes Michigan and Huron, and Lake Superior; while the lower is nearly enclosed in a vast horse-shoe bend of Lakes Michigan, Huron, Erie, and the connecting straits and rivers. In the upper peninsula are the Porcupine Mountains, rising to a height of 2000 feet, with sandy plains and forests. The southern is a level, rich, fertile country of prairies and oak-openings, watered by numerous rivers, as the Grand, Kalimazoo, Muskegon, Saginaw, &c. The lower peninsula is of limestone strata, with coal and gypsum; the upper, of azoic formations, with metamorphic slates, gneiss rocks, trap, and rich mines of copper and iron. The climate is mild in the southern, and cold and bleak in the northern regions. The southern portion produces wheat, maize, fruits, butter, cheese, and wool in great abundance. Vast quantities of pine-lumber are exported from the northern half of the state. The principal manufactures are flour and woollens. The extensive coast and rivers afford great facilities to navigation, while four railways traverse the state. The government is similar to those of the other states, and the school-system is based on that of Prussia, with abundant revenues from public lands. The university of M. at Ann Arbor has 34 professors, and a foundation of 1,000,000 acres of land. The only charge to students is 10 dollars admission, and 5 dollars annual fee.—Detroit was settled by French in 1610, who also established a trading Mackinaw at about the same period. The took Detroit in 1812, but restored it at the

end of the war. The state was admitted to the Union in 1837. Pop. in 1840, 212,267; in 1850, 397,654; in 1860, 749,112; in 1870, 1,184,226.

**MICHIGAN**, a lake in the United States of America, the second in size of the five great fresh-water lakes, and the only one lying wholly in the United States, having Michigan on the N. and E., and Wisconsin on the W. It is 320 miles long 70 miles in mean breadth, and 1000 feet in mean depth. It is 578 feet above the level of the sea, and has been found by accurate observations to have a lunar tidal wave of three inches. It is the outlet of numerous rivers, and is connected by a canal, and sometimes by flooded rivers, with the Mississippi, which is believed to have been its ancient outlet. Its principal harbours are those of Chicago, Milwaukee, and Grand Haven; and its bold and, at certain seasons, dangerous shores are guarded by 23 light-houses. It forms, with the lower lakes and the St Lawrence, a natural outlet for one of the richest grain-growing regions in the world.

**MICROCOSM AND MACROCOSM.** The belief, current in ancient times, that the world or cosmos was animated, or had a soul (see ANIMA MUNDI), led to the notion, that the parts and members of organic beings must have their counterparts in the members of the cosmos. Thus, in a hymn ascribed to Orpheus, the sun and moon are looked upon as the eyes of the animating godhead, the earth and its mountains as his body, the ether as his intellect, the sky as his wings. The natural philosophers of the 16th c.—Paracelsus at their head—took up this notion anew in a somewhat modified shape, and considered the world as a human organism on the large scale, and man as a world, or cosmos, in miniature; hence they called man a *microcosm* (Gr. little world), and the universe itself, the *macrocosm* (great world). With this was associated the belief, that the vital movements of the microcosm exactly corresponded to those of the macrocosm, and represented them, as it were, in copy; and this led naturally to the further assumption, that the movements of the stars must exercise an influence on the temperament and fortunes of men. See ASTROLOGY.

**MICROCOSMIC SALT** is a tribasic phosphate of soda, oxide of ammonium, and water, which crystallises with 8 equivalents of water, its formula being  $\text{NaO}, \text{H}_2\text{NO}, \text{HO}, \text{PO}_3 + 8\text{Aq}$ . It is prepared by mixing a hot solution of 6 parts of phosphate of soda with a concentrated solution of 1 part of muriate of ammonia, when the microcosmic salt crystallises in large transparent prisms, while common salt remains in solution. On the application of heat, it first loses its water of crystallisation, and then its oxide of ammonium and basic water, so that only metaphosphate of soda remains, which, from its ready fusibility into a colourless glass, is valuable as a flux in blow-pipe experiments. See BLOW-PIPE. This salt occurs in decomposed urine.

**MICROLESTES** (Gr. little robber), a genus of fossil insectivorous mammals, whose remains supply the earliest evidence of the existence of warm-blooded quadrupeds on the globe. As yet, nothing but a few teeth have been found, in the bone-beds of the Upper Triassic system in Wurtemberg, and of apparently the same age near Frome, in Somersetshire. They apparently belonged to small insectivorous animals, but no living quadruped presents any close affinity to them.

**MICROMETER** (Gr. *mikros*, little; *metron*, measure) is an instrument used for the measurement of minute distances and angles. There are many different forms of micrometer, depending on different principles, but they may be divided into two

# MICROMETER—MICROSCOPE.

according as they are applied to Physics or Astronomy. Of the former section are the (q. v.) and the Micrometer Screw, the latter being merely a screw with a very regular and a large round head, which is carefully graduated, generally to sixtieths, and furnished with a fine index.

It is easily seen that if one complete turn of the screw advance its point  $\frac{1}{60}$ th of an inch, an index sufficient to pass the index from one mark to another will only advance it  $\frac{1}{600}$ th of an inch, &c. This is the micrometer used in the graduation of instruments. Of instruments which are applied to astronomical purposes, the simplest is a short tube, across the opening of which are stretched two parallel threads, which serve to approach or recede from each other by means of screws. These two threads are crossed at right angles perpendicularly, and the whole apparatus is placed in the focus of a lens. The distance of the threads is found by adjusting the two parallel threads so as to pass through the centre of each of the stars, and finding how many turns of the screw are necessary to bring the wires to coincide. The angle subtended by two stars is also obtained by turning the instrument till the third wire, which is horizontal, bisects both stars, and reading the circumference the arc passed over.

*Mr. Herschel's suspended annular micrometer* consists of a steel ring surrounded by a flat glass plate, and the position of the star is deduced from the time when it crosses the ring and its distance within it. In the commencement of the last century, the Abbé Rochon substituted a wire micrometer one constructed of two pieces of rock-crystal or Iceland spar, substances which possess double refraction. These prisms were cemented together with their axes of crystallisation at right angles to each other, to increase the deviation of the images, and the micrometer thus constructed was placed within the focus of the objective of a telescope, thus giving two images to be seen by the eye-piece. The distance between the images depends on the relative positions of the micrometer, and the object; and consequently after the instrument has been graduated, it is required to determine the apparent distance of a heavenly body, is to move the crystal prisms either forwards, till the two images appear to coincide, and the graduation corresponding to the coincidence, gives the required result. This micrometer has been improved by Arago, and others.

Other micrometers, particularly several of Mr. Herschel's, might be mentioned, but their principles are very similar to those above described.

**MICROSCOPE** (Gr. *mikros*, small, and *skopeo*, to examine), an instrument for enabling us to examine objects which are so small as to be almost or quite invisible by the unaided eye. Its early history is obscure; but as it is quite evident the property of magnification possessed by the lens must have been known as soon as it was made, we are quite safe in ascribing its existence in its simplest form to a period considerably anterior to the time of Christ. It is generally believed that the first compound microscope was made by Zacharias Jansen, a Dutch spectacle-maker, in the year 1590, and was exhibited to James Gregory by his astronomer, Cornelius Drebbel, in 1620.

It was then a very imperfect instrument, and distorted all objects. For many years it was more a toy than a useful instrument, and it was not until the invention of the achromatic microscope by Dollond, and its application to the microscope by Lister and others, that it reached the

advanced position it now occupies among scientific instruments.

An object to be magnified requires simply that it be brought nearer to the eye than when first examined, but as the focal distance of the eye ranges from 6 inches to 14 inches—10 inches being the average focal distance—it follows that a limit to the magnifying power of the eye is attained whenever the object to be examined is brought so near. If, however, we blacken a card, and pierce a hole in it with a fine needle, and then examine a minute object, as, for instance, the wing of an insect held about an inch from the card, we shall see it distinctly, and that too magnified about ten times its size. This is explained by the fact, that the pin-hole limits the divergence of the pencil of rays, so that the eye can converge it sufficiently on the retina to produce a distinct impression, which is faint; and did not the blackened card exclude all other light, it would be lost. If we now remove the blackened card without either removing our eye or the object under examination, it will be found that the insect's wing is almost invisible, the unassisted eye being unable to see clearly an object so near as one inch; thus demonstrating the blackened card with the needle-hole in it to be as decided a magnifying instrument as any set of lenses.

By the apparent size of an object is understood the angle formed by two lines drawn from the centre of the eye to the extremities of the object, which is larger when the object is nearer the eye than when further removed. This angle is called the angle of vision, and is quite distinct from the angle of the pencil of light, by which the object is seen. The focal length of a lens determines its magnifying power. The object to be examined is placed in its focus, so that the light which diverges from each point may, after refraction by the lens, proceed to the eye in lines as nearly parallel as is necessary for distinct vision. Thus, in fig. 1, AB is

Fig. 1.

a double convex lens, in the focus of which we have drawn an arrow, EF, to represent the object under inspection. The cones drawn from its extremities are portions of the rays of light diverging from these points, and falling on the lens. These rays, if not interrupted in their course by the lens AB, would be too divergent to permit their being brought to a focus upon the retina by the lenses which constitute the eye. But as they are first passed through the lens AB, they are bent into nearly parallel lines, or into lines diverging from some points within the limits of distinct vision, as from CD. Thus bent, these rays are received by the eye as if proceeding from the larger arrow CD, which we may suppose to be ten inches from the eye, and then the ratio of the length of the virtual image to that of the real arrow (nearly 10 to 1) gives the magnifying power of the lens in question. The ratio of CD to EF is the same as that of HG to KG. Now, HG is the distance of distinct vision, and KG the focal length of the lens, so that the magnifying power of a lens is obtained by dividing the distance of distinct vision (ten inches for most

# MICROSCOPE

individuals) by its focal length. Thus, if the focal length of a lens be  $\frac{1}{4}$  inch, the magnifying power is  $\frac{10}{\frac{1}{4}} = 40$ . This supposes that the distance between the eye and the lens is so small as not materially to interfere with the correctness of this statement.

We have supposed the whole of the light to enter the eye through the lens AB (fig. 1), but we must now state that so large a pencil of light passing through a single lens would be so distorted by its spherical figure, and by the chromatic dispersion of the glass, as to produce a very indistinct and imperfect image. This is so far rectified by applying a stop to the lens, so as to allow only the central portion of the pencil to pass. But while such a limited pencil would represent correctly the form and colour of the object, so small a pencil of light is unable to bear diffusion over the magnified picture, and is therefore incapable of displaying those organic markings on animals or plants which are often of so much importance in distinguishing one class of objects from another. Dr Wollaston was the first to overcome this difficulty, which he achieved by constructing a doublet (fig. 2), which

Fig. 2.

consists of two plano-convex lenses, having their focal lengths in the proportion of 1 to 3, and placed at a distance best ascertained by experiment. Their plane sides are placed towards the object, and the lens of shortest focal length next the object.

By this arrangement, the distortion caused by the first lens is corrected by the second, and a well-defined and illuminated image is seen. Dr Wollaston's doublet was further improved by Mr Holland, who substituted two lenses for the first in Dr Wollaston's doublet, and retained the stop between them and the third. This combination, though generally called a triplet, is virtually a doublet, inasmuch as the two lenses only accomplish what the anterior lens did in Dr Wollaston's doublet, although with less precision. In this combination (fig. 3) of lenses, the errors are still further reduced by the close approximation of the lenses to the object, which causes the refractions to take place near

Fig. 3.

the axis, and thus we have a still larger pencil of light transmitted, and have also a more distinct and vivid image presented to the eye.

**Simple Microscope.**—By this term we mean an instrument by means of which we view the object through the lens directly. These instruments may be divided into two classes—those simply used in the hand, and those provided with a stand or frame, so arranged as to be capable of being adjusted by means of a screw to its exact focal distance, and of being moved over different parts of the object. The single lenses used may be either a double convex or a plano-convex. When a higher power is wanted, a doublet, such as we have already described, may be employed, or a Coddington lens,

Fig. 4.

which consists (fig. 4) of a sphere in which a groove is cut and filled up with opaque matter. This is perhaps the most convenient hand lens, as it matters little, from its spherical form, in what position it is held. In the simple microscope, single or combined lenses may be employed, varying from a quarter to two inches. There are many different kinds of stands for simple microscopes made, but as they are principally used for dissection, the most important point next to good glasses is to secure a firm large stage for supporting the objects under

examination. When low powers alone are used the stage-movements may be dispensed with; but when the doublet or triplet is employed, some more delicate adjustment than that of the hand is necessary.

**Compound Microscope.**—In the compound microscope the observer does not view the object directly but an inverted image or picture of the object formed by one lens or set of lenses, and that image is seen through another lens. The compound microscope consists of two lenses, an object-glass and an eye-glass; but each of these may be compounded of several lenses playing the part of one, as in the simple microscope. The eye-glass is that placed next the eye, and the object-glass that next the object. The former is also called the ocular, and the latter the objective. The object-glass is generally made of two or three achromatic lenses, while the eye-piece generally consists of two plano-convex lenses, with their flat faces next the eye and separated at half the sum of their focal lengths with a diaphragm or stop between them. Lenses of high power are so small as to admit only a very small beam of light, and consequently what is gained in magnifying power is often worthless from defective illumination. Various devices have been employed to overcome this difficulty. The light may be concentrated by achromatic condensers placed beneath the stage, or the curvature of the lens may be made as to allow as large a number of divergent rays as possible to impinge upon it. Such a lens is said to have a large 'angle of aperture,' the angle of aperture being that made by two lines converging from the margins of the lens to its focal point. Recent lenses, termed 'immersion lenses,' have been constructed, of such a curvature that when immersed in a drop of water placed over the object, light is admitted on all sides. With an immersion lens, there is high magnifying power with sufficient illumination.

The following diagram (fig. 5) explains the manner in which the compound microscope acts. We have here represented the triple achromatic objective, consisting of three achromatic lenses combined in one tube, in connection with the eye-piece, which consists of the field-glass FF, and the eye-glass EE. Three rays of light are represented as proceeding from the centre, and three from each end of the object. These rays would, if not interfered with, form an image at AA; but coming in contact with the field-glass FF, they are bent, and made to converge at BB, where the image is formed, at which place a stop or diaphragm is placed to intercept all light, except what is required to form a distinct image. From BB, the rays proceed to the eye-glass exactly as they do in the simple microscope, and as we have explained in fig. 1. The image therefore formed at BB is viewed as an original object by an observer through the eye-piece EE. The lens FF is not essential to a compound microscope; but as it is quite evident that the rays proceeding to AA would fall without the eye-lens EE, if it was removed, and only a part of the object would thus be brought under view, it is always made use of in the compound microscope.

Fig. 5.

## MICROSCOPE.

error is placed under the stage for reflecting light through the object under observation. The method of illumination by transmitted light is when the object is transparent. When opaque, reflected on the object by a bull's-eye lens, a condenser. The best instruments are furnished with six or seven object-glasses, varying in magnifying power from 20 to 2500 diameters. The sets supplied are three in number, each of which consists of two plano-convex lenses, between a stop or diaphragm is placed, half-way between the two lenses. As the magnifying power of a compound microscope depends on the product of the magnifying powers of the object-glass and the eye-piece, it follows that its power may be increased or diminished by a change in either or both of these.

In the mechanical arrangements, it is of great importance to have the instrument so constructed, that every facility is afforded for making observations, and easy means of adjustment, there should be great steadiness, without which, indeed, no satisfactory results will be obtained. These ends have been achieved in various ways, of which fig. 6 is one of the simplest: *a*,

Fig. 6.

brass stand, supported on three feet; *b*, mirror supported on trunnions; *c*, diaphragm, pierced with circular holes of various sizes, to regulate the admission to the object of reflected light from the mirror; *d*, stage-plate, on which the object is placed; *e*, screw, with milled head for fine adjustment; *f*, the object-glass or objective; *g*, brass tube in which the body of the instrument is moved, so as to effect the coarse adjustment; *h*, the eye-piece, or ocular.

The microscope has now become so important an instrument in education, that almost every department of science in which it can be employed has a microscopist to its particular kind of work, and a treatise explaining and illustrating its use; many branches of science have instruments of their own. Thus, chemists, anatomists, and natural philosophers, &c., have each an instrument which is as being peculiarly adapted for their fields of inquiry and observation. From this it is evident that the chemist, and natural philosophers, &c., have derived great assistance in studying the different kinds of crystals; for, by means of it, they can not only observe and recognise the great variety of forms that exist, but at any moment, and without trouble, they may witness the process of crystallisation, and leisurely study it. Those branches of science in which it is most used, and for which it is most useful, are anatomy, physiology, botany, medicine, mineralogy, and geology. In the study of medicine all medical men who aim at a full treatment of disease have fully recognised the microscope as an agent in diagnosis, especially in diseases of the kidneys. In the study of crime and the vindication of innocence, the microscope is as useful, as by means of it we can with certainty determine whether a suspicious stain, or instance, on the clothing of an individual

charged with murder, has been caused by blood or by another colouring-matter. In like manner, we can determine whether hair found in similar circumstances belongs to a human being or not. It has also enabled us to distinguish the difference existing between substances that have a similar chemical reaction (e.g., the various kinds of starch, as flour, potato, sago, &c.), and thus we are provided with an agent quick in detecting adulteration.

A few hints to amateur observers may not be out of place here. In choosing an instrument, the simpler it is the better. The essential point to attend to is, to have good glasses, which are tested by their power of shewing some very minute markings, such as we find on diatoms. The circumference of the field of view should not be tinged with colour, and the definition should be as good at the edge as at the centre. The beginner should use low powers in preference to high ones. The best light is that reflected from a white cloud during the day. Artificial light should, if possible, be avoided. The table must be steady on which the microscope is placed, and when not in use, the instrument should be covered by means of a glass shade. The observer also requires a few oblong glass slides, and a few circles of thin glass, called covering-glasses, to lay over the preparation under examination. For making sections, dissecting, and the various manipulatory operations attending the use of the microscope, he requires, moreover, a pair of forceps, a knife, or, perhaps better, a razor ground flat on the one side, a few needles fixed in handles, and two or three hair-pencils. So equipped, the observer is able to begin examinations of texture at once with pleasure and advantage. Begin with simple objects, such as pollen and thin slices of the cuticle of flowers, mosses, and different kinds of starch, such as *tous le mois*, buck yam, cycas, arrow-root, &c., and notice particularly their different characters. Make as thin a section as possible, place it on the centre of the slide, and allow a drop of water to fall on it from the end of the handle of the needle. Then allow the covering-glass to fall gently on it—obliquely, so as to press out any small bubbles of air. He should also have a few bottles containing 'reagents,' such as dilute acetic acid (equal parts of pyroligneous acid and water) and liquor potassæ. By means of these reagents, peculiarities of structure may often be observed.

Microscopes vary much in price, from 5s. to upwards of £100. A good serviceable dissecting simple microscope may be had from any philosophical-instrument maker for from 9s. to 15s. Compound microscopes are more expensive, but a wonderfully good instrument for beginners can be had at 30s. It has one eye-glass and three object-glasses, and magnifies from 70 to 200 diameters. If a superior instrument is wished—one suited for most purposes of observation and research—any one of the following will be found well worth the price:—The microscope of Hartnack, with a joint, so that it may be inclined at any angle, has two eye-pieces, two object-glasses, magnifies from 50 to 450 diameters, and costs £8, 10s.; Nachet's microscope has three eye-pieces, three object-glasses, magnifies from 50 to 750 diameters, and costs £10; Smith and Beck's educational microscope has two eye-pieces, two object-glasses, magnifies from 50 to 350 diameters, and costs £10; Ross supplies microscopes from £5 to £100, with various number of glasses.

For a more complete account of the different kinds of microscopes, and the various purposes to which they are applied, see Quekett *On the Microscope* (1855); Carpenter *On the Microscope* (1862); Hogg *On the Microscope* (1855); and *How to work with the Microscope* (1864), by Beale.

**MIDAS**, a common name of the more ancient Phrygian kings, of whom Midas, the son of Gordius and Cybele, is the most famous. He was a pupil of Orpheus. Among the many legends regarding him is one, that Bacchus granted his wish, that whatever he touched might become gold; from which so great inconvenience ensued, that he was glad to get himself relieved from the burden by washing, at the command of the god, in the Pactolus, the sands of which became thenceforth productive of gold. Another legend represents him as having offended Apollo by assigning the prize in a musical competition to Pan, and as having therefore been endowed by him with a pair of ass's ears, which he concealed under his Phrygian cap, but which were discovered by his servant.

**MIDDELBURG**, a town of the Netherlands, capital of the province of Zeeland, in the island of Walcheren. It is connected with the sea by a canal, five miles long, which admits ships of heavy burden, and is a station of the railway from Flushing to Roosendaal to join the Dutch and Belgian lines. Pop. (1st Jan. 1871) 16,580. The city is nearly circular, and a league in circumference, surrounded by a broad canal. In former times, M. was one of the leading mercantile cities of the United Provinces, sending many ships to the East and West Indies, America, and all European ports, founding the colonies of Surinam, Berbice, Essequibo, Demerara, &c.; but the opening of the Scheldt for Antwerp, and other causes, have reduced the foreign trade to single ships to Java. Many of the inhabitants are wealthy, which, with its being the meeting-place of the provincial states of Zeeland, and possessing a considerable trade in grain, salt, &c.—making beer, vinegar, starch, leather, having snuff, chocolate, oil and saw mills, and foundries—make it still a city of importance. It is the finest city of the northern provinces, having handsome houses, ornamented with gardens, and the canals and streets shaded with trees. The Town-house, founded in 1468, has a beautiful tower, and is decorated with 25 colossal statues of Counts and Countesses of Holland. At the beginning of the 12th c., an abbey was founded, which was, later, enriched by Willem II., Count of Holland and Zeeland. The buildings are now occupied as the meeting-place of the provincial states.

M. does not date further back than the 9th century. In 1574, the Spaniards, under Mondragon, were compelled by famine to give up M., after having defended it for 22 months against Prince Willem I. Though troops are stationed in M., it is no longer tenable against an enemy.

**MIDDLE AGES**, the designation applied to the great historic period between the times of classic antiquity and modern times. The beginning and close of this period are not very definite. It is usual, however, to regard the middle ages as beginning with the overthrow of the Western Roman Empire in the year 476; and there is a pretty general concurrence in fixing on the Reformation as the great event which brought this period to a close. It began with the rise of the Frankish upon the ruins of the ancient Roman Empire, and with the commencement of civilisation among the barbarous tribes which had taken possession of the former Roman provinces. In course of it, the different nations of modern Europe were formed, and their political and social systems developed. It was a period of much superstition, in connection with which much religious enthusiasm very extensively prevailed, manifested in many great religious endowments, in magnificent ecclesiastical buildings, in pilgrimages, and, above all, in the Crusades. In

the earlier parts of this period, the Church was much occupied in the extension of its bounds in the north of Europe, where heathenism still subsisted, and the means employed were not always consistent with the spirit of Christianity. During the middle ages, the hierarchy acquired enormous power and wealth, and the papacy rose from comparatively small beginnings to its utmost greatness. During the middle ages, chivalry had its rise and decline, modifying, and in many respects tending to refine the feelings and usages of society. Towards the close of the middle ages, the revival of letters, the increase of knowledge, and the formation of a wealthy and influential class in society, distinct alike from the aristocracy and the peasantry, tended, even before the Reformation, both to the diminution of the power of the hierarchy and the decay of the feudal system. See Guizot's *Histoire de la Civilisation*; Rüh's *Handbuch der Geschichte des Mittelalters*; and Hallam's *History of the Middle Ages*.

**MIDDLE BASE AND MIDDLE CHIEF**. See POINTS OF ESCUTCHEON.

**MIDDLE LATITUDE SAILING**. See SAILINGS.

**MIDDLE TEMPLE**, one of the four English Inns of Court, having the exclusive privilege of calling persons to the bar. See INNS OF COURT.

**MIDDLESBROUGH**, the centre of the north of England iron manufacture, is an important market-town, port, and parliamentary borough in the North Riding of Yorkshire, at the mouth of the Tees, 48 miles N.E. from York, returning one member to parliament. The town is of recent growth, and owes its origin as a port to its convenient position for the shipment of coals brought down by railway from the mines in South Durham. In 1842, a commodious dock was constructed, which has recently been very considerably enlarged, and will admit ships of the largest tonnage.

On the discovery, in 1840, of immense beds of ironstone, extending throughout the whole range of the Cleveland Hills, a portion of which lies close to the town, the smelting of iron was speedily embarked in on an extensive scale, which has since increased to a marvellous extent, to which has been added iron-foundries, the manufacture of rails, locomotive engines, tubes, boilers, &c.; chemical works, potteries, and ship-building are also carried on to a large extent. The town of M. was incorporated in 1853, and constituted a parliamentary borough in 1868, is well built, and some of the streets present handsome specimens of architecture. The Royal Exchange, built in 1867, is a large and handsome building; within its spacious interior, the weekly iron market is held on Tuesdays, and is attended by parties connected with the iron trade from all parts of the kingdom, as well as foreigners. There are five churches of the national establishment, and numerous places of worship connected with the various religious denominations. Albert Park, containing 72 acres, is tastefully laid out.

At the census taken in 1831, M. was an obscure hamlet with 383 inhabitants; in 1871, the parliamentary borough contained a population of 46,643, and at the present time (1874) it is estimated at upwards of 60,000.

**MIDDLESEX**, the metropolitan county of England, in the south-east of the country, bounded on the north by Hertford, and on the south by Surrey, and about 60 miles inland (westward) from the North Sea, with which it communicates by the river Thames. Next to Rutland, it is the smallest of the English counties, its area being only 180,136 statute acres; but its population is inferior only to that of Lancashire, and was, in 1871, 2,539,756. The sur-

# MIDDLETON—MIDRASH.

face is on the whole level, with gentle undulations. The Thames, which forms its southern boundary, and its affluents, are the only rivers of the county. Two of these, the Colne and the Lea, form respectively the western and the eastern boundaries of the county. The surface is also traversed by the Grand Junction and Regent's Canal, and the New River, an artificial cut intended to supply the capital with water. The soil is in general poor, with the exception of a tract along the banks of the Thames, which consists of a good fertile loam. The county is chiefly occupied in grass and hay farms, and in market-gardens, the produce of which is sent to supply the metropolis. Parliamentary elections of members for Middlesex are held at Brentford, which is the county town. There are no other towns of importance except London.

**MIDDLETON**, a small manufacturing town of Lancashire, six miles north-north-east of Manchester. Pop. (1861) 9876; (1871) 14,587. It is chiefly dependent upon its manufactures of cotton cloth and silks.

**MIDDLETON**, a small decaying market-town of Ireland, in the county of Cork, and 13 miles by railway east of the city of that name. It contains a college founded in 1696, noticeable as the place in which John Philpot Curran was educated, and still of considerable reputation, and carries on a general trade. Pop. (1871) 3689.

**MIDDLETON, CONYERS, D.D.**, a well-known divine and scholar of the Church of England, was born in 1683, at Richmond, in Yorkshire. He studied at Cambridge, where he took the degree of B.A. in 1702, was elected a fellow in 1706, and shortly after married a lady of fortune. His life was a series of bitter, and, on the whole, not very creditable controversies, though he is said to have been rather a likeable person in private. His first and most formidable opponent was Richard Bentley (q. v.); afterwards, his polemics were chiefly of a theological character. The views he expressed and defended were generally such as to draw down upon him the imputation of being an 'infidel in disguise,' though some of them—such as that the Jews borrowed some of their customs from Egypt, and that the primitive writers in vindicating Scripture found it necessary sometimes to recur to allegory—are now established beyond all doubt; while a third opinion, viz., that the Scriptures are not of absolute and universal inspiration, has since M.'s day been adopted by many of the most learned and accomplished divines even of his own church. M. died at Hildersham, in Cambridgeshire, July 28, 1750. His principal writings are *The History of the Life of M. Tullius Cicero* (2 vols. 1741), a work both interesting and valuable, but neither very impartial nor quite accurate. His celebrated *Letter from Rome, shewing an exact Conformity between Popery and Paganism; or the Religion of the present Romans derived from that of their Heathen Ancestors* (1729), provoked the most violent indignation among Roman Catholics, and is still read with interest. All his pamphlets, treatises, &c. were collected and published under the title of *Miscellaneous Works* (4 vols. Lond. 1752—1757), and contain much that is curious and valuable on theological and antiquarian topics.

**MIDDLETOWN**, a city and township in Connecticut, United States of America, at the head of navigation, on the right bank of the Connecticut River, 23 miles from its mouth. It is a well-built town, with a handsome custom-house, Wesleyan university, episcopal seminary, 16 churches, 4 banks, cotton factories, foundries, mills, &c. Pop. of city in 1871, 11,143.

**MIDDLEWICH**, a small market-town of England, Cheshire, on the Grand Trunk Canal, 20 miles

east of Chester. Salt is extensively made; boat-building is carried on, and brick-works are in operation. Pop. (1871) 3085.

**MIDGE**, the common name of many species of small dipterous insects, of the family *Tipulidae*, much resembling gnats, but having a shorter proboscis. Their larvæ are aquatic; the perfect insects are often very annoying both to human beings and to cattle. The little pink-coloured tortuous worm known to anglers as the *Blood-worm*, frequent in water-barrels and in the mud near the edges of ponds and ditches, is the larva of a species of M. (*Chironomus plumosus*), a little larger than the common gnat, very abundant in Britain, particularly in marshy situations. The larva is much sought after both by birds and fishes, and is a very tempting bait for the latter. The pupa is cylindrical, with respiratory organs on the sides of the thorax. When the insect is ready to quit its pupa case, it rises to the surface of the water, and there remains suspended for a short time; the perfect insect, when it has issued from the case, also stands for a short time on the surface of the water. The genus is remarkable for the long hairs with which the antennæ of the male are furnished.—Another genus of Midges (*Simulia*) contains many species which are most tormenting to men and cattle, by entering the ears and nostrils, and alighting on the eyelids. Several species are British. They swarm on marshes and damp heaths in the warmer months. But none of them is nearly so mischievous as a species (*S. columbaschensis*) found on the banks of the Danube, and so plentiful, that horses and cattle are often suffocated by the numbers which get into the wind-pipe.

**MIDHURST**, a market-town and parliamentary borough of England, in Sussex, on the Rother, a navigable tributary of the Arun, 50 miles south-west of London. Here are the ruins of an old castle of the Bohuns, lords of M.; and within half a mile east of the town stood Cowdry House, the seat of the Montagues, which, with the exception of the gatehouse, was burned down in 1793. M. returns one member to parliament. Pop. (1861) of parliamentary borough, 6405; (1871) 6753.

**MIDIANITES**, an Arab race, descended, according to Scripture, from Midian, the son of Abraham by Keturah. They occupied the greater part of the country between the north side of the Arabian Gulf and Arabia Felix as far as the Plains of Moab. Others more civilised (if not, indeed, of Cushite origin) dwelt in the vicinity of the Sinaitic peninsula, and carried on a trade, particularly with Egypt. To the latter, we may presume, belonged Jethro, priest or 'sheik' of Midian—the father-in-law of Moses. The M. were very troublesome neighbours to the Israelites till Gideon's victory over them. Their national god was Baal-Peor.

**MIDRASH** (Heb. *darash*, to search, explain the Scriptures) is the general name given to the exposition of the Old Testament, which, for about 1500 years, formed the centre of all mental activity, both in and out of the schools, among the Jews after the Babylonish exile. The prohibitions and ordinances contained in the Mosaic records, to which a precise meaning was, not in all cases, attached, were, according to certain hermeneutical rules, specified and particularised, and further surrounded by traditional ordinances and inhibitions: Halacha (q. v.) = rule by which to go, or the binding, authoritative, civil, and religious law. The chief codes of this are the Mishna (q. v.), Gemara (q. v.), Sifra (an amplification on Leviticus), Sifri (on Numbers and Deuteronomy), and Mechilta (on a portion of Exodus). Another branch of

the Midrash, however, is the Haggada (q. v.), a kind of free poetical homiletics on the whole body of the Old Testament (the Halacha being chiefly confined to the Pentateuch). The chief collections of that part of the Midrash are Midrash Rabba, 700—1100 A.D. (on Pentateuch and Megilloth), and Pesikta (700), the extracts from which (Jalkut, Pesikta Rabbati, Sutura, &c.) only are known, the original itself never having been printed.

**MIDSHIPMAN**, the second rank attained by combatant officers in the royal navy. After two years' service as naval cadet, the aspirant becomes a midshipman, which is rather an apprenticeship for his after-naval career than any really effective appointment. The midshipman's time is principally devoted to receiving instruction, both in the ordinary subjects of a gentleman's education, and in the special professional duties of a naval officer. After 1½ years' service as such, the midshipman is required to pass a qualifying examination in geography, history, and general knowledge; and, two years later, he must pass in French conversation, and in seamanship, steam, and gunnery. He then becomes a Sub-lieutenant (q. v.); and if 19 years of age, is eligible for promotion to lieutenant, whenever opportunity offers.

A midshipman only receives 1s. 9d. a day (£31, 18s. 9d. per annum); he is consequently dependent on his friends for more or less pecuniary assistance until he becomes a sub-lieutenant.

**MIDSUMMER DAY**, one of the four English quarter-days for payment of rent by tenants, viz. 24th June. See **LANDLORD AND TENANT**.

**MIDSUMMER EVE**. See **JOHN'S (ST) EVE**.

**MIDWIFE, MIDWIFERY**. Midwife (Anglo-Saxon, *med-wif*, meaning probably a woman hired for *mede*, or reward) is the name applied to a woman who assists in parturition or delivery. From this is derived the term *Midwifery*, for that department of medical science which concerns itself with delivery, and its allied subjects. Writers who prefer words derived from Latin and Greek roots to such plain old English words as midwifery, have substituted for it *Obstetrics* (Lat. *obstetric*, a woman who stands near, a midwife), and *Tokology* (Gr. *tokos*, child-birth), or *Gynaecology* (Gr. *gynē*, woman); for a male practitioner in this line of the medical art, the French name *accoucheur* is used; and recently, an obnoxious new verb, *to accouch* (Fr. *accoucher*, to deliver a woman), has made its appearance in medical literature.

Midwifery, as a branch of medical science, is understood to include the study of the anatomy of the parts of the female body concerned; the doctrine of conception and of sterility, and the signs and duration of pregnancy; parturition in all its varieties; and the diseases peculiar to the puerperal state. To enter into details of such matters, would be out of place in this work. With regard to parturition itself, it may be interesting to remark, that in a vast majority of cases the labour is what is called 'natural'; that is, the child presents itself in the normal position, and unaided nature completes the delivery within twenty-four hours with safety to the mother and child. Dr Smellie calculated that 990 in 1000 are 'natural' labours; and the later statistics of Dr Collins, based on 15,850 cases, give a similar result—viz., 983 in 1000.

'Unnatural' labour arises either from malformation, disease, or weakness on the part of the mother, or from abnormal conditions of the child; and manual or instrumental aid becomes necessary to prevent the labour from being dangerously prolonged, or—in the more extreme cases—to render delivery at all possible. Of instrumental applica-

tions, by far the most important and frequent is that of the Forceps (q. v.), which is not intended to injure either mother or child. In 123,295 cases of labour attended by British practitioners, there were 342 forceps cases, or 1 in 360; of these, about 1 in 21 proved fatal to the mother, while 1 child in 4 was lost. In Craniotomy, the head of the child is intentionally destroyed, with a view to save the life of the mother, the death of both being otherwise inevitable. Among British practitioners, this operation is not often resorted to; it proves fatal to about one mother in 5½. See also **CÆSAREAN OPERATION**.

**History**.—From all the passages in the Scriptures where midwifery is referred to, it is plain that women were the only practitioners of this art amongst the Hebrews and the Egyptians (see Gen. xxxv. 17, and xxxviii. 28, and Ex. i. 15—21), and it is equally certain that the Greeks and Romans confided this branch of medicine to women. Phanarete, the mother of Socrates, was a midwife; and Plato explains the functions and mentions the duties undertaken by these women. The Greek and Roman physicians were not ignorant of midwifery, for Hippocrates refers to the necessity of turning the child in certain cases, although his doctrines on this point, as also on the management of the placenta, are replete with danger; and Celsus, nearly two centuries later, treats of the mechanism of labour with great clearness. A gradual increase in the knowledge of this subject may be traced in the writings of Aëtius and Paulus Ægineta, who advocate the operation of craniotomy in certain cases. Rhazes seems to have been the first to advocate the rupture of the membranes, when, by their toughness, they impede labour; and Avicenna gave the first description of an instrument partially resembling the more modern forceps.

At the commencement of the 16th c., Escharius Rhodion published a little book, which soon acquired a great celebrity. It was translated from the original High-German into Latin, French, and English, and is remarkable as being the first book published on this subject in England. Its title is, *The Byrth of Mankynde, otherwise named the Woman's Book*, by Thomas Raynold, Physician (London, 1540), and it contains no external evidence that it is a mere translation. In 1573, Ambrose Paré published a small work, in which he showed that foot-presentations were not dangerous, and that in mal-presentations it was better to deliver by the feet than to attempt to bring down the head.

In the early part of the 17th c., the *accoucheur* (the French term corresponding to our English midwife) of Marie de Medicis published a collection of observations on midwifery. About this time (probably about 1640), Dr Paul Chamberlen, an English physician, invented\* the forceps with separate blades, such as are now used. The Chamberlen family (the father and three sons) did not, however, publish their discovery; considering that they had a right to use the secret in the way most to their own advantage; and the exact nature of their instruments was not known till 1813, when the tenant of a house near Maldon, in Essex, where Dr Peter Chamberlen, one of the sons, had resided more than a century previously, accidentally discovered a concealed space, in which were, *inter alia*, a collection of obstetric instruments, including a double-bladed forceps and a vectis, which are now in the possession of the London

\* The exact date of this important invention is not known, but in 1647, Dr Peter Chamberlen published a pamphlet entitled *A Voice in Rhama*, in which he speaks of his father's (Dr Paul Chamberlen) discovery for the saving of infantile life. Hence the forceps must have been invented in the first half of the 17th century.

## MIGNET—MIGRATIONS OF ANIMALS.

Medico-Chirurgical Society. Although Chamberlen's celebrated *arcanum* was doubtless the double-bladed forceps, he seems, therefore, also to have been the discoverer of the vectis or lever. In 1668, Mauriceau's Treatise appeared, which ran through seven editions, and was for a long time the standard work on the subject. He gives a very full account of the process of labour; and his book having been translated into English, in 1672, by Hugh Chamberlen, became widely known in this country. This seems to have been the time when men began to engage generally in the practice of midwifery; Harvey, the Chamberlens, and others, taking it up in England; while La Vallière, the mistress of Louis XIV., did much to establish the practice in France, by employing Julian Clement, a surgeon of high reputation, in her first confinement in 1663.

The last point requiring notice in the history of midwifery in the 17th c., is the discovery of the use of ergot of rye in accelerating parturition. In 1688, Camerarius stated that midwives in some parts of Germany were in the habit of employing it for this purpose; but it is not till 1774 that we find any further reference to the use of this drug.

In the early part of the 18th c., different varieties of forceps, closely resembling Chamberlen's instrument, were invented by Giffard, Chapman, and others; Chapman being, as it is believed, the first public teacher of midwifery in London. About the middle of this century, lived Sir Richard Manningham, who devoted himself to this branch of the profession, and established a small hospital for the reception of parturient women, which was the first of the kind in the British dominions. It is scarcely necessary to enter into further historical details, as midwifery was by this time fully recognised as a branch—although then and long subsequently, considered as the lowest branch—of medicine. The names of Smellie, William Hunter, Denman, and Bland in England, and of Astruc and Baudelocque in France, are well-known as promoters of various departments of the art of midwifery towards the close of this century.

In the present century, the art of midwifery has steadily progressed. The by-laws precluding practitioners in midwifery from the Fellowship of the London College of Physicians, and other equally offensive rules in other institutions, have been repealed; there are professors of, or lecturers on midwifery in all our medical schools (excepting at the universities of Oxford and Cambridge); and a knowledge of this department of medicine is now required from every candidate for the medical profession. And not only are the members of the medical profession compelled to be as well versed in midwifery as in medicine or surgery, but the ignorant midwives of past times are now replaced by comparatively well-educated nurses, with diplomas, certifying that they have regularly attended lectures on midwifery, and have taken personal charge of a certain number of labours, under the superintendence of a qualified teacher. And that properly educated women are capable of undertaking all the responsibilities of this department of practice, is shown by such cases as those of Mesdames Boivin and Lachapelle, who (to use the words of Professor Velpeau), 'although the pupils of Baudelocque, were not afraid to shake off, to a certain extent, the yoke of his scientific authority, and whose high position and dignity form the starting-point of a new era for the science of obstetrics in Paris.'

MIGNET, FRANÇOIS AUGUSTE ALEXIS, a French historian, was born 8th May 1796, at Aix in Provence, studied law in his native city along with Thiers, and went to Paris in 1821, to devote himself to a literary life. He found employment in writing for

the public journals, and having given lectures on Modern History, which were received with great approbation, he was induced to write his *Histoire de la Révolution Française* (2 vols. Par. 1824; 10th edition, 1840), a work in which that great event is regarded less in its moral than its philosophical aspects. It has therefore been reproached with leading to fatalism. His style is brilliant, but academic. After the revolution of 1830, he became a Counsellor of State, and Keeper of the Archives of the Ministry of Foreign Affairs; but lost these offices in 1848, since which time he has lived in retirement. He has edited *Négociations relatives à la Succession d'Espagne sous Louis XIV.* (4 vols. Par. 1836—1842), to which he prefixed a masterly historic introduction. Among his later works are *Histoire de Marie Stuart* (2 vols. Par. 1851), and *Charles Quint, son Abdication, son Séjour et sa Mort au Monastère de Yuste* (1854); *Eloges Historiques* (1864). For more than thirty years he has been engaged on a *Histoire de la Réforme, de la Ligue et du Règne de Henri IV.*, in the preparation of which he is said to have collected hundreds of volumes of manuscript correspondence.

MIGNONETTE (*Reseda odorata*), a plant of the natural order *Resedaceae*, a native of the north of Africa, in universal cultivation on account of the delicious fragrance of its flowers. It is, according to circumstances and the mode of cultivation, an annual or a perennial, and even half-shrubby plant, with lanceolate entire or trifid leaves, and erect terminal racemes of small whitish flowers, which have the calyx 6-parted, and as long as the corolla; the capsules 3-toothed. It is to be seen during summer in almost every garden, and during winter in almost every green-house in Britain; it is often cultivated in flower-pots in apartments, and no flower is so common in the boxes which are placed outside of windows in towns. Yet it was first introduced into England by Lord Bateman, who brought it from the Royal Garden at Paris in 1752; nor had it then been long known in France. It rapidly became a universal favourite throughout Europe. The French name *M.*, now its popular name everywhere, signifies *Little Darling*. What is called *Tree M.* is not even a distinct variety, but merely the common kind trained in an erect form, and prevented from early flowering by pinching off the ends of the shoots.—Weld (q. v.) belongs to the same genus.

MIGRATIONS OF ANIMALS, which must not be confounded with their diffusion over a more or less extended area, are apparently always guided by an instinct operating on all, or nearly all, the individuals of a species, and leading them to move in a definite direction in search of food or (in the case of fishes) of a fit position for spawning.

Among mammals, such migrations are comparatively rare. The most remarkable instance is that of the Lemmings, which at no definite epochs, but generally once or twice in a quarter of a century, traverse Nordland and Finmark in vast hosts, ending their career in the Western Ocean, into which they enter, and come to a suicidal end; or, taking a direction through Swedish Lapland, are drowned in the Gulf of Bothnia. M. Martins, who was a member of the great scientific Scandinavian expedition, seems to doubt the generally entertained view of these animals casting themselves into the Western Ocean, and believes that most of them perish from the cold in crossing the rivers, while many are killed by dogs, foxes, and a species of Horned Owl (*Strix brachyotos*), which in large numbers always accompanies these emigrations.

According to Gmelin, the Arctic Fox (*Vulpes lagopus*) always accompanies the lemmings in such

numbers that, on this ground, it is entitled to be considered a migratory animal; but independently of these special migrations, it is stated by Sir James Ross that 'the young generally migrate to the southward late in the autumn, and collect in vast multitudes on the shores of Hudson's Bay; they return early the following spring to the northward, and seldom again leave the spot they select as a breeding-place.'

The Spring-bok (*Antidorcas Eucore*) is accustomed to make pilgrimages from one spot to another in the vast plains of Southern Africa. Herds of many thousands are led by their chiefs in these migrations, and the wonderful density of the moving mass may be imagined from the fact, that a flock of sheep has been inextricably entangled and carried along, without the possibility of escape. Want of water is said to be the cause of these migrations, but Dr Livingstone thinks that there must be other causes.

The occasional incursions of wolves, in very severe winters, into districts in which they are not commonly found, and the long excursions of large groups of monkeys (*Entellus* and *Rhesus*), hardly fall within the scope of this article.

Many of the cetacea are probably migratory. 'The migrations of the Porpoise (*Phocena communis*) appear—says Marcel de Serres in his prize-essay, *Des Causes des Migrations des divers Animaux*, p. 63—to be as periodic as those of certain species of birds. During the winter, they constantly proceed from north to south; and when they feel the warmth of summer, they turn northwards. Thus they are common in summer in Greenland, while they are rare on our own coasts, where they abound in winter.'

The number of species of birds that periodically migrate is so great that it is impossible to find space for a list of them. Marcel de Serres, in the work already quoted, gives a 'Tableau de l'Epoque des Passages des Oiseaux,' which extends over nearly 100 pages. See BIRDS OF PASSAGE. The desire for a suitable temperature, and the search for their proper food, are the apparent causes stimulating birds to these migrations; and in most instances, especially in the case of insectivorous birds, the food is intimately associated with the temperature.

The migrations of many species of fishes are as remarkable for their regular periodicity as those of birds. In some cases, fishes that are produced in fresh-water streams migrate to the ocean, and after spending some time in salt water, return (generally, with singular instinct, to their own birthplace) to fresh water to propagate their species. Some of these fishes—as, for example, the Lamprey (*Petromyzon marinus*)—spend most of their lives at sea, and others, as the salmon, in fresh water. The remarkable migrations formerly, but erroneously supposed to be made by herrings, are noticed in the article on that fish. Many fishes of the same family as the herring, the *Clupeidae*—as, for example, the sprat and pilchard—leave the deep sea for shallow water during the spawning period, when they approach our coasts in vast shoals. All such migrations as these seem mainly due to a reproductive impulse. See FISHES, LAND-CRAB.

Amongst insects, the Locust (*Locusta migratoria*) is most remarkable for its migrations. These insects are probably produced much more abundantly some years than others, and as in such years their birthplace cannot afford them sufficient vegetation, they are led to migrate in search of food. Some idea of the occasional extent of their wanderings may be formed from the fact that, in the early part of 1810, myriads of locusts appeared in Bengal, from whence they proceeded westward completely across the

great Indian peninsula to Guzerat and the neighbouring provinces, from whence they pursued their course southwards towards Bombay, the whole period of their migration extending over between two and three years; while, in relation to their numbers, Captain Beaufort calculated a swarm that appeared at Sardis, in Asia Minor, in 1811, at upwards of 168,000,000,000,000.

MIGUEL, DOM MARIA EVARIST, born at Lisbon 26th October 1802, was the third son of John VI. of Portugal. He spent his early years in Brazil, unrestrained and uneducated. When he returned with the royal family to Portugal in 1821, he could neither read nor write, and showed no talent for anything but fencing. He joined his mother, Charlotte Joachime of Spain, in her plots for the overthrow of the constitution and the establishment of a despotic government; part of the scheme being, that his weak father should be either formally deposed, or virtually deprived of all power. The aged Marquis of Loulé, the faithful servant of the king, having been removed out of the way by assassination, M., as Infant-generalissimo, caused the ministers to be arrested, 30th April 1824, and his father to be closely watched in his palace; but the plot failed, and M. and his mother were banished. He led for some time a remarkably wild and profligate life in foreign countries. After the death of his father in 1826, the queen's party set forth a claim to the throne on his behalf, as his elder brother, Dom Pedro, was emperor of Brazil; and on 24 May 1826, Pedro resigned the crown of Portugal in favour of his eldest daughter, Donna Maria da Gloria, proposing that her uncle Miguel should be her husband, and regent of the kingdom till her majority, to all which M. agreed. But Queen Joachime's party had everything prepared for the restoration of absolutism. M. was declared king of Portugal. War ensued, and at first M. was victorious. He carried into full effect the principles of his party by a system of the most severe repression of all liberalism, and signalled himself by the most extreme tyranny of every kind, whilst his own life was one of the wildest excess. In 1832, Dom Pedro took Oporto, and his arms gradually prevailing, M. was obliged to sign a capitulation at Evora, on 26th May 1834, by which he resigned all claim to the throne of Portugal, and agreed to retire altogether from the country. But scarcely had he been conveyed to Genoa, when he protested against this deed, and consequently all his estates in Portugal were confiscated, and an annual pension which had been secured to him was stopped. He went to Rome, where the papal government acknowledged him as rightful king of Portugal, solely because he had petted the Portuguese priesthood in his war against the national liberties. Latterly he lived at the castle of Bronnbach, in Baden, where he died Nov. 1866.

MIKLOSICH, FRANZ, the most learned living Slavist, was born at Lutzenberg, in the Slavic part of Styria, 20th November 1813. After studying law at the university of Grätz, he went, in 1838, to Vienna to practise as an advocate; but in 1844 obtained a situation in the Imperial Library. In 1850, he was appointed Professor of Slavic in Vienna. His principal works are—*Radices Lingue Palæoslovenicæ* (Leip. 1845); *Lexicon Lingue Palæoslovenicæ* (Vienna, 1850); *Vergleichende Grammatik der Slavic Sprachen* (Vienna, first vol. 1852), a work which has done for Slavic what the works of Grimm and Diez have done for German and Romance. *Les Noms propres Slaves* was published in 1860; and *Les Noms de Lieux Slaves* in 1865.

MIKNAS, MEQUINEZ, or MEKNAZA, a town in the province of Fez, in Morocco, 38 miles

est-by-south from the town of Fez, stands in a fertile valley near the Sebu. It is surrounded by triple walls, and a moat, is neat and well built, and contains the finest imperial palace in Morocco. This vast pile, erected by the Sultan Muley Ismail, is built of marble, and the surrounding grounds are laid out in gardens, said to be the most beautiful in Morocco, and here and there adorned with fountains. M. is the summer residence of the sultan. Pop. estimated at from 15,000 to 55,000, who carry on an extensive trade in native produce. The chief manufactures are of painted earthenware and leather. In the vicinity, are large plantations of olives.

**MILAN** (Ital. *Milano*), the chief city of Lombardy, stands on the river Olona, in the centre of the great plain of Lombardy. Pop. (1872) of city, 99,009; of surrounding district, called Corpi Santi, 32,976. From its position on the line of the chief routes of the central Alps, it derives great commercial advantages, while its fine canal-system opens for it communication with the principal rivers of Italy. The *Naviglio Grande*, or Grand Canal, connects M. with the Ticino, and the Martesana Canal with the Adda. The city, which is almost circular, is encompassed on three sides by walls and low ramparts; it has a circuit of about 7½ miles, and is entered by 10 gates. Notwithstanding its great antiquity, M. possesses but few remains of its early splendid structures, in consequence of the many calamitous wars by which it has been ravaged. Modern M. is one of the most opulent and populous cities of Italy; its best streets are regular, wide, and well paved, and kept with scrupulous care; the dwellings are commodious and tasteful, though of a less imposing character than the great feudal Tuscan houses. M. abounds in churches worthy of note: of these, the principal is the famous Gothic cathedral, the *Duomo*, which, with the exception of St Peter's in Rome, is the most magnificent ecclesiastical structure of Italy. It has a facade of white Carrara marble, and is adorned by 106 pinnacles, and 4500 statues, besides a variety of carvings of unsurpassable beauty. In form, it is a Latin cross, with a length of 485, and a breadth of 232 feet. The height of the dome is 355 feet. Its foundation was laid in 1386 by Gian Galeazzo Visconti, and during its erection, many of the greatest European architects contributed designs for its embellishment. Within it, Napoleon was crowned king of Italy in 1805. Besides the *Duomo*, may be mentioned the church of St Ambrose (founded by that saint in the 4th c.), the most ancient in M., containing inscriptions, sarcophagi, and monuments full of antiquarian interest, and the one in which the German emperors were crowned kings of Italy; the Dominican church of *Santa Maria delle Grazie*, which contains in its refectory the famous 'Cenacolo,' or 'Last Supper,' by Leonardo da Vinci; and that of San Carlo Borromeo (1847); of St Nazaro, which possesses several master-pieces of the best schools of Italian art; and of St Sebastiano, once a Roman temple.

Among the secular buildings of M., the most noteworthy is the magnificent Brera Palace, formerly a Jesuit college, and now used for public schools of the fine arts, with the official name of Palace of Arts and Sciences. Within its vast precincts, this unique institution includes an academy of art, a choice gallery of paintings, of the Bolognese and Lombard schools, a fine collection of casts for modelling purposes, a splendid public library, containing 140,000 volumes, and a rare collection of manuscripts, medals, and antiquities; it has also attached to it an observatory and a botanical garden. Besides the Ambrosian (q. v.), there are several large private libraries. Among the scientific and artistic institutions of M.

are the Museum of Natural History, the schools of surgery and medicine, especially that of veterinary practice, the celebrated Conservatory or school of music, and a military geographical institute, well known for the excellence of the maps it has issued. The educational establishments include four gymnasia, besides normal schools, technical schools, conventual schools, and a seminary. The charitable institutions are numerous and splendidly endowed, having an aggregate property of upwards of £7,000,000 sterling; the *Ospedale Maggiore*, or Great Hospital, founded by the ducal house of Sforza in 1456, accommodates 2000 patients, and annually admits upwards of 20,000. The Trivulzi Hospital, endowed by the Trivulzio family, maintains and clothes 600 aged pensioners. The Milanese places of amusement are on as grand a scale as the other public buildings of the city, the first in point of celebrity being the theatre of *La Scala*, which can accommodate 3600 spectators. The *Corso*, or chief street of M., is the universal fashionable promenade of the inhabitants; and the famous arcade, or *Galleria di Cristoforo*, with its brilliant shops and cafés, is also a favourite place of evening resort, and on account of its gay appearance has been called 'Little Paris.' M. carries on an immense inland trade in silk, grain, rice, and cheese, and has considerable manufactures of silk goods, ribbons, cutlery, and porcelain.

M. (Lat. *Mediolanum*) was originally a town or village of the Insubrian Gauls. It was conquered by the Romans 222 B.C., received the Latin franchise about 89 B.C., and the full Roman franchise 49 B.C. Under the Romans, it became a conspicuous centre of wealth and civic influence; its citizens were noted for their refined manners and literary tastes, and the public buildings for their beauty and elegance. In the beginning of the 4th c., it was selected as the residence of the imperial court by Maximian. M. was sacked by the Huns (under Attila) in 452, by the Goths (under the brother of Vitiges) in 539, and passed to the Longobards and Franks previous to its subjection by the German empire. After 961, it was long governed by dukes in the name of the emperors. The feuds of the Guelphs and Ghibellines distracted M., like all the other Italian cities. Supreme power became eventually vested in the Ghibelline Visconti, by whom the ascendancy of M. was extended over the whole of Lombardy. From 1545 to 1714, M. submitted to the successive predominance of France and Austria. Under Bonaparte, it was declared the capital of the Cisalpine Republic, of the Italian Republic, and, finally, of the Kingdom of Italy. In 1815, M. was restored to Austria, and continued the capital of the Austro-Italian kingdom until the annexation of Lombardy to Piedmont, in 1859, by the peace of Villafranca.

**MILAZZO** (anc. *Mylæ*), a fortified seaport on the north coast of the island of Sicily, 18 miles west of Messina. Pop. 10,000. Situation unhealthy. Chief exports, tunny, wine, silk, fruits, corn, oil, and liqueurs. The town is irregularly built, and is considered almost impregnable, owing to the great natural strength of its position and the extent of its military works and citadel. Garibaldi, with 2500 men, defeated 7000 Neapolitans here on the 20th of July 1860, and compelled the garrison to evacuate the fortress.

**MILDEW** (Ger. *Mehlthau*, meal-dew), a term of somewhat vague application to certain diseased states of plants caused or characterised by the growth of small parasitical fungi, and also to spots on cloth, paper, &c., and even on the surface of glass and other inorganic substances, produced by

# MILE—MILITARY ACADEMY.

the growth of minute fungi. The mildew fungi are numerous, and the name mildew is often given to many that are also known by other names, as BLIGHT, BRAND, BUNT, RUST, &c.; see these heads; see also BOTRYTIS and OIDIUM. Different species or families of plants have their own peculiar parasites; several kinds of parasitic fungus being, however, often known to infest one plant. Probably, the name mildew originally belonged to those moulds which form white mealy patches on leaves. Some of these belong to the genus *Erysiphe*, which exhibits fleshy somewhat gelatinous masses, becoming globose *sporangia*, filled with spore-containing *asci*, and surrounded by a fleshy *mycelium*, often spreading widely over the leaves and other parts of plants. Maples are sometimes covered with a mildew of this kind, so as to be quite hoary. Similar mildews are often seen on pease and other leguminous plants; also on umbelliferous plants. Sulphur has been found effectual in curing some of these mildews.—Many of the most destructive mildews are of a red or brown colour, as the mildew of the pear, *Acididium cancellatum*, that of the barberry, *Acididium Berberidis*, &c.; whilst some are almost black, as the corn mildew, *Puccinia graminis*, by which the crops are in some years greatly injured.

Whether mildew is the consequence of unfavourable weather and of fungi attacking an already weakened plant, or is the consequence of infection by spores of fungi brought through the air or soil to a plant previously healthy, is not yet well ascertained; and probably the one may be sometimes the case, and sometimes the other. There is no doubt that many kinds of mildew appear chiefly towards the close of summer on leaves in which vegetable life has already in a great measure lost its power.

MILE, the largest terrestrial measure of length in common use among the British and most continental nations, is derived from the Roman *milliare*, which contained 1000 paces (*mille passuum*) of 5 Roman feet each, the pace being the length of the step made by one foot. The Roman foot being between 11.65 and 11.62 English inches, the Roman mile was thus less than the present English mile by from 142 to 144 yards. The length of the modern mile in different countries exhibits a remarkable diversity, not satisfactorily accounted for. Before the time of Elizabeth, scientific writers made use of a mile of 5000 English feet, from the notion that this was the Roman mile, forgetting the difference in value between the English and Roman foot. The present statute mile was incidentally defined by an act passed in the 35th year of the reign of Elizabeth to be '8 furlongs of 40 perches of 16½ feet each'—i. e., 1760 yards of 3 feet each; and it has since retained this value. The *geographical* or *nautical* mile is the 60th part of a degree of the equator, and is employed by the mariners of all nations; but in Germany, the geographical mile denotes 1/30th part of a degree of the equator, or 4 nautical miles. The following table gives the length, in English statute miles, of the various miles that have been or are commonly used:

	Eng. Miles.
English geographical mile, . . . . .	= 1.153
German geographical mile, . . . . .	= 4.611
Tuscan mile, . . . . .	= 1.027
Ancient Scotch mile, . . . . .	= 1.127
Irish mile, . . . . .	= 1.273
German short mile, . . . . .	= 3.387
Prussian mile, . . . . .	= 4.680
Danish mile, . . . . .	= 4.684
Hungarian mile, . . . . .	= 5.178
Swiss mile, . . . . .	= 5.201
German long mile, . . . . .	= 5.753
Hanoverian mile, . . . . .	= 6.563
Swedish mile, . . . . .	= 6.648
The French kilomètre, . . . . .	= 0.621
and 29 kil. = 10 English statute miles nearly.	

MILETUS, anciently, the greatest and most flourishing city of Ionia, in Asia Minor. It was situated at the mouth of the Maeander, and was famous for its woollen manufactures, and for its extensive trade with the north. Before being forcibly colonised by the Ionians, it appears to have been inhabited by Carians. M. early founded a number of colonies on the Black Sea and in the Crimea, possessed a fleet, which sailed to every part of the Mediterranean, and even ventured into the Atlantic, and maintained long and expensive war with the Lydian kings. The 'Milesians' were believed to be the purest representatives of the Ionians in Asia. After the conquest of Lydia by the elder Cyrus, it was subdued with the whole of Ionia. It continued, however, to flourish till it was excited to rebellion against the Persians in the Ionian war, and was destroyed 494 B.C. It was rebuilt, but never reacquired its former importance. M. has an honourable place in the history of Greek literature, being the birthplace of the philosophers Thales, Anaximander, and Anaximenes, and of the historians Cadmus and Hecataeus.

MILFORD, a parliamentary borough (contributory to Pembroke) and seaport of South Wales, in the county of Pembroke, on the north shore of the Haven of the same name, 7 miles east-north-east of St Ann's Head. The Haven is said to be unequalled as a harbour by any other in the world. It is formed by an estuary running inland for 17 miles to Langwin (which is easily reached by vessels of 200 tons), and varying from 1 to 2 miles in breadth. It is protected from winds by a girdle of undulating hills, is deep (from 15 to 19 fathoms in most parts, while the spring-tides rise 25 feet), easy of access, and capable of anchoring the whole fleet of England in safety. Its distance, however, from the Channel, the highway of British commerce, is a serious disadvantage. The merits of the Haven have been recognised from the earliest times; but the rise of the town of M. may be said to have begun with the present century, when docks and quays, together with a mail packet-station for Ireland, a dockyard, ship-building slips, and an arsenal, were established here, only, however, to be removed in 1814. Since that time, with only occasional gleams of prosperity, M. has been in a declining condition; but the opening of the Milford Railway, and the construction of docks and wharfs, have given an impetus to its progress; though the trade of the place is little developed as compared with the capabilities of the haven and the mineral resources in the neighbourhood. In 1872, 937 vessels, of a burden of 192,392 tons, entered the port, and 1141, of 135,200 tons, cleared. Pop. (1871) 2836.

MILFORD, a village of Massachusetts, United States of America, 34 miles south-west of Boston, having 6 churches, a manufactory of machinery, and large boot and shoe manufactures. Pop. (1870) 950.

MILHAU, or MILLAU, a town of France, in the department of Aveyron, in a rich and fertile dale on the right bank of the Tarn, 55 miles north-west of Montpellier. During the 16th and 17th centuries, it was one of the strongholds of the Calvinists. Leather and gloves are manufactured, and there is a good trade in wool, timber, hides, cheese, and wine. Pop. (1872) 13,804.

MILITARY ACADEMY, ROYAL, an establishment at Woolwich, through which must pass all candidates for the Royal Artillery and Royal Engineers. The age for entrance is 17, and the vacancies are open to public competition. The pupils are denominated military cadets, and the parents or guardians have to make a considerable

## MILITARY ASYLUM—MILITARY ORDERS.

payment in regard to each, so long as they remain at the Academy; the annual charge for the son of a civilian being £120, that for the son of a naval or military officer less, according to the rank of the father. When the term of instruction—which comprises the subjects of a thorough general education, the higher mathematics, fortification, gunnery, and military duty—is completed, the cadets compete for the vacancies in the Engineers and Artillery, those who pass the best examination being allowed the refusal of the former corps. Those who obtain commissions in the Engineers proceed to Chatham for further instruction (with military pay, however) in their professional functions. The Artillery cadets at once join the Royal Artillery as lieutenants. The vote for the Royal Military Academy for the year 1874—1875 is £29,996, of which sum about three-fourths will be made up to the Exchequer by the payments for pupils and a contribution from the Indian government.

**MILITARY ASYLUM, ROYAL**, an educational government institution at Chelsea, near, but wholly distinct from, the Royal Hospital for Pensioned Soldiers. Its object is the suitable education for trade, &c., of 500 male children—generally orphans—of British soldiers. For these, there are a model school and an infant school, and the boys have a completely military organisation, with scarlet uniform, band, &c. As a result of their training, a large proportion of the pupils ultimately volunteer into the army. The school was originally established in 1803 by the late Duke of York, whence it is still commonly known as the 'Duke of York's School.' Originally a similar school for soldiers' daughters was included, but was not found to answer, and has been discontinued. Attached to the school is a training establishment for military schoolmasters, known as the Normal School. The total cost of the whole institution is about £11,500 per annum.

**MILITARY FRONTIER** (Ger. *Militärgrenze*), a border crown-land of the Austrian empire, is bounded on the N. by Croatia, Slavonia, and the Wojwodschaff; on the E. by Hungary; on the S. by Turkey and Dalmatia; and on the W. by the Adriatic. Area, 7840 square miles; civil population, 696,000. Till June 1872, the M. F. included, as its eastern portion, the frontier between the Banat and Servia. At that date, however, this portion was incorporated with the lands of the Hungarian crown; and the M. F. is now officially known as the Croato-Slavonic Military Frontier. The breadth of the crown-land, which is considerable at the western extremity, diminishes to only a few miles at the eastern. The surface has an average elevation of upwards of 2000 feet; and the western coast, for the distance of 74 miles, is occupied by sharp naked rocks. Towards the east, the land declines, and all the important rivers—of which the Unna and the Save are the chief—flow eastward. The climate is severe in the highlands in the west, but mild in the lower districts towards Slavonia. Maize, wheat, oats, fruits, and vegetables are the principal productions. Cattle-rearing is not pursued to any great extent.

The M. F. owes its origin as a crown-land to the necessity of having a permanent body of defenders on the borders during former wars, and especially during wars with the Turks. In the 15th c., the Austrians had gained from the Turks certain tracts of territory on the banks of the Save and Danube. These tracts they colonised, making it, however, a condition that the colonists must render military service against the Turks. Thus originated the Capitanate of Zeugg, during the reign of Mathias

Corvinus. The Warasdin Frontier originated in the same manner under Ferdinand I. In the 17th c., the Petrinier Frontier, which at a later period received the name of the Banat Frontier, was erected. The military stations along the frontier serve a threefold purpose—the defence of the country, the prevention of smuggling, and the prevention of the spread of contagious disease into the territories of the Austrian empire. The inhabitants of this crown-land enjoy peculiar privileges. Their immigrant ancestors received only the temporary use of lands consigned to them; but in 1850, a law was passed making over the land to the occupiers as their own property. This right of property does not belong, however, to individuals, but to the family in a united sense. The oldest member of a family (called the *Hausvater*) is intrusted with the management of the land; his partner (the *Hausmutter*) ranks equal with him, and they each receive a double share of the profits for the year, as recompense for the management of the estate. A family of this sort is called a Border-house (*Grenzhaus*). All who are able to bear arms are sworn to the service from their 20th year. The soldier of the frontier, who is clothed as well as armed and supplied with ammunition by government, finds it his duty not only to watch and protect the frontier, but to preserve peace and order in the interior, and to go on foreign service when required. Only the smaller portion of the forces of the M. F. is retained in readiness for active service, while the remainder pursue their ordinary employments. To facilitate the accomplishment of the purposes aimed at by the M. F., the *cordon*, a series of guard-houses along the whole frontier, affording accommodation to from four to eight men, as well as larger ones, accommodating twelve men and a junior officer, has been instituted. Within this line are the officers' posts. Without announcing himself at the posts, no one is allowed to pass the boundary; and after permission is given, the passenger must remain a longer or shorter time at the quarantine establishment, in order that all introduction of disease may be prevented.

**MILITARY ORDERS**, religious associations which arose from a mixture of the religious enthusiasm and the chivalrous love of arms which almost equally formed the characteristics of medieval society. The first origin of such associations may be traced to the necessities of the Christian residents of the Holy Land, in which the monks, whose first duty had been to serve the pilgrims in the hospital at Jerusalem, were compelled, by the necessity of self-defence, to assume the character of soldiers as well as of monks. See JOHN (St), KNIGHTS OF. The order of the Templars (q.v.) was of similar origin. Those of Alcantara and Calatrava in Spain had for their immediate object the defence of their country against the Moors. These orders, as well as that of Avis in Portugal, which was instituted with a similar view, followed the Cistercian rule, and all three differed from the Templars and the Knights of St John in being permitted by their institute to marry once. The same privilege was enjoyed in the Savoyard order of Knights of St Maurice and the Flemish order of St Hubert. On the contrary, the Teutonic Knights, who had their origin in the Crusades (see GRAND MASTER), were bound by an absolute vow of chastity. With the varying conditions of society, these religious associations have at various times been abolished or fallen into disuse; but most of them still subsist in the form of orders of knighthood, and in some of them, attempts have recently been made to revive, with certain modifications, the monastic character which they originally possessed.

## MILITARY SCHOOLS—MILITARY TRAIN.

**MILITARY SCHOOLS**—as regards the French army, are divided into several classes: 1. Those for the education of officers already in the service; of these, there are the Staff College (p. 10), and the establishment at Gisors for training Engineer officers. 2. Professional schools common to officers and men with a fixed rank: Gunner, School of Artillery, School of Engineers, &c. 3. Schools for the professional education of candidates for commissions; in these, reference should be made to *Artillery School*, *Infantry*, and to *Scientific Military School*. 4. The schools for men in the ranks and for their children as described under *Schools*, *Recruits*, &c.; while the instruction provided for their sons or nephews is shown under *Military Schools*, *Boys*.

The Military Schools of Europe receive considerable attention, especially those of France, where a military commission is one of the best educational prizes looked forward to. In France no attempt is made to impart general education at the military academies; a boy is required to have a thorough general knowledge before he can be admitted to these institutions. Being open to universal competition, and being the only channel—or nearly so—for the best employment under the state, the great military schools, by the high standard required for them, give great impetus to general education throughout the empire, and the Lycees, or public schools, select their course of instruction in the anticipated competition. In the army, two-thirds of the line commissions, and one-third of those for the scientific corps, are given to non-commissioned officers, but very few of these rise beyond the rank of captain; the remaining commissions in the line and scientific corps, and all appointments to the staff, are given by competition, after a careful course of professional education. The candidates in open competition are placed according to merit either in the Infantry School of St Omer, or the celebrated Polytechnique; at both colleges, they have the right, if they need it, to partial or entire state support. From the School of St Omer, the more promising pupils pass to the Staff School, and thence, after a thorough course, to the First Major of the army; the remaining students pass as subalterns into the line. The pupils of the Polytechnique, which is entered after the age of 17 years, have annually about 150 valuable prizes open to them. The first 30 to 40 candidates usually select civil employment under the state, such as the 'Ponts et Chaussées'; those next in merit choose the Artillery and Engineers, and pass through a technical course at the School of Application. The remaining students either fail to qualify, and leave the school, or have to content themselves with commissions in the line, subordinate situations in the government, civil or colonial service, or they retire into civil life altogether.

In actual service, there are schools for the men, who are also taught trades and singing. The standard of education among French soldiers is far higher than among their English brethren, as the *conscription* draws the men from all classes of society.

The Prussian system of military education differs from that of France in that competition is but sparingly resorted to; and the object is to give a good general and professional education to all the officers, rather than a specially excellent training to a selected few. Aspirants for commissions must enter in the ranks, and within six months pass a good examination in general and liberal knowledge; if, however, the candidate has been educated in a cadet-house—which is a semi-military school for

youth—and has passed properly out of it, this examination is dispensed with. After some further service, the aspirant goes for nine months to one of three 'Division Schools,' where he completes his professional education. If he pass the standard here required, he is eligible for the next vacancy, but cannot be commissioned, unless the officers of the corps are willing to accept him as a comrade. The Artillery and Engineer schools do for those services what the Division Schools do for the line. The culmination of Prussian military education is the Staff School, open to competition for all the officers of the army, and presenting the highest prize in the profession. In all the schools, the candidate studies at the expense of the state, or receive grant auxiliary grants.

The Austrian system is very elaborate, and commences at an early age—boys intended for military service beginning their professional, almost contemporaneously with their general education. There are schools for training for non-commissioned officers and for officers; and senior departments for imparting more extended instruction to both classes. Candidates for appointment as non-commissioned officers pass by competition through the lower houses, where they remain till 11 years old; the upper houses, which detain them till 15; and the school companies, whence, after actual apprenticeship to service, a few pupils pass to the academies for aspirants for commissions, and the others are draughted into the service as non-commissioned officers. For officers, boys are pledged to the service by their parents at the age of 11, when they are placed in cadet-schools; after which, the state takes charge of them. At about 16, the boys pass, according to qualification, to the line or scientific corps academies; and four years later, into their services themselves. The young officer's chance of entering the Staff School—and therefore the staff—depends upon his place at the final academic examination. The competition observed throughout the course of military education is said to impart great vigour to the nation.

In the Italian army, the system as nearly approaches that of France, that a separate description is unnecessary. It need only be stated that the educational status of the Italian officer is considered high.

**MILITARY SECRETARY**, an officer on the personal staff of generals in high command. His duties are to conduct the correspondence of his chief, and to transact a great amount of confidential business, which would dangerously occupy the time of the general himself. The military secretary to the officer commanding-in-chief at the War Office receives £1800 per annum, and is usually a general officer. To a commander-in-chief in the field, he is for the most part below that rank, and receives only the staff pay of £346, 15s.; while to a general commanding a division only, an *Assistant Military Secretary*, at £173, 7s. 6d. per annum, is allowed. This staff pay is of course additional to the officer's regimental or unattached pay.

**MILITARY TRAIN**, formerly a highly important corps of the army, of which the function was to transport the provisions, ammunition, and all other materiel, together with the wounded in time of battle. It was formed after the Crimean war, on the dissolution of the Land-Transport Corps (p. 10). It comprised six battalions, in all 1840 officers and men; and its annual cost for pay, &c., was about £71,000. The corps ranked after the Royal Engineers, and was classed as Mounted Infantry, the officers receiving infantry rates, and the men cavalry rates of pay. The commissions were per-

## MILITELLO—MILITIA.

is in the line. The men were armed with sword, but rather for defensive than offensive purposes. Attached to each battalion were horses, with proportionate wagons and carriages.

It is proper to observe that the Military Train was only the nucleus of a transport service for the army, and that in time of war it would be strengthened by the addition of thousands of horses and the incorporation of many hundred men. The advantage of possessing even a small body trained, and capable of directing the operations of others, was amply demonstrated by the success of the Crimea in 1854—1856; so that it is not ungrudgingly the expense of this small body in time of peace it was comparatively small. The Military Train was dissolved in 1870, as being too military in its formation; its functions were transferred to the Transport of the Army Service Corps, a purely administrative organisation.

MILITELLO, a city of Sicily, in the province of Agrigento, 21 miles south-west of the town of that name, pop. 8000. It stands on a mountain in a healthy situation. In its vicinity there are salt lagoons.

MILITIA (Lat. *miles*, a soldier) has now the meaning of the domestic force for the defence of a nation, as distinguished from the regular army, which can be employed at home or abroad for either aggressive or defensive operations. The militia has a reserve, under its law military, and its defence would fall, on the discomfiture of the regular army; but the system differs from that of other countries, and with the exception perhaps of the United States during peace, none are formed on the model of the British militia.

The militia is a constitutional force raised under the authority of parliament, in which the people—in the last resort—wage their own bodies for the defence of their own soil, and in which they depute their representatives to command and to the sovereign crown nominees. Organised by counties, it is essentially a local force: the selection of candidates for first commissions by the county committee connects it with the local interests of the county, and the command of the sovereign effectually connects it with the interests of the three estates. In the Anglo-Saxons, all men were required to serve as a sort of body-rent for the land they held; no special organisation being adopted, as rarely attained in the use of arms. The system found to its cost when the Danes invaded during Alfred's reign. That great king, to meet a similar occurrence, established the militia on the basis of land, the basis of numbers, but the want of discipline: so many families holding ten tythings a hundred, and humiliated into county powers, each under its lord, or duke. Each section of the county was not only to furnish its quota in time of war, but to provide arms, keep them in repair, and undergo so many days' training every year. The system subsisted in more or less vigour until the conquest; then the feudal troops at first made the militia unnecessary; but it never failed to exist. When the crown began to quarrel with the Norman barons, it naturally became the most powerful instrument in reviving the militia, and the English yeomanry became the crown's main reliance against the enemies, and a forerunner of the gradual enfranchisement of the commons. Henry II. established 'an assize of arms,' whereby every holder of land was bound to produce a certain number of men fully equipped, and capable of

fighting in the national defence. The arms were annually inspected, and it was illegal to sell, lend, or pawn them. This annual assembly of the fyrd or militia is first recorded after the Conquest in 1181; by the statute of Winchester in 1285, Edward I. revised the scale of arms for the several ranks. Further alterations to suit the advances in the art of war took place in 1558 (4 and 5 Ph. and M. c. 2). In 1604, James I. (1 Jac. c. 25) abolished the fyrd, and substituted 'Trained' (commonly called 'Train') Bands, to the number of 160,000 men—a force partaking of the nature of militia and volunteers, but deficient in discipline and drill. During the civil war of Charles I., the train bands or militia mostly sided readily with the parliament. Up to this time, the command had never by any law been definitely assigned to the crown or to any other body. After the Restoration, the loyal parliament of Charles II. immediately reorganised the militia—essentially on its present footing—and declared as law that 'the sole supreme government, command, and disposition of the militia is, and by the laws of England ever was, the undoubted right of his majesty and his royal predecessors.' As, however, the crown from this time began to depend for its support upon a mercenary army, and as the local status of the militia officers must always render the militia a force dependent on parliamentary influence and ties, the militia was much neglected until 1757, when a large portion of the regular army being absent in the Seven Years' War, it was carefully organised for the defence of the kingdom. Several militia acts have been subsequently passed, but rather with a view to consolidating the militia laws of England, Scotland, and Ireland, and to effect minor changes necessary for the growth of the institution, than to remodel in any essential degree the constitution of the force. The acts under which the militia is now organised are the 42 Geo. III. c. 90 and 91; 49 Geo. III. c. 120; 15 and 16 Vict. c. 50; 17 and 18 Vict. c. 13, 105 and 106; and 18 and 19 Vict. c. 57, 100, and 106. The present law stands thus: The sovereign appoints lords lieutenant of counties, who nominate to first commissions in their county regiments. The general commanding in the military district commands the militia force through the colonels of the sub-districts in which the regiments respectively are.

The force to be provided by each county—known as its 'quota'—is fixed by government in proportion to the population, &c. The numbers must be provided in some way. In practice, they are raised by voluntary recruitment; but should volunteering fail, a levy by ballot would be made upon all the inhabitants of the locality between the ages of 18 and 35. The power of making this ballot always exists, and would have by law to be enforced, but for the Militia Ballot Suspension Act, which, when the measure is unnecessary, is passed from year to year. Many classes are exempt from the ballot, as peers, soldiers, volunteers, yeomanry, resident members of universities, clergymen, parish schoolmasters, articled clerks, apprentices, seafaring men, crown employés, free watermen of the Thames; in England, any poor man with more than one child born in wedlock; in Scotland, any man with more than two lawful children, and not possessed of property to the value of £50; in Ireland, any poor man not worth £10, or who does not pay £5 per annum for rent, and has more than three lawful children under the age of 14.

The militia are bound, when called upon by the crown, to assemble annually for any period not exceeding three months, for training purposes; and the government can embody the whole, or part of

# MILITIA—MILK.

the force, at any national crisis. The regiments were embodied almost without exception during the Russian war of 1854—1856, and to a considerable extent at the time of the Indian mutiny, 1857—1859. The quota of the United Kingdom is 200,000 men, but not above two-thirds of that number can be considered as effective. They may not be sent out of the kingdom, except they volunteer, and then only by special permission of parliament. As a defensive or garrison force, setting free the regular army for aggressive operations, the militia is a most valuable institution; and in times of war, it has ever been found an admirable training-school whence soldiers volunteer into the permanent forces.

A militia volunteer receives bounty, payable partly on joining, and partly in instalments after each training period. When out for training, or embodied for permanent duty, the officers and men receive the same pay as regular troops of corresponding arms of the service, and are under the Mutiny Act and Articles of War, except that no punishment can extend to life or limb. The officers rank with, but junior to, their brethren of the regular army; the great distinction in appearance between regular and militia troops being, that in the former the appointments are all of gold-lace, and in the latter, of silver; the buttons being similarly distinguished. The force is divided into Heavy, Light, Rifles, and Highland Infantry, and into Artillery, the latter being generally limited to coast counties, and being very highly esteemed by the authorities.

The celebrated Local Militia was instituted in England and Scotland in 1808, and suspended in 1816. It consisted of a force for each county six times as numerous as the proper militia quota, comprising, of course, many classes, which, from age or other circumstances, were ineligible for the militia. These troops could only be marched beyond their respective counties in the event of actual invasion. Their numbers reached, in 1811, to 213,000 men.

The present annual cost of the militia (1873—1874) amounts to £1,227,443 for effective services, and £16,548 for non-effective services. As a constitutional precaution, the estimates were formerly prepared—at least nominally—by a committee of the House of Commons; but as the check was of no real advantage, it was abolished by a resolution of the House in 1863, and thenceforward the Minister of War includes the charge among the many services provided for in his department.

MILK is an opaque white fluid secreted by the mammary glands of the females of the class *Mammalia*, after they have brought forth their young, and during the period in which their offspring are too immature to live upon ordinary food. It is devoid of odour, except for a short time after its extraction; is of a slightly sweet taste, most commonly of a slightly alkaline reaction (except in the *Carnivora*, in which it is acid); and its average specific gravity (in the case of human milk) is 1032.

When milk has been allowed to stand for some time, a thick, fatty, yellowish-white stratum (the cream) forms upon its surface. When this is removed, the fluid below (popularly known as 'skim-milk') is found to be of greater specific gravity, and of a more bluish-white tint. Milk does not coagulate on boiling, but a membrane or film of coagulated caseine, containing fat corpuscles, forms upon its surface. If milk be allowed to stand for some days exposed to air at the ordinary temperature, it gradually begins to exhibit an

increasing acid reaction, from the formation of lactic acid from the milk-sugar; while the caseine becoming coagulated by the action of the lactic acid, is separated in the form of 'curds,' and the fluid gradually assumes the form of a thickish pulp. The ordinary means of obtaining the caseine (which exists in solution in the milk) in the form of curds is by the addition of a piece of rennet (the dried stomach of the calf), which acts as powerfully as any acid. The curds thus separated form the basis of cheese, while the fluid portion left after their removal is known as the 'whey.'

When examined under the microscope, the milk appears as a clear fluid, containing fat globules (the milk globules, as they are usually called) in suspension. They commonly vary from '0012 to '0018 of a line in diameter. They are each invested with a delicate coat of caseine, which prevents their running together. By *churning*, the surrounding envelopes become ruptured, and the contents are made to unite, forming *butter*. In addition to milk globules, colostrum globules (see *COLOSTRUM*), which are irregular conglomerations of very small fat globules, occur in the milk for the first three or four days after delivery.

The following table, which is based on the researches of Vernois and Becquerel, represents the density and composition of 1000 parts of milk in various animals:

	Density.	Water.	Solid Constituents.	Caseine and Extractive Matters.	Sugar.	Fat (Butter).	Salts.
Woman,	1032.67	889.08	110.92	39.24	43.64	59.06	1.38
Cow,	1033.33	864.06	135.94	55.19	38.03	36.12	1.65
Mare,	1033.74	904.30	95.70	33.35	32.76	24.36	1.83
Ass,	1034.57	890.12	109.88	35.65	20.46	18.23	2.05
Goat,	1033.53	844.99	155.10	35.14	36.91	36.87	1.11
Ewe,	1040.98	832.32	167.68	69.78	39.43	31.21	7.11
Bitch,	1041.62	772.08	227.92	116.88	15.29	27.95	7.08

The actual caseine which in the preceding analyses is associated with the undefined group of substances termed *extractive matters*, ranges from 27 to 35 in 1000 parts of healthy human milk, while in the colostrum it amounts to 40; in the milk of the cow it is somewhat higher; while in that of the bitch, and probably of all carnivorous animals, it is more than trebled. It is found in the case of women that the quantity of the caseine increases with the free use of animal food, and diminishes upon vegetable diet.

The fatty matters range from 25 to 43 in 1000 parts of women's milk, while in cows' milk they average, according to Lehmann, 45; and in bitches' milk, rise to 110. These fatty matters, which collectively form butter, consist of an admixture of 68 per cent. of margarine, 30 per cent. of oleine, and 2 per cent. of an admixture of fats, which, on saponification, yield butyric, caproic, caprylic, and capric acids. The milk which is last yielded is much richer in fat than that which is first drawn.

The sugar, or lactine, whose properties are described in the article *SUGAR OF MILK*, varies in human milk from 32 to 62 in 1000 parts, and in cows' milk from 34 to 43. The milk of bitches, when fed on a purely animal diet, often contains no traces of sugar; but if they are fed on vegetable or mixed food, a considerable quantity of sugar is found. The salts in women's milk range from 0.6 to 2.5 in 1000 parts, and in cows' milk from 3.5 to 8.5. That a peculiar selective power is exerted by the mammary gland, is shown by the following table, which shows the comparative analyses of

# MILK-FEVER—MILL.

the ashes of cows' milk and of cows' blood, each reckoned for 100 parts:

	Ash of Milk.	Ash of Blood.
Chloride of potassium,	14.78	30.00
Chloride of sodium,	4.74	39.82
Potash,	33.46	11.44
Soda,	6.96	29.09
Phosphoric acid,	36.40	7.74
Lime,	17.34	1.30
Magnesia,	2.20	0.75

by the potassium and sodium compounds stand in this inverse relation to one another in these two fluids, is not accurately known. The abundant supply of phosphoric acid, lime, and magnesia in the milk, is doubtless for the purpose of building up the infant skeleton.

The milk is liable to tolerably regular changes in different periods of lactation; for example, the sugar is deficient during the first month, and is in excess from the eighth to the tenth month; the casein is in excess during the first two months, and most deficient between the tenth and eleventh month; the butter is considerably in excess during the first month, and slightly so for the next two months; while the salts are most abundant during the first month, but present no regular law of increase. Hence, it will readily be seen that in the selection of a wet-nurse, one of the leading requirements should be, that her milk should be of the same age as that of the mother's. Various medicines, as, for example, iodide of potassium, iodide of mercury, and quinine, have been detected in the milk, after being taken by the mother; and many cases are on record in which strong mental impressions, as fear or anger, acting on the mother, have so far poisoned the milk as to cause immediate convulsions in the infant.

The daily quantity of milk is dependent upon various conditions, such as bodily constitution, food, &c. Lampérierre determined the quantity of milk secreted in definite times by a large number of women, and found as a mean for each breast between fifty and sixty grammes (the gramme being  $\frac{1}{16}$  grains) in the course of two hours, assuming that the secretion continues at a uniform rate.

In those cases in which a wet-nurse cannot be obtained, it is expedient to modify cows' milk, so as to make it resemble that of women. The main differences are, that the former contains more casein, and less sugar and water than the latter. By exposing cows' milk to a gentle heat in a wide open vessel, we obtain a film of casein which may be removed (more than once, if necessary); on then adding sugar (sugar of milk, if procurable) and water, we obtain a good imitation of the human secretion.

In the article on DIGESTION, the uses of the various ingredients of the milk in relation to nutrition are sufficiently noticed. The milk of cows is extensively used as an article of diet both for healthy persons and invalids, and it enters largely into all hospital, prison, and workhouse dietaries. In patients with a tendency to consumption, or in whom that disease has already manifested itself in its early form, cream is often of great service, especially when the stomach cannot bear cod-liver oil.

The adulterations to which milk is often subjected are noticed in the article FOOD, and the instruments used for testing the purity of this fluid are briefly referred to in the article GALACTOMETER. Water is by far the commonest adulteration, and if it has been added in large quantity, the fraud may be detected by evaporating a small weighed quantity of the milk (say 500 grains) to dryness, and ascertaining whether the due proportion of solid constituents is left.

Various methods have been proposed for the preservation of milk for sea-voyages, &c. Moore's Essence of Milk is prepared by the addition of a little sugar and the evaporation of the fluid, at a temperature of 110°, to one-fourth of its bulk, when it is put in small tin-cases, soldered down, steeped in boiling-water for a time, and taken out to cool. This preparation keeps good for a long time. Blatchford's Solidified Milk is prepared by mixing 112 lbs. of milk with 28 lbs. of white sugar and a little bicarbonate of soda. The mixture is evaporated under certain conditions, till it assumes the form of a creamy powder, which is cooled, weighed into parcels of 1 lb. each, and compressed into brick-shaped masses, which must be triturated and mixed with warm water when required for use. Grimwade's Desiccated Milk is prepared by mixing the fluid with a little sugar and alkali, and evaporating it till it is as thick as dough; it is then dried, crushed, and bottled. At the meeting of the British Association in 1859, the Abbé Moigno described four methods employed in France for the preservation of milk, of which the most valuable seemed those of Maber and De Pierre. For details regarding these methods, we must refer to the abbé's paper. He found milk prepared by Maber's process perfectly good after having been kept between five and six years. The milk prepared by De Pierre's process, unlike the other preparation, is liquid. A specimen of it, the age of which was not stated, which the abbé brought to Aberdeen, was pronounced by Professor Christison to be perfectly fresh and sweet.

**MILK-FEVER**, in the lower animals, comes on within a few days after parturition. One variety, common to most animals, consists in inflammation of the membranes of the womb and bowels, and is produced by exposure to cold, overdriving, or injury during labour; it is best treated by oil and laudanum, tincture of aconite, and hot fomentations to the belly. The other variety, almost peculiar to the cow, attacks animals in high condition, that are good milkers, and have already borne several calves; it consists in congestion and inflammation of the brain and large nervous centres, and impairs all the vital functions, leading to dulness, loss of sensation and motion, and stupor. Blood must be drawn early, whilst the cow is still standing and sensible. Later, it only hastens death. A large dose of physic, such as a pound each of salts and treacle, a drachm of calomel, an ounce of gamboge, and two ounces of ginger, should at once be given, solid food withheld, clysters of soap, salt, and water thrown up every hour, cloths wrung out of boiling water applied along the spine, the teats drawn several times daily, and the animal frequently turned. Although treatment is uncertain, prevention is easily insured by milking the cow regularly for ten days before calving, feeding sparingly on laxative unstimulating food, giving several doses of physic before, and one immediately after calving; and when the animal is in very high condition, and prone to milk-fever, bleeding her a day or two before calving.

**MILKWORT.** See *POLYGALA*.

**MILL.** This word is now used in a general way as a name for almost all kinds of manufactories, as well as for grinding machinery; but we shall only describe here the arrangements of an ordinary flour-mill, adding a brief notice of the edge-mill in use for grinding oil-seeds and some other substances.

From time immemorial, corn has been ground by a pair of stones. The earliest and rudest handmills

were no doubt somewhat like that shewn in fig. 1, which is a representation of one sent home by Dr Livingstone, the African traveller, from the banks

Fig. 1.—African Handmill.

of the Shire, in South Africa. He describes it as 'a mill such as Sarah used, when told by her lord to do the thing handsomely and in a hurry for the strangers—i. e., a big stone worn hollow operations of grinding. The upper stone is grasped by both hands, and the weight of the body brought down on it as it is shoved to the lower part. . . . The meal is made very fine.' The next step in advance of this was the quern or handmill, still in use in the Shetland Isles, the Faröes, and other places. The old quern scarcely differs from a pair of modern millstones, except in the stones being small enough to allow of the upper one being turned by the hand, instead of by wind, water or steam power.

The millstones which are now all but universally used for grinding corn are made from buhr-stone, a form of silica like flint in hardness, but not so brittle. This rock is only found in abundance in the mineral basin of Paris and some adjoining districts, and belongs to the Tertiary formation. It is of a cellular texture, and is frequently full of silicified shells and other fossils. Millstones are usually from four to six feet in diameter, and are each made up of a number of pieces strongly cemented and bound together with iron hoops. One six feet in diameter, of fine quality, will cost about £50. The grinding surface of each stone is furrowed or grooved in the manner shewn in fig. 2, the grooves being cut perpendicularly on the one side, and with a slope on the other. A pair of stones

Fig. 2.—Millstone, shewing Grinding Surface.

are used together, and both being furrowed exactly alike, the sharp edges of the grooves on the one come against those on the other, and so cut the grain to pieces.

Fig. 3 shews a section of a flour-mill reduced to its simplest elements. The millstones are at *a*, the lower of which is firmly fixed, it being a matter of importance to have this done securely; and the upper is made to revolve, on a shaft which passes up

through the lower one, at a speed of one hundred revolutions per minute more or less. Motion is communicated by the spur-wheel *b*, which is driven by a water-wheel or other power. The grain, previously cleaned, is supplied to the millstones means of the hopper *c*, connected with which is a valve, *d*, for regulating the supply. Pass through a hole in the centre of the upper stone, it comes in between the two, where it is ground, and thrown out on all sides by means of the centrifugal force. The millstones are, of course, enclosed, and the flour passes down through spout *e*, to the worm at *f*, which, while it elevates the ground corn, carries it along to elevators. These raise it up to the floor, on which the dressing machine, *h*, is placed. This is a cylinder which was formerly made of wirecloth of various degrees of fineness, and consequently separates the flour into different qualities—the finest passing through the first portion, the second

Fig. 3.—Elementary Section of a Flour-mill.

through the next, and so on; but no part of it is enough in the openings to let through the which passed out at the end. Silk is now put to wirecloth for dressing the flour. Hopper, placed below the dressing-machine, by means of which the flour and bran are filled into sacks. 1 being fine flour; No. 2, seconds; and No. 3, thirds.

One of the largest flour-mills in Great Britain is the one belonging to Messrs Tod at Leith, about 150 feet long, 50 feet broad, and 65 feet high. At one end of it is placed a steam-engine of 100 horse-power, which works all the machinery of the mill. This communicates motion to a series of shafts and wheels occupying the ground-floor, being used as much as possible for driving wheels instead of spur-gear, so as to avoid a violent motion. On the second floor are placed 36 pairs of millstones, arranged in two lines along the length of the mill. The wheat being supplied silently to them by trifugal feeders. On the third floor are situated hoppers for feeding the millstones. The fourth floor contains iron rollers for partially crushing wheat before being supplied to the millstones. This floor also contains silk and wire dressing machines. On the fifth floor are placed the silk dressing-machine, and also smut-machine cleaning the wheat previous to grinding, which is somewhat similar to thrashing-machines. The sixth and highest floor also contains smut-machines. These machines are connected in the most convenient manner by means of elevators ascending through

the floors; and along each, where necessary, there runs, in a horizontal direction, an Archimedean screw, so that the grain or the flour can be conveyed to any of the machines without the assistance of hand-labour.

This mill converts wheat into flour at the rate of about 500 sacks a day of 24 hours—a quantity nearly sufficient to supply bread for the entire population of a city like Edinburgh. [The above description applies to Messrs Todds' mill as it stood in 1863; since then it had been greatly extended, but unfortunately it was totally destroyed by a fire in January 1874.] The great government mill of St Maur is the most remarkable mill in France.

There is a form of mill in use for some purposes where the millstones are vertical, as shewn in fig. 4, and called the edge-stone mill. It is sometimes, though rarely, used for grinding corn; but is much employed for crushing oil-seeds and for grinding dye-stuffs, sugar, chemicals, and a multitude of other substances. The stones are generally of some hard rock, such as granite or sandstone, and from 5 to 7 feet in diameter. For such purposes as grinding clay or loam, they are usually made of cast iron, and of a smaller size. The stones revolve in opposite

Fig. 4.—Edge-stone Mill.

directions, sometimes upon a fixed stone or metal bed, and at other times it is the bed-plate itself which revolves, and in so doing turns the edge stones which rest upon it.

Among the recent improvements in our flour-mills which have attracted considerable attention are: 1. The patent process of dressing the grinding surface of the millstones by means of a peculiar kind of diamond, which rapidly covers it with fine grooves. This is still, however, more largely, and perhaps more efficiently, done by the slower process with the niding hammer; 2. The keeping down of the temperature of the millstones by means of a current of cold air; and, 3. The introduction of Carr's Patent Disintegrator, which grinds wheat and other substances by means of two vertical iron discs about five feet in diameter, and a few inches apart, in each of which are several concentric rows of steel pegs, so arranged that those on the one disc overlap without touching those on the other. The discs are made to revolve rapidly in opposite directions, so as to grind the wheat by percussion.

**MILL, in Law.** The owner of a mill situated on the bank of a stream is entitled to have the use of the stream undiminished in volume; and if the other riparian owners above interfere with the stream by diminishing its volume, thereby causing injury to the mill, the mill-owner has a right of action against the party so acting.

**MILL, JAMES,** was the son of a small farmer, and was born in the neighbourhood of Montrose, Scotland, 6th April 1773. He studied, with a view to the church, at the university of Edinburgh, where he distinguished himself in Greek and in Moral and Metaphysical Philosophy. He was licensed to preach in 1798; but instead of following out the ministry, he went to London in 1800, where he settled as a literary

man. He became editor of the *Literary Journal*, which after a time was discontinued; and wrote for various periodicals, including the *Eclectic* and the *Edinburgh Review*. In 1806, he commenced his *History of British India*, which he carried on along with other literary work, and published in the winter of 1817—1818. The impression produced by this masterly history on the Indian authorities was such, that, in 1819, the Court of Directors of the Company appointed him to the high post of Assistant-examiner of Indian Correspondence, notwithstanding the then unpopularity of his well-known radical opinions. The business assigned to his care was the Revenue department, which he continued to superintend till four years before his death, when he was appointed head of the Examiner's office, where he had the control of all the departments of Indian administration—political, judicial, and financial—managed by the Secret Committee of the Court of Directors. Shortly after his appointment to the India House, he contributed the articles on Government, Education, Jurisprudence, Law of Nations, Liberty of the Press, Colonies, and Prison Discipline to the *Encyclopædia Britannica*. These essays were reprinted in a separate form, and became widely known. The powers of analysis, of clear statement, and of the thorough-going application of principles, exhibited in these articles, had probably never before been brought to bear on that class of subjects. In 1821—1822, he published his *Elements of Political Economy*, a work prepared primarily with a view to the education of his eldest son, John Stuart Mill. In 1829, his *Analysis of the Human Mind* appeared. His last published book was the *Fragment on Mackintosh*, brought out in 1835. He was also a contributor to the *Westminster Review* and to the *London Review*, which, after a few numbers, was merged in the *London and Westminster*.

Not long after he settled in London, he made the acquaintance of Jeremy Bentham, and for a number of years he and his family lived during the summer in Bentham's country-house. Although he must have derived much benefit from his intercourse with the great law-reformer, he was not a mere disciple of Bentham, but a man of profound and original thought, as well as of great reading, in all the departments of moral, mental, and political philosophy. His conversation was impressive to a remarkable degree, and he gave a powerful intellectual stimulus to a number of young men, some of whom (including his own son, and Mr Grote, the historian of Greece) have since risen to eminence. He took a leading part in the founding of University College, London. He died at Kensington, 23d June 1836.

**MILL, JOHN STUART,** son of the preceding, was born in London on the 20th of May 1806. He was educated at home by his father. In 1820, he went to France, where he lived for upwards of a year, making himself master of the French language, and occasionally attending public lectures on science. He lived for some time at Paris, in the house of the French economist, Jean Baptiste Say, where he made the acquaintance of many men distinguished then, or afterwards, in letters and in politics. He spent part of his time in the south of France, in the house of Sir Samuel Bentham, brother to Jeremy Bentham. During this stay in France, he laid the foundation of his great familiarity with, and interest in, the politics as well as the literature of the French nation. In 1823, he entered the India House, and became a clerk in the Examiner's office, where his father was Assistant-examiner. For thirty-three years he continued to be occupied in the department of the office named the Political, or the transactions

of the Company with the native states. In 1831, he was appointed Assistant-examiner, and in 1856 he was placed at the head of the department. He energetically opposed the transfer of the India government to the crown in 1858. On the score of failing health he declined a seat at the new Indian Council, and retired from office in October of the same year, on a compensating allowance. At the general election of 1865, M. was returned to parliament for Westminster; and till he lost his seat at the election of 1868, he acted with the Advanced Liberals. His death took place on May 8, 1873, at Avignon, where he had spent most part of the last years of his life.

Mr Mill became an author at a very early age, and may be looked upon as one of the foremost thinkers of his time. His first publications consisted of articles in the *Westminster Review*. He took an active part in the political discussions that followed the revolution of 1830 in France, and the Reform-Bill movement in England; and from 1835 to 1840 was editor, and along with Sir W. Molesworth, proprietor of the *London and Westminster Review*, where many articles of his own appeared. In 1843, he published his *System of Logic*; in 1844, *Essays on some Unsettled Questions of Political Economy*; in 1848, the *Principles of Political Economy*; in 1859, an essay on *Liberty*; in 1860, *Discussions and Dissertations*; in 1863, a small work on *Utilitarianism*; in 1865, *Comte and Positivism*, and the *Examination of Sir William Hamilton's Philosophy*; in 1867 (when M. was rector of St Andrews University), his *Inaugural Address*; in 1868, *England and Ireland*; and in 1869, *The Subjection of Women*. A few months after his death his *Autobiography* appeared, which was read with a degree of eager interest rarely manifested.

MILLAIS, JOHN EVERETT, R.A., a celebrated English painter, was born at Southampton in 1829, entered the Royal Academy at the age of eleven, and in 1847 carried off the gold medal for his picture of 'The Tribes of Benjamin seizing the Daughters of Shiloh,' exhibited, in the following year, at the British Institution. Before this period, he had acquired a considerable reputation among younger painters by his avowed antipathy to the principles of art which then prevailed. His views were shared in by other students, such as Holman Hunt (q. v.), Dante Rossetti (q. v.), and Charles Collins, and a sort of artistic fraternity was formed, which obtained the name of the *Pre-Raphaelite School*. M.'s principal paintings are: 'Our Saviour' (1850), 'Mariana in the Moated Grange' (1851), 'The Huguenot' and 'Ophelia' (1852), 'The Order of Release' and 'The Proscribed Royalist' (1853), 'The Rescue' (1855), 'Autumn Leaves' (1856), 'The Heretic' (1858), 'Spring Flowers' (1860), 'The Black Brunswicker' (1861), 'My First Sermon' (1863), 'My Second Sermon' (1864), 'Joan of Arc' (1865), 'Sleeping,' 'Waking,' and 'Jephtha' (1867). Opinions differ in regard to M. as an artist. No respectable critic, however, denies or even doubts his wonderful gift of subtle imagination and deep sentiment. He is profoundly poetical, and has probably never been surpassed in his power of representing intense feeling and thought through the medium of colour and composition; but his perverse affectation, and proud contempt for what he regards as 'conventionalism,' have marred the finest of his productions.

MILLEDGEVILLE, capital of Georgia, United States of America, on the west bank of the Oconee River, 150 miles north-west of Savannah, in a rich cotton country. It has a state-house, governor's

residence, state buildings, and several churches. Pop. about 2500.

MILLENNIUM (Lat. a thousand years' time) designates a certain period in the history of the world, lasting for a long indefinite space (viz. a thousand years), during which the kingdom of Messiah will, according to tradition, be visibly established on the earth. The idea originated proximately in the Messianic expectations of the Jews; but more remotely, it has been conjectured, in the Zoroastrian doctrine of the final triumph of Ormuzd over Ahriman, and was connected by the Christians with the *Parousia*, or Second Coming of Christ. The notion of a Golden Age, preserved by the converts from heathenism to Christianity, as well as the oppression and persecutions to which they were long subjected by the state authorities, were naturally calculated to develop and strengthen such hopes. The chief basis of the millenarian idea in Judaism as well as in Christianity, however, is the ardent hope for a visible divine rule upon earth, and the identification of the church with that of which it is merely a symbol. In the 1st c. of the church, millenarianism (the Greek equivalent of which, *chiliasm*, from *chilioi*, a thousand, is the term employed by the Fathers) was a widespread belief, to which the book of Daniel, and more particularly the pictorial predictions of the Apocalypse (chaps. xx. and xxi.), gave an apostolical authority; while certain prophetic writings, composed at the end of the 1st and the beginning of the 2d c.—such as the *Testament of the Twelve Patriarchs*, the *Fourth Book of Esdras*, the *Revelation of Saint Peter*, &c.; also the *Christian Sibylline Books*, the *Epistle of Barnabas*, the *Shepherd of the Pseudo-Hermas*, several Midrashim, Targums, and other works of a partly legendary character embodied in the *Talmud*—lent it a more vivid colouring and imagery. The unanimity which the early Christian teachers exhibit in regard to millenarianism, proves how strongly it had laid hold of the imagination of the church, to which, in this early stage, Immortality and future Rewards were to a great extent things of this world as yet. Not only the heretic Cerinthus, but even the orthodox doctors—such as Papias, Bishop of Hierapolis, Irenaeus, Justin Martyr, &c.—delighted themselves with dreams of the glory and magnificence of the millennial kingdom. The *Sibylline Books*, for instance, hold that the earth will be cultivated throughout its length and breadth, that there will be no more seas, no more winters, no more nights; everlasting wells will run honey, milk, and wine, &c. &c. Papias, in his collection of traditional sayings of Christ (*Kuriakon Logion Exegeseis*), indulges in the most monstrous representations of the rebuilding of Jerusalem, and the colossal vines and grapes of the millennial reign. Every vine will bear 10,000 branches, every branch 10,000 shoots, every shoot 10,000 sprigs, every sprig 10,000 bunches, every bunch 10,000 berries, every berry 36 times 25 gallons of wine; and if a Saint come to pluck a berry, they will all cry out: 'Pluck me, O Saint, I am better, and praise the Lord through me.' The *Talmud* calculates the height of the men of the millennium to be, as before the Fall, of 210–900 yards; the moon shall be, according to a prophetic dictum, like the sun; the sun shall be increased 343 times; and every Israelite will beget as many children as there were Israelites going out from Egypt—60,000. Each grape will be large enough to fill the biggest ship. Above all, however, the land of Israel will be free again, and the primitive worship restored with unheard-of splendour. 'Such a chiliasm,' Neander justly remarks, could only 'promote a fleshly eudaimonism;' and indeed

# MILLENNIUM.

ere long it called into more energetic activity the opposition of Gnostic spiritualism. According to the general opinion, which was as much Christian as Jewish, the millennium was to be preceded by great calamities, reminding us in some degree of the Scandinavian Ragnarök (or 'Twilight of the Gods'). The personification of evil appeared in *Antichrist*, the precursor of Christ (identified, during the 1st c., with Nero), who would provoke a frightful war in the land of Magog (Ezek. chaps. xxxviii. and xxxix.) against the people Gog, after which the Messiah—some say a double Messiah, one the son of Joseph, vanquished in the strife; the other, the victorious son of David—would appear, heralded by Elias, or Moses, or Melchizedek, or Isaiah, or Jeremiah, and would bind Satan for a thousand years, annihilate the godless heathen, or make them slaves of the believers, overturn the Roman empire, from the ruins of which a new order of things would spring forth, in which the 'dead in Christ' would arise, and along with the surviving saints enjoy an incomparable felicity in the city of the 'New Jerusalem,' which was expected to descend literally from heaven. To the innocence which was the state of man in Paradise, there was associated, in the prevalent notions of the millennium, the finest physical and intellectual pleasures.

In the Mosaic account of creation, we find the primitive ground for making the victorious era of the church last a thousand years. That account was regarded by the Jews and by the Judaic Christians as a type of the destinies of creation. Now, by a strictly literal interpretation of the 4th verse of the 90th Psalm, it was supposed that a day of God was arithmetically equal to a thousand years; hence the six days of creation were understood to indicate that the earth would pass through 6000 years of labour and suffering, to be followed by a seventh day—that is, 1000 years of rest and happiness. In the Book of Revelation (chap. xx.) this view is presented. Still, the rabbinical traditions differ widely among themselves as to the duration of the happy period. Instead of 1000 years, some of them count 40, 70, 90, 365, 400, 600, 2000, or 7000, or so many years as have elapsed from the creation of the world or the flood. The Gospel of Nicodemus makes it 900 years, &c. In fact, the systems of apocalyptic chronology were of a varied and somewhat arbitrary cast—according as their originators laid greater stress upon the Apocalypse, the Book of Daniel, the Song of Songs, the Jewish 'Gematria,' or Computation of Letters—a very pliable art in itself—or on astronomy, astrology, 'natural phenomena,' and the like.

The lapse of time chilling the ardour of the primitive Christian belief in the nearness of the Parousia, had without doubt also the tendency to give a more shadowy, and therefore a more spiritual aspect to the kingdom over which the expected Messiah was to reign. The influence of the Alexandrian philosophy contributed to produce the same result. Origen, for example, first started the idea, that instead of a perpetual opposition of Paganism to Christianity—instead of a final and desperate conflict between the two—instead of an insolent triumph on the part of the saints, and a servile submission on the part of the unbelievers, the real progress and victory of Christianity would consist in the gradual spread of the truth throughout the world, and in the voluntary homage paid to it by all secular powers. This was an immense advance on the views previously entertained. It is owing largely to Origen and his disciple Dionysius that more spiritual conceptions of the millennium finally established themselves in the church; at all events, they furnished the Fathers with the majority of their arguments.

Yet even in the Egypto-Alexandrian Church, millenarianism, in its most literal form, was widely diffused, and was only eradicated by the great wisdom and moderation of Dionysius. The Montanists (q. v.) generally, as might be expected from the enthusiastic tendencies of the sect, were extreme millenarians or chiliasts, and, being considered a heretical sect, contributed largely to bring Chiliasm into discredit, or, at all events, their own carnal form of Chiliasm, which Tertullian himself attacked. Caius, the Presbyter, in his 'Disputation' against the Montanist Proclus, traces its origin to the hated heretic Cerinthus, whom he accuses of forging a certain revelation, which he passed off as the work of an apostle. From his description of this revelation, it is almost certain—strange as it may appear—that he alludes to the canonical Apocalypse. Lactantius, in the beginning of the 4th c., was the last important church Father who indulged in chiliastic dreams, while among its earlier advocates may be mentioned chiefly Nepos, Methodius, Korakion, Apollinarius, Victorinus, &c. In the 5th c., St Jerome and St Augustine expressly combated certain fanatics who still hoped for the advent of a millennial kingdom whose pleasures included those of the flesh. But from this time, the church formally rejected millenarianism in its sensuous 'visible' form, although the doctrine every now and then made its reappearance, especially as a general popular belief, in the most sudden and obstinate manner. Thus the expectation of the *Last Day* in the year 1000 A. D. re-invested the doctrine with a transitory importance; but it lost all credit again when the hopes, so keenly excited by the Crusades, faded away before the stern reality of Saracenic success, and the predictions of the *Everlasting Gospel*, a work of Joachim de Floris, a Franciscan abbot (died 1212), remained unfulfilled.

At the period of the Reformation, millenarianism once more experienced a partial revival, because it was not a difficult matter to apply some of its symbolism to the papacy. The Pope, for example, was *Antichrist*—a belief still adhered to by some extreme Protestants. Yet the doctrine was not adopted by the great body of the Reformers, but by some fanatical sects, such as the Anabaptists and by the Theosophists of the 17th century. During the civil and religious wars in France and England, when great excitement prevailed, it was also prominent. The *Fifth Monarchy Men* of Cromwell's time were millenarians of the most exaggerated and dangerous sort. Their peculiar tenet was, that the millennium *had* come, and that *they* were the saints who were to inherit the earth. The excesses of the French Roman Catholic Mystics and Quietists terminated in chiliastic views. Among the Protestants, it was during the *Thirty Years' War* that the most enthusiastic and learned chiliasts flourished. These may—broadly—be brought under the three chief heads of *Ezegetical* Chiliasts, who, by some biblical dates, endeavoured to compute the predicted time; *Alchemistic* or *Kabbalistic* Chiliasts, who endeavoured to hasten the period by some mystical discovery; and *Politico-theocratic* Chiliasts, who wished to reduce the governments of the world to a biblical standard. See ANABAPTISTS, MÜNZER. The awful suffering and widespread desolation of that time, led pious hearts to solace themselves with the hope of a peaceful and glorious future. Since then the penchant which has sprung up for expounding the prophetic books of the Bible, and particularly the Apocalypse, with a view to present events, has given the doctrine a faint semi-theological life, very different, however, from the earnest, practical faith of the first Christians. Among the foremost chiliastic teachers of modern centuries are to be

of the whole world to Christianity, a blissful and glorious era will ensue; but not much stress—except by extreme literalists—is now laid on the nature or duration of this far-off felicity. In fact, the common Christian conception of a millennium without a visibly present Christ, as held at the present day, is little different, so far as results are concerned, from the belief of philosophers in the perfectibility of the race. The essence of both conceptions is the cessation of sin and sorrow, the prevalence of holiness and happiness. But this departs widely from the 'ancient hope of the church'—a kingdom of visible majesty, with Jesus and the saints ruling the world from Jerusalem, the central city of the earth!

Great eagerness and not a little ingenuity have been exhibited by many persons in fixing a date for the commencement of the millennium. The celebrated theologian, Johann Albrecht Bengel (*Erklärte Offenbarung; Reden für's Volk*), who, in the 18th c., revived an earnest interest in the subject among orthodox Protestants, asserted from a study of the prophecies that the millennium would begin in 1836. This date was long popular. Bengel's general millenarianism was adopted by Oetinger (d. 1782), and widely spread throughout Germany in a more or less poetic form by Hahn, Crusius, Jung Stilling, Lavater, and Hess (*Briefe über die Offenb. Joh.*). Some of the greatest of the more recent German theologians are millenarians, such as Rothe, Delitzsch, Hoffmann, Kurtz, Hebart, Thiersch, Nitzsch, P. Lange, and Ebrard. Swedenborg, to whom reference has already been made, held that the last judgment took place in 1757, and that the New Church, or 'Church of the New Jerusalem,' as his followers designate themselves—in other words, the millennial era, then began. In America, considerable agitation was excited by the preaching of one William Miller, who fixed the second advent of Christ about 1843. Of late years, the most noted English millenarian is Dr John Cumming, who originally placed the end of the *present dispensation* in 1866 or 1867; but as that time drew near without any millennial symptoms, he was understood to have modified his original views considerably, and now conjectures that the beginning of the millennium will not differ so much after all from the years immediately preceding it, as people commonly suppose.—See Corrodi's *Kritische Ges-*

*Chromola marginata* is common in the stones and among moss. Some of the species are large and finely coloured.

MILLER, HUGH, a distinguished geologist, born in Cromarty, in the north of Scotland, 10, 1802. He was descended from a family and lost his own father by a storm at sea when he was only five years of age. In consequence of this misfortune, he was brought up chiefly in the care of two of his mother's uncles, one of whom ('Uncle Sandy') imbued him with a love of natural history, and the other ('Uncle James') with a love of English literature. He acquired a good knowledge of English at the Cromarty grammar-school, and in his 11th year, he had read those glorious works of childhood, *Jack the Giant-killer*, *Jack the Bean-stalk*, *Sinbad the Sailor*, *The Yellow Dwarf*, *Aladdin and the Wonderful Lamp*, besides other works of higher literary pretensions. As he grew older, he became extremely fond of English poets and prose writers. From his 14th year, he worked as a common mason, devoting his leisure hours to his researches in natural history, and to the acquisition of his literary knowledge. In 1829, he published a volume, entitled *Poems written in the Hours of a Journeyman Mason*, which was a few years afterwards, by *Scenes and Legends of the North of Scotland*. His attention was soon attracted to the ecclesiastical controversies which were then raging in Scotland, and his famous *Letter to Lord Jeffrey*, on the 'Auchterarder Case,' brought him prominently into notice. In 1840, he went to London as editor of the *Witness*, a newspaper started by the Non-intrusion party in the north of Scotland; and, in the course of the same year, he published in its columns a series of geological articles, which were afterwards collected under the title of *The Old Red Sandstone, or New Walks in the Field*. These articles were very remarkable in a scientific and literary point of view, and contained a minute account of the author's observations of fossils in a formation believed, until then, to be destitute of them, and written in a style of a harmonious combination of strength and polish. At the meeting of the British Association in the same year (1840), he was warmly welcomed by Murchison and Buckland, and his geological discoveries were the principal topic of

are: *First Impressions of England and Footprints of the Creator, or the Asterolepis*, designed as a reply to the *Vestiges of the History of Creation*; *My Schools Masters, or the Story of my Education*; *Sony of the Rocks*, the last of which is an attempt to reconcile the geology of the Pentateuch with the geology of nature, by the hypothesis mentioned in the first chapter of the book, not to represent the actual duration of the periods of creation, but only the time which God in unrolling a panoramic vision of the periods before the eyes of Moses in the

visions to science have undoubtedly been given. He is even more distinguished as a man than as a poet. Honest, high-minded, earnest, and industrious, a true Scot, a hearty, but not a hysterical (for he loved Robert Burns as he revered John Knox), there are few men from his country has better reason to be proud of than 'the stone-mason of Cromarty.'

**MILLET'S THUMB.** See BULLHEAD.

**MILLET**, a grain, of which there are several species of *Panicum*, *Setaria*, and other genera. The genus *Panicum* contains many species, natives of tropical and warm temperate countries, and some of which, as *Guinea Millet*, are amongst the largest fodder grasses. They are in spikes, racemes, or panicles; some very unequal, one of them often very unequal, each spikelet containing two florets, one of them barren. The genus *Setaria* has a single panicle, with two or more bristles under each spikelet.—**COMMON M.** (*Panicum polare*) is an annual grass, three or four feet high, covered with long hairs, which stand at right angles. It has a much-branched panicle; the spikelets are oval, and contained in a sheath. It is a native of the East Indies, but is widely cultivated in the warmer parts of other quarters of the world. It succeeds in warm climates in which wine can be produced; it is called *Warree*, *Cheena*, and *Kadi-kane*. The grain, which is very nutritious, is one-eighth of an inch in length. It is made into a form of groats, or in flour mixed with wheat, which makes a good kind of bread; made of M. alone is brittle and full of chaff; but poultry are extremely fond of millet. The seed for feeding cattle.—Other species, *P. frumentaceum*, and *P. pilosum*, are in different parts of India, chiefly on rather dry soils, yielding very abundant crops. **GERMAN M.**, or **MOHAR** (*Setaria Germanica*), is a M. (*S. Italica*), regarded by many as one species, and probably originally from the East, although now naturalised in the West. It is cultivated in many of the parts of Europe, in India, and other parts. Italian M. is three or four feet in height; much dwarfer, and its spike comparatively compact, and erect; and less valuable than the others. The grains of both are very small, half as long as that of Common M.; but extremely prolific, one root producing many spikes of Italian M. often yielding a bushel of grain. The produce is estimated as that of wheat. Italian M. is called *Kala-kangnee*, and *Kora-kang* in India. These millets are imported into Britain for cage-birds, and for use as a light and delicate food, although for this purpose it is not so good in Britain, whilst it is very extensively used, &c., in the south of Europe. It does not

make good bread. To the same tribe of grasses belong the genera *Paspalum*, *Pennisetum*, *Penicillaria*, *Digitaria*, and *Milium*—species of which are cultivated in different parts of the world for their grain. *Paspalum exile* is the *Fundi* (q. v.) of Africa; and *P. scrobiculatum* is the *Koda* of India, where it is cultivated chiefly on poor soils. *Penicillaria spicata*, or *Pennisetum typhoideum*, is very extensively cultivated in Africa, and to a considerable extent in India. Its cultivation has been introduced into the south of Europe. It succeeds best on light soils. Its Indian name is *Bajree*. It often receives the names **EGYPTIAN M.** and **GUINEA CORN**. It has a somewhat spiked, cylindrical panicle.—*Pennisetum distichum* abounds in Central Africa, on the southern borders of the Great Desert, where it is called *Uzak*, and is described by Barth as causing much inconvenience to the traveller, the little bristles which are attached to its seeds making them stick like burs to the clothes; they also pierce the skin, and cause sores, so that it is necessary to be provided with small pincers for their extraction, and none even of the wild roving natives is ever without such an instrument. But its seed is a common and pleasant article of food, in some places the principal food of the people, and a pleasant beverage is made from it.—*Digitaria sanguinalis* is called **POLISH M.**, being cultivated in cottage-gardens in Poland, where the grain is used like rice. It is a common grass in many parts of Europe, although very rare in Britain. The spikes in this genus are compound, and from their appearance give it the names *Digitaria* and *Finger-grass*.—The **M. GRASS** (*Milium effusum*) of Britain, occasionally found in shady woods, is a very beautiful grass, three or four feet high, with a spreading pale panicle of small flowers; and has been much recommended for cultivation as a forage grass, and for the sake of its very abundant small seeds, an excellent food for game. Another species of the same genus (*M. nigricans*) is the *Maize de Guinea* of Peru, where its seeds, after being dried by heat, are converted into a very white flour, a pleasant article of food; and a beverage called *ullpu* is made from them.—The name **INDIAN M.** is sometimes given to *Durra* (q. v.), but it belongs to a different tribe of grasses from the true millets.

**MILLRIND**, or **FER DE MOULIN**, in Heraldry, a charge meant to represent a mill-iron, originally a mere variety in designating the cross moline, but accounted a distinct charge by some heralds.

Millrind.

**MILMAN**, HENRY HART, D.D., an English poet and ecclesiastical historian, was the youngest son of Sir Francis Milman, physician to George III., and was born in London, 10th February 1791. He was educated at Eton, and afterwards at Brasenose College, Oxford, where he took the degree of M.A., obtained the Newdegate Prize in 1812, published *Fazio, a Tragedy* (which was successfully brought upon the stage at Covent Garden), in 1815; took orders in 1817, and, shortly after, was appointed vicar of St Mary's, Reading. In the following year appeared his *Samor, Lord of the Bright City, an Heroic Poem*, which was followed in 1820 by the *Fall of Jerusalem*, a beautiful dramatic poem, with some fine sacred lyrics interspersed. In 1821, M. was chosen Professor of Poetry at Oxford, and published three other poems in the course of the same year—*The Martyr of Antioch*, *Belshazzar*, and *Anne Boleyn*. His *Sermons at the Bampton Lecture* appeared in 1827, and his *History of the Jews* (3 vols.) in 1829. The last of these works did not bear

the author's name; it was written in so liberal and tolerant a spirit, that ecclesiastics of the stricter sort could hardly fail to be offended. Its weak point was a want of adequate learning, especially in the department of biblical criticism. A new edition, greatly improved, and more critical, yet still far from being very accurate, or built on solid foundations, with an interesting preface, was published in 1863. In 1840 appeared a collected edition of his *Poetical Works*, containing some other pieces besides those already mentioned. The same year witnessed the publication of his *History of Christianity from the Birth of Christ to the Abolition of Paganism in the Roman Empire* (3 vols.). In 1849 he was made Dean of St Paul's; and in 1854 published his master-piece, *History of Latin Christianity, including that of the Popes to the Pontificate of Nicholas V.* (3 vols.). It is a work of great learning, liberality, and chastened eloquence; it displays a broad grasp of human nature in its religious workings; something of the philosopher, and still more of the poet, is seen in the strong and vivid spirit of sympathy with which he deals with men of the most different opinions. The work secured for its author a position in the first rank of English historians. M., besides, edited Gibbon, and contributed extensively to the *Quarterly Review*. He died in 1868.

MILNE-EDWARDS, HENRI, the most eminent living representative of the French school of natural history, was born at Bruges in 1800. His father was an Englishman. M. studied medicine at Paris, where he took his degree of M.D. in 1823, but abandoned medicine to devote himself to natural history. He was first appointed Professor of Natural History in connection with the Lycée Henri Quatre, and afterwards to the Museum and the Faculté des Sciences, of which he is now President. In 1838, he was elected a member of the Academy of Sciences (section of Anatomy and Zoology); and in 1854 was chosen a member of the Académie de Médecine. He is also a member of many other societies, French and foreign, and a commander of the Legion of Honour. M. is distinguished for his extensive knowledge of comparative anatomy and physiology, as well as of zoology. Passing over some of his early works, which, though valuable, are thrown into the shade by his later ones, we come to his *Monograph on the Crustacea* (1837—1841), which is universally regarded as of pre-eminent merit, not only for its richness of detail, but also for the value of the general doctrines relating to homologies, development, geographical distribution, and other points of the highest physiological interest. In 1840, an improved edition of his *Elements of Zoology*, a work in 4 vols., and containing 600 illustrations, began to appear. In 1841, he published his researches on the Compound Ascidian Mollusca, which have led to an entirely fresh appreciation of some of the most important points in the history of that group, such as, that propagation by gemmation, which had been previously supposed to be a zoophytic character, is equally true of the lower mollusca. In other departments of science, M. has been equally successful; but it is to the invertebrate animals that his chief attention has been given, and in each of the three Cuvierian sub-kingdoms, *Articulata*, *Mollusca*, and *Radiata*, his researches have been so important, that what he has accomplished for either alone would suffice to establish for him a high scientific reputation. In 1856, M. obtained the Copley Medal of the Royal Society of London. His last publication of importance is his *Lectures on Physiology*, and on the *Comparative Anatomy of Men and Animals* (1855—1857).

MILNER, JOSEPH, an ecclesiastical historian who

once occupied a respectable place in literature, was born near the town of Leeds, in Yorkshire, January 2, 1744. He studied at Catharine Hall, Cambridge, where he took the degree of B.A. in 1766, and afterwards became head-master of the grammar-school at Hull. In this capacity, his success was very great. Shortly after, he was appointed lecturer in the principal church of the town, and in 1797, vicar of Holy Trinity Church. He died November 18th of the same year. M.'s principal work is his *History of the Church of Christ*, of which he lived to complete 3 vols., reaching to the 13th c. (1794); a fourth volume, reaching to the 16th c., was edited from his MSS. by his brother, Dr. ISAAC MILNER, Dean of Carlisle, who also published a complete edition of his brother's works in 8 vols., 1810. The principles on which *The History of the Church of Christ* is written are of the narrowest kind; the scholarship is poor, the literary merit still poorer, and the critical insight poorest of all. It deserves mention only for the estimation in which it was formerly held, at a time when the English Church seemed sunk in ignorance and stupor.

MILNES, RICHARD MONCKTON, BARON HOUGHTON, English poet and politician, descended from an old Yorkshire family, was born in 1800, and educated at Trinity College, Cambridge. He entered parliament as M.P. for Pontefract in 1837, and continued to represent that borough until the close of the parliamentary session of 1863, when he was called to the Upper House by the title of Baron Houghton. In the House of Commons he began life as a Conservative, but afterwards allied himself to the Liberal party, and was a faithful follower of Lord Palmerston, when his foreign policy and high-handed dealings at the Foreign Office led to the temporary estrangement of that statesman from the Whigs. M. has distinguished himself, however, rather by his philanthropic labours, and his speeches on behalf of the Italians, Poles, and other oppressed nations, than by his devotion to party politics. He has been the advocate of public education and religious equality. He carried, in 1846, a bill for establishing Reformatories, and has taken a great interest in the reform of the criminal classes. M. has also cultivated the muses with grace and success. He has travelled much in oriental countries, and is the author of *Memorials of a Tour in Greece*, and also of poems called *Palm Leaves*, in which a poetical halo is thrown around the manners and domestic institutions of the East. His *Poems of Many Years*, and *Poems Historical and Legendary*, contain many simple and elegant effusions. In 1849, he edited the *Life, Letters, and Literary Remains of John Keats*. He has written *Thoughts on Parity of Election*, and many political and literary articles for periodical publications.

MILO, of Croton, in Magna Græciæ (q. v.), an athlete famous for his great strength, who lived, according to Herodotus, in the time of Darius Hystaspes, about 520 B.C. Among other displays of his strength, he is said to have on one occasion carried a live ox upon his shoulders through the stadium of Olympia, and afterwards to have eaten the whole of it in one day; and on another occasion the story of the Hebrew Samson, to have upheld the pillars of a house in which Pythagoras and his scholars were assembled, so as to give them time to make their escape when the house was falling. He is said to have lost his life through too great confidence in his own strength, when he was getting old, in attempting to split a tree, which closed upon his hands, and held him fast until he was devoured by wolves.

**MILREE', MILREI, or MILREA**, a Portuguese silver coin and money of account, contains 1000 rees, and is valued at 4s. 8½d. sterling. The coin is commonly known in Portugal as the *corôa*, or 'crown,' and is (since 24th April 1835) the unit of the money-system in that country. It is used in Brazil. The half-*corôa*, or half-milrei, of 500 rees, is also used in both countries. The name 'milrei' was used in Portuguese accounts long before any coin representing its value existed.

**MILTIADES**, a celebrated Athenian general, 'tyrant of the Chersonese,' yet, as Byron sings, 'freedom's best and bravest friend.' Forced by Darius to flee from his dominions, he took refuge at Athens, and on the second Persian invasion of Greece, his military talents being of a high order, he was chosen one of the ten generals. He particularly distinguished himself by the great victory which he gained at Marathon (q. v.) with a small body of Athenians and 1000 Plateans (29th September, 490 B. C.) over the Persian host, under Datis and Artaphernes. By this victory, the Greeks were emboldened for the heroic struggle which they made in defence of their country and their liberty. M. being intrusted with the command of an armament for the purpose of retaliating on the Persians, made an attack on the island of Paros in order to gratify a private enmity; but failing in the attempt, he was, on his return to Athens, condemned to pay a heavy fine as an indemnification for the expenses of the expedition. Being unable to do this, he was thrown into prison, where he died of a wound received at Paros. The fine was exacted after his death from his son Cimon (q. v.).

**MILTON, JOHN**, an English poet, was born in Broad Street, London, on the 9th December 1608. His father was of an ancient Catholic family, but was disinherited on becoming Protestant. He followed the occupation of a scrivener, by which, according to Aubrey, 'he got a plentiful estate,' and was a man of great musical accomplishment, being the composer, among other things, of the two well-known psalm-tunes *Norwich* and *York*. From him his son derived his matchless ear, and that strict integrity of character for which he is as famous as for his verse.

M. was carefully nurtured and educated. He was first placed under the care of a private tutor named Young, a Scotchman by birth and education; and at the age of twelve, was sent to St Paul's School, London, and afterwards to Christ's College, Cambridge. According to the University Register, he was admitted 12th February 1624—1625. He took his degree of M.A.; and having relinquished the idea of following divinity or law, he left Cambridge in 1632, and went to live at his father's house at Horton, in Buckinghamshire. There, in serenity of mind and passion, he lived five years, reading the Greek and Latin poets, and composing *Comus*, *Lycidas*, *Arcades*, *L'Allegro*, and *Il Penseroso*. On the death of his mother in 1637, he went abroad, visiting the chief Italian cities, and making the acquaintance of Grotius and Galileo. While travelling, being made aware that clouds were gathering in the political atmosphere at home, he returned in 1639, and engaged himself with the tuition of his nephews—on which portion of M.'s life, Dr Johnson could not help looking with 'some degree of merriment.' In 1641, he engaged in the controversies of the times, and in the course of that and the following year, he issued the treatises *Of Reformation*, *The Reason of Church Government urged against Prelacy*, *Prelatical Episcopacy*, and *An Apology for Smectymnua*. In 1643, he married rather suddenly Mary, daughter of Richard Powell, an Oxfordshire

royalist, but the union did not at first prove happy. His wife, who had been accustomed to 'dance with the king's officers at home,' found her husband's society too austere and philosophic for her gay tastes. After the severe honeymoon was over, she obtained permission to visit her relatives till Michaelmas; but when Michaelmas came, she refused to return. Stern and proud, M. repudiated her at once; and the matrimonial disagreement made the world the richer by four *Treatises on Divorce*. A reconciliation, however, took place, which, we have no reason to doubt, was both genuine and permanent. Mary Powell died in 1652—1653, leaving him three daughters, Ann, Mary, and Deborah, of whose undutifulness and ingratitude we have latterly many complaints. In 1644 he produced his *Tractate on Education* and his *Areopagitica*—a flame of eloquence at which one may warm one's hands yet. After the execution of Charles, he was appointed Latin secretary to the Council of State, with a salary of £290. In his new position, his pen was as terrible as Cromwell's sword. In *Eikonoklastes*, he made a savage but effective reply to the famous *Eikon Basilike*; and in his *Pro Populo Anglicano Defensio* he assailed his opponent, Claude de Saumaire, better known as *Salmasius*, with such a storm of eloquence and abuse, that the latter, who died at Spa in 1653, is believed to have lost his life through chagrin. M. at least flattered himself with having 'killed his man.' His second wife, whom he married 12th November 1656, was a daughter of Captain Woodcock of Hackney. She died in childbed in February 1658, and her husband has enshrined her memory in an exquisitely pure and tender sonnet.

Unceasing study had affected his eyesight, and about 1654, M. became totally blind. After the Restoration, he retired from affairs; he was obnoxious to the reigning power, and it is said that he was once in custody of the sergeant-at-arms. On the publication of the Act of Oblivion, he married his third wife, Elizabeth Minshull, and shortly after removed to a house in Artillery Walk, when he was busy with *Paradise Lost*. This great poem was originally planned as a mystery, then some idea of treating it as a drama haunted the author's mind; finally, however, he resolved to write an epic poem on the Fall of Man. The poem was published in 1667. He received five pounds from his publisher, and a promise of other five pounds when 1300 copies should have been sold. In 1670, he published his *History of England*. Next year, he printed *Paradise Regained* and *Samson Agonistes*. He died on Sunday, the 8th November 1674, and was buried next his father, in the chancel of St Giles, at Cripplegate. He left property to the value of £1500.

M. was, above all English poets, stately and grandiose. He arrived early at the knowledge of his powers, and did not scruple, in one of his prose tracts, to inform his readers that he purposed to write a poem which would be considered one of the glories of his country. Drawn away for a time by the heats of controversy and by official tasks, he never forgot his pledge, and redeemed it at last in old age, blindness, and neglect. In comparison, other poets are like sailing-ships, at the mercy of the winds of Passion and Circumstance; he resembled the ocean-steamer, which, by dint of internal energy, can pierce right through the hurricane. Never, perhaps, was a mind more richly furnished. His careless 'largess' is greater than the fortunes of other men. His *Comus* is the very morning-light of poetry; while in his great epic there is a massiveness of thought, a sublimity of imagery, a pomp of sound—as of rolling organs and the outbursting of cathedral choir—which can be found nowhere else.

His great passages echo in the mind as if loath to die. Of all great writers, he is perhaps the one for whom we are conscious of the least personal affection, and this arises from a certain hauteur and severity which awes—which repels some natures. He infects his reader with his own seriousness. He is withdrawn from the ordinary world of men, but it is as an Alp is withdrawn—by vastness, by solitariness of snows, by commerce with heaven.

MILWAUKEE, a city of Wisconsin, United States of America, on the western shore of Lake Michigan, at the mouth of Milwaukee River or Creek, which forms its harbour. The town, beautifully built with light yellow bricks, crowns a high bluff on the lake, and contains county buildings, custom-house, and post-office, 43 churches, public schools, female college, banks, insurance companies, asylums, hospital, and many daily and weekly papers. Four railways connect the city with a country of great fertility. In extent of marine commerce, M. ranks fourth among the cities of the union; and it has great advantages as a manufacturing centre. The grain received at M. in 1869 amounted to 19,407,054 bushels. Pop. (1860) 45,254; (1870) 71,440.

MĪMĀNSĀ (from the Sanscrit *mān*, to investigate; hence, literally, investigation) is the collective name of two of the six divisions of orthodox Hindu philosophy. See SANSKRIT LITERATURE. It is distinguished as *Pārva-* and *Uttara-mīmāṃsā*, the latter being more commonly called *Vedānta* (q. v.), while the former is briefly styled *Mīmāṃsā*. Though the M. is ranked, by all native writers, with the five other philosophical systems, the term philosophy—as understood in a European sense—can scarcely be applied to it; for the M. is neither concerned with the nature of the absolute or of the human mind, nor with the various categories of existence in general—topics dealt with more or less by the other five philosophies; its object is merely to lay down a correct interpretation of such Vedic passages as refer to the Brāhmaṇic ritual, to solve doubts wherever they may exist on matters concerning sacrificial acts, and to reconcile discrepancies—according to the M., always apparent only—of Vedic texts. The foundation of this system is therefore preceded by a codification of the three principal Vedas—the R̥ik, Black-Yajus, and Sāman—and by the existence of schools and theories which, by their different interpretations of the Vedic rites, had begun to endanger, or, in reality, had endangered a correct, or at least authoritative understanding of the Vedic texts. It is the method, however, adopted by the M. which imparted to it a higher character than that of a mere commentary, and allowed it to be looked upon as a philosophy; for, in the first place, the topics explained by this system do not follow the order in which they occur in the Vedic writings, especially in the Brāhmaṇa portion of the Vedas (q. v.); they are arranged according to certain categories, such as authoritativeness, indirect precept, concurrent efficacy, co-ordinate effect, &c.; and secondly, each topic or case is discussed according to a regular scheme, which comprises the proposition of the subject-matter, the doubt or question arising upon it, the *primā-facie* or wrong argument applied to it, the correct argument in refutation of the latter, and the conclusion devolving from it. Some subjects treated of in the M., incidentally as it were, and merely for the sake of argument, belong likewise more to the sphere of philosophic thought than to that of commentatorial criticism, such, for instance, as the association of articulate sound with sense, the similarity of words in different languages, the

inspiration or eternity of the Veda, the invisible spiritual operation of pious acts, &c. The real founder of this system is Jaimini—of unknown date—who taught it in twelve books, each divided into four chapters, except the third, and tenth books, which contain eight chapters each; the chapters, again, are divided into sections generally comprising several Sūtras or aphorisms but sometimes only one. The extant commentary on this obscure work is the *Bhāṣya* of Śaṅkara swāmin, which was critically annotated by the great M. authority, Kumārila-swāmin. Of these works, which, in their turn, quote many others, apparently lost, has arisen a great number of other writings, explaining and elucidating predecessors. The best compendium, among modern works, is the *Jaiminiya-nyāya-māla* by the celebrated Mādhavāchārya (q. v.).

MIMES, the name given by the ancients to certain dramatic performances, in which, without attempt at art, scenes of actual life were represented, sometimes in improvised dialogue. Greek mimes appear to have been invented by the Greeks of Sicily and Southern Italy. They were a favourite amusement of convivial parties, the performers themselves being generally the performers. Sostratus of Syracuse, about 420 B. C., composed many mimes in the Doric dialect, which were much admired, and Plato was accustomed to read.—The Roman mimes were not borrowed from the Greek, but were of native Italic growth. They were not only far more and coarser, but in some respects they were even different—the dialogue occupying a smaller space, and mere gesture and mimicry predominating. Humour and satire, however, were often got in, though rough, and even indecent, and they were greatly relished by all classes; even the patrician Sulla was fond of them.

MIMOSEÆ, a sub-order of Leguminosæ, one of the largest natural orders of exogenous plants; distinguished by regular flowers and petals valvate in bud. About 1000 species are known, all natives of warm climates, a few only extending beyond subtropical regions in the southern hemisphere. The genera *Acacia* (q. v.) and *Mimosa* are the best known.

Mimosa Nilotica.

the latter genus belong the Sensitive Plants (&c.). Some of the larger species of M. are valuable timber trees. The TALHA (*Mimosa ferruginea*) is one of the most common trees of Central Africa. The *Acacia* are also trees of great beauty. Some species of the genus *Prosopis*, natives of the western part

South America, are remarkable for the abundance of tannin in their pods.

**MIMULUS**, a genus of plants of the natural order *Scrophulariaceae*, having a prismatic 5-toothed calyx, a somewhat bell-shaped corolla, of which the upper lip is bifid and the lower lip trifid, the lobes not very unequal, two long and two short stamens, and stigma of two lamellæ, which close together upon stimulation. The species are mostly herbaceous plants, natives of America. Some of them are very frequent in flower-gardens, and many fine varieties have been raised from cultivation. They sometimes receive the name of *Monkey-flower*. One species, *M. luteus*, native of Peru and Chili, has become naturalised in many parts of Britain. The little yellow-flowered **ROSE PLANT**, now so common in gardens and on window-sills in Britain, is *M. moschatus*, a native of Oregon and other north-western parts of America.

**MINA**, or **MNA**, the name of a Greek weight and money denomination, derived from an oriental word *menek*, signifying 'weight.' The mina contained 60 Drachmæ (q. v.), and was the sixtieth part of a talent; consequently, as a *weight*, it was equivalent to about  $1\frac{1}{2}$  of a pound avoirdupois, varying in different districts to the extent of one-third of a pound more or less, following the fluctuations of the metal itself. As a *money of account*, it preserved the same relation to the talent, and was worth 1*s.* 3*d.* See **TALENT**.

**MINA BIRD** (*Eulabes Indicus* or *Gracula indica*), a species of Grackle (q. v.), or of a nearly allied genus, a native of many parts of the East Indies, about the size of a common thrush, of a deep lustrous black colour, with a white mark on the base of the quill-feathers of the wings, yellow bill and feet, and two large bright yellow wattles at the back of the head. The bill is large, conical; the upper mandible a little curved, and sharp-pointed. The food of the M. B. consists of fruits and insects. It is very lively and intelligent, and possesses a power of imitating human speech, excelled by none of the parrots. It has sometimes been trained to repeat sentences of considerable length. It is therefore in great request, and is often brought to Europe.—Another and larger species is found in Sumatra and some of the other eastern islands, possessing the same power of articulation. It is highly prized by the Javanese.

**MINARET**, **MINAR**, a tall turret, used in Moslem architecture. It contains a staircase, and is divided into several stories, with balconies from which the priests summon the Mohammedans to prayer—bells not being permitted in their religion and is terminated with a spire or ornamental dial. The minarets are amongst the most beautiful structures of Mohammedan architecture, and are an invariable accompaniment of the Mosques (q. v.). In India, *Minars*, or pillars of victory, are frequently erected in connection with mosques; some of these are lofty and splendid monuments, that of Kootub, Old Delhi, being 48 feet 4 inches in diameter at base, and about 250 feet high. They are often built on a plan of a star-like form, and are divided into stories by projecting balconies, like the minarets.

**MINCH**, the channel which separates the island of Lewis from the counties of Cromarty and Ross, the north-west of Scotland. Its shores are exceedingly irregular, and its average width is about 28 miles. The *Little Minch*, which separates the island of Skye from that of North Uist and the neighbouring islands in the Outer Hebrides, is upwards of 20 miles in width.

**MINCIO** (anc. *Mincius*), a river of Northern Italy, a continuation of the Tyrolean stream, the

Sarca, emerges from Lake Garda at Peschiera, and after a course of about 38 miles through the province of Mantua, which it separates from Verona, falls into the Po, 8 miles below the city of Mantua. The M. has constituted an important basis of operation during the wars between Italy and Austria.

**MIND**. Having adverted in various other articles—**EMOTION**, **INTELLECT**, **WILL**, &c.—to the chief component parts of our mental constitution, all that is necessary under the present head is to consider the definition or precise demarcation of mind as a whole. In this subject, we cannot resort to the common method of defining, which is to assign something more simple and fundamental than the thing to be defined; as when we define gravity to be an *attractive force*, the notions of force and attraction being supposed to be more intelligible than gravity. Mind can be resolved into nothing more fundamental than itself; and therefore our plan must be, to call attention to those individual facts or experiences that are pointed at by the name, and to circumscribe, in some way or other, the whole field of such experiences. For an example of mind, we should probably refer each person to his pleasures and pains, which are a class of things quite apart and peculiar; we should also indicate thoughts or ideas, as mental elements; also exercises of will or voluntary action. There is a sufficient community of nature in those various elements to cause them to be classed by themselves, under a common designation, namely, mind. If any one could be made aware of all the phenomena that have received this designation, he would of course know the meaning in the detail; but this is not enough. Mind being a general or comprehensive name, we ought to see distinctly the common character or attribute pervading all those particular phenomena; the recognition of this common character is the knowledge of mind in general, or the determination of its defining attribute. For the settling of this common attribute, we have another great resource, besides comparing the individual facts, that is, to determine the opposite, or contrast of mind. Now the usually assigned contrast is matter; but more precisely, it is extension, or *the extended*, including both inert matter and empty space. When we are conscious of anything as having the property of Extension, our consciousness is occupied with the object world, or something that is not mind. When we are feeling pleasure or pain, remembering, or willing, we are not conscious of anything extended; we are said to be in a state of subjective consciousness, or to be exhibiting a phenomenon of mind proper. Hence, philosophers are accustomed to speak of the *in-extended mind*, as distinguished from the outer or object world. In one sense, everything that we can take cognizance of is mind or self; we cannot by any possibility transcend our own mental sphere; whatever we know, is our own mind; hence the idealism of Berkeley, which seemed to annihilate the whole external universe. But this large sense of mind is not what is usually meant, and whatever view we take of the reality of the external world, we must never merge the distinction between the consciousness of the Extended—which is also coupled with other truly object properties, as inertia, for matter—and the consciousness of the Inextended, as constituting our feelings and thoughts. This opposition is fundamental and ineradicable, and is expressed in language by a variety of designations; mind and not mind, subject and object, internal and external. The laws and phenomena of the Extended are set forth in the sciences of the external world—Mathematics, Mechanics, Chemistry, &c.; the laws of the Mind proper, or the Subject consciousness, are quite distinct in their nature, and are embodied

in a separate science, called Mental Philosophy, Psychology, &c.

**MINDANAO.** See PHILIPPINE ISLANDS.

**MI'NDEN**, a Prussian town, in the province of Westphalia, lies on the Weser, in  $52^{\circ} 20' N.$  lat., and  $8^{\circ} 40' E.$  long., and is a fortified, closely built city, with a population of (1872) 16,593. M., which ranks as one of the oldest towns in Germany, has a stone bridge across the river, originally erected in 1518, and possesses several ancient churches, the most noteworthy of which are the present Roman Catholic Church, completed in 1072, and the cathedral founded at the close of the 12th century. A battle was fought near M. in 1759, in which the French were defeated by an army of Anglo-Hanoverian troops.

The Hanoverian town of M. or *Münden* is situated in the district of Hildesheim, within the province of Göttingen, and at the confluence of the Fulda and Werra. Pop. (1872) 5491. M. lies in one of the most picturesque and fruitful parts of Hanover. It has 3 breweries and manufactories of china, earthenware, sugar, tobacco, and linen, with a noted linen-market. There are alum-works and good coal-mines in the immediate neighbourhood; and it has an extensive river transport-trade in millstones, corn, and timber. M. possesses several architectural remains, indicative of its former more prosperous condition.

**MINERAL CHAMELEON.** See MANGANESE.

**MINERAL KINGDOM**, the inorganic portion of nature. Under this term, however, are not included the inorganic products of organic beings, as sugar, resins, &c., although substances more remotely of vegetable or even animal origin are reckoned among minerals, as coal, fossils, &c. To the Mineral Kingdom belong liquid and gaseous, as well as solid substances; water, atmospheric air, &c., are included in it. All the chemical elements are found in the Mineral Kingdom, from which vegetable and animal organisms derive them; but many of the compounds which exist in nature belong entirely to the vegetable and animal kingdoms, and are produced by the wonderful chemistry of life.

**MINERAL RESINS.** See RESINS.

**MINERAL TALLOW**, or **HATCHETINE**, a remarkable substance found in several places in Britain, Germany, Siberia, &c., soft and flexible, yellowish white, or yellow, resembling wax or tallow, often flaky like spermaceti, inodorous, melting at  $115^{\circ}$ – $170^{\circ} F.$ , and composed of about 86 carbon and 14 hydrogen.

**MINERAL WATERS.** This term is usually applied to all spring waters which possess qualities in relation to the animal body different from those of ordinary water. Mineral waters have been used as remedial agents from a very early period. The oldest Greek physicians had great faith in their curative power, and the temples erected to *Æsculapius* were usually in close proximity to mineral springs; they had recourse to the sulphurous thermal springs of Tiberias (now Tabareah), which are still used by patients from all parts of Syria in cases of painful tumour, rheumatism, gout, palsy, &c., and to the warm baths of Calirrhoe, near the Dead Sea, which are mentioned by Josephus as having been tried by Herod in his sickness. We are indebted to the Romans for the discovery not only of the mineral thermic springs in Italy, but of some of the most important in other parts of Europe, amongst which may be named Aix-la-Chapelle, Baden-Baden, Bath, Spa in Belgium, and many others; and Pliny, in his *Natural History*, mentions a very large number of mineral springs in almost all parts of Europe.

The therapeutic action of mineral water spas, as they are frequently termed, depends upon their chemical composition and their nature, although a variety of other circumstances, situation, elevation, climate, geological mean temperature, &c., have an important upon the success of the treatment.

The best time for undergoing a course of waters is, in the majority of cases, the June, July, August, and September. There are, however, exceptions depending upon climate; for example, at Gastein, celebrated for its springs, the weather is changeable and is June and July, but pleasant in May, August, and September. Early rising is usually advisable in a course of mineral waters, and, as a general rule, water should be drunk before breakfast, at about a quarter of an hour between each moderate exercise being taken in the interval. In many cases, bathing is of even greater importance as a remedial agent than drinking. Bathing is generally taken between breakfast and dinner, and should never be taken soon after a full meal, nor during the time during which the patient should remain in bed. The time of day for bathing varies very much at different spas, and the directions of the local physician should be attended to on this point. It is impossible to determine beforehand how long a course of waters should be continued, as this entirely depends upon the symptoms observed during treatment. As a general rule, the treatment should not be protracted beyond the space of six weeks or months, but on this point the patient must be solely guided by the physician resident at the spa. It cannot be too forcibly impressed upon the patient that indulgence in the pleasures of the table, or excesses of any kind, frequently counteract the salutary effects of the waters, while perfect relaxation is an important auxiliary to the treatment. It will be seen from remarks on the nature of the cases likely to receive benefit from the various kinds of mineral waters, that spas are only suitable for patients suffering from chronic disorders.

No classification of mineral waters based upon their chemical composition can be strictly correct, because many springs are, as it were, intermediate between tolerably well characterised groups. The following classification, which is adopted by Althaus, in his *Spas of Europe* (Lond. 1862), is perhaps the most convenient: 1. Alkaline Waters; 2. Bitter Waters; 3. Muriated Waters; 4. Ems Waters; 5. Indifferent Thermal Waters; 6. Chalybeates; 7. Sulphurous Waters.

1. The Alkaline Waters are divisible into *Simple Alkaline Acidulous Waters*, of which the chief contents are carbonic acid and bicarbonate of soda. The most important spas of this class are the thermal springs of Vichy and the cold springs of Fachingen, Geinlau, and Bilin. These waters are useful in certain forms of indigestion, in jaundice arising from catarrh of the hepatic ducts, in gall stones, in renal calculi and gravel, in general chronic catarrh of the respiratory organs, and in abdominal plethora. Vichy (q. v.) may be taken as the representative of this class of springs. *Muriated Alkaline Acidulous Waters*, which are derived from the preceding sub-group in additionally containing a considerable quantity of chloride of sodium. The most important spas of this kind are the thermal springs of Ems, and the cold springs of Selters, Luhatschowitz, and Salzbrunn. These waters are useful in chronic catarrhal affections of the nasal tubes, the stomach, and the intestines, in the larynx; and the Ems waters possess a reputation in certain chronic diseases of the eye and adjacent organs. (c) *Alkaline Saline Waters*.

## MINERAL WATERS—MINERALOGY.

which the chief contents are sulphate and bicarbonate of soda. The most frequented of these spas are the warm springs of Carlsbad and the cold springs of Marienbad. Patients suffering from abdominal plethora are those most frequently sent to these spas, which often prove of great service, if the stagnation of the blood is owing to habitual constipation, pressure from accumulated feces, or congestion of the liver, unconnected with diseases of the heart or lungs. These waters, especially those of Carlsbad, afford an excellent remedy for the habitual constipation which so frequently arises from sedentary occupations; the result being much more permanent than that produced by strong purgative waters.

2 The chief contents of the Bitter Waters are the sulphates of magnesia and soda; and the best known spas of this class are those of Püllna, aidschütz, Sedlitz, Friedrichshall, and Kissingen; though there are two English spas—namely, the latter water of Cherry Rock, near Kingswood, in Gloucestershire, and the Purton Spa, near Swindon, Wiltshire—which 'are, by their chemical composition, admirably suited for the treatment of many cases of disease, and may perhaps even prove superior to the continental spas of this class.'—Althaus, *op. cit.* p. 360. These waters act both as cathartics and diuretics, and may therefore be used advantageously in the numerous cases in which it is advisable to excite the action both of the bowels and kidneys.

3. The Muriated Waters are divisible into: (a) *Simple Muriated Waters*, of which the chief contents are a moderate quantity of chloride of sodium or common salt. The chief spas of this class are Wiesbaden and Baden-Baden, which are hot; those of Ems (in Nassau), of Mondorf (near Luxembourg), and of Canstatt (near Stuttgart), which are tepid; and those of Kissingen, Homburg, and Cheltenham, which are cold. They are chiefly employed in cases of gout, rheumatism, scrofula, and abdominal anthora. (b) *Muriated Lithia Waters*, of which the chief contents are the chlorides of sodium and lithium. The discovery of lithia in some of the Baden-Baden springs is so recent that there is as yet no sufficient experience concerning their therapeutic action. In gout, they first aggravate the pain, but then give relief; and in periodic headache, they have been found serviceable. (c) *Brines*, whose chief contents are a large amount of chloride of sodium. Amongst the spas of this kind, those of Helme, in Westphalia, and Mannheim, in Hesse, have the greatest reputation. They are mostly employed for bathing, and are often of much service in scrofula, anemia, rheumatism, certain forms of paralysis, and catarrh of the mucous membranes.

4) *Iodo-bromated Muriated Waters*, in which, besides a moderate quantity of chloride of sodium, the iodides and bromides of sodium and magnesium are contained in an appreciable quantity. Kreuznach is the most celebrated of the spas of this class. Its waters are used both for drinking and bathing, and are of service in scrofulous infiltrations of the glands, in scrofulous ulcers, in chronic inflammation of the uterus and ovaries, &c. The waters of Hall, in Austria Proper, are also of this class, and have a high reputation in cases of bronchocoele or goitre.

5. Earthy Waters, of which the chief contents are sulphate and carbonate of lime. The most important waters of this class occur at Wildungen, Leuk, Bath, Lucca, and Pisa. The Wildungen water, which is exported in large quantities, is, according to Dr Althaus, 'a capital diuretic, and not only promotes the elimination of gravel and small calculi, but by its tonic action on the mucous membrane of the urinary passages, serves to prevent

the formation of fresh concretions. It is also much used for chronic catarrh of the bladder, neuralgia of the urethra and neck of the bladder, dysuria, and incontinence of urine.' The baths of Leuk, in which many patients remain nine hours daily (viz., from 4 A.M. to 10 A.M., and from 2 P.M. to 5 P.M.), until an eruption appears, are chiefly used in chronic skin diseases. The waters of Bath, Pisa, and Lucca, which are thermal, are useful in chronic skin diseases, scrofula, gout, rheumatism, &c.

6. Indifferent Thermal Waters, which usually contain a small amount of saline constituents. Of the spas of this class, the most important are Gastein (95° to 118°), Toplitz (120°), Wildbad (96°), Warmbrunn (100°), Clifton (86°), and Buxton (82°). Their most striking effects are to stimulate the skin and excite the nervous system. 'They are especially used in chronic rheumatism and atonic gout; in diseases of the skin, such as prurigo, psoriasis, lichen; in neuralgia and paralysis due to rheumatic and gouty exudations, to parturition, or to severe diseases, such as typhoid fever and diphtheria; in hysteria; and in general weakness and marasmus.'—Althaus, *op. cit.* p. 421.

7. Chalybeate Waters, which are divisible into: (a) *Simple Acidulous Chalybeates*, whose chief contents are carbonic acid and bicarbonate of protoxide of iron; and (b) *Saline Acidulous Chalybeates*, whose chief contents are sulphate of soda and bicarbonate of protoxide of iron. These waters are considered in a special article. See CHALYBEATE WATERS.

8. Sulphurous Waters, which contain sulphuretted hydrogen or metallic sulphides (sulphurets), or both. The most important sulphurous thermals are those of Aix-la-Chapelle, Baden (near Vienna), Barèges, Eaux-Chaudes, and Bagnères de Luchon; whilst amongst the cold sulphurous springs, those of Nenn-dorf (in Electoral Hesse) and Harrogate are of great importance. They are extensively used in chronic diseases of the skin, and are of service in many cases in which exudations require to be absorbed, as in swellings of the joints, in old gunshot-wounds, and in chronic gout and rheumatism. In chronic laryngeal and bronchial catarrh, they frequently give relief, and in chronic poisoning by lead or mercury, they favour the elimination of the poison, although to a far less degree than iodide of potassium taken internally. The sulphurous waters are employed externally and internally, and mineral mud-baths are believed by many physicians to form a valuable auxiliary to this treatment.

For further information on this subject, the reader is referred to the work of Dr Althaus (of which free use has been made in this article), and to the *Dictionnaire Général des Eaux Minérales et d'Hydrologie Médicale* of MM. Durand-Fardel, Le Bret, and Lefort.

**MINERALOGY** (Fr. *miner*, to dig, mine; Gael. *meinn*; Wel. *mun*, ore, mine), the science which treats of minerals. But it does not embrace all that relates to the mineral kingdom. *Simple minerals* alone, or homogeneous mineral substances, are regarded as the subjects of mineralogy; rocks formed by the aggregation of simple minerals, and their relations to each other, are the subjects of Geology (q. v.). This limitation of the term mineralogy is comparatively recent. Geology or geognosy was formerly included in it. The arrangement and description of simple minerals according to their external characters, has been called by Werner and others *Oryctognosy*, but the term has fortunately fallen into disuse. Nor is the study of mere external characters sufficient in mineralogy. The chemical composition of minerals equally demands attention. In the classification of minerals, some mineralogists, as Mohs and Jameson, have regarded only the

external characters, and some, as Berzelius, only the chemical composition; but the results have been unsatisfactory, and the present tendency is in favour of a system which seeks to constitute natural groups by having regard to both.

Some minerals being of great use, and others highly valued for their beauty, have received much attention from the earliest ages. But the ancient naturalists describe few minerals. The first attempt at scientific mineralogy was by George Agricola in the 16th century. The systems of the Swedes Wallerius and Cronstedt, in the latter half of the 18th c., were the first worthy of the name. That of Werner followed, and was extensively adopted. The discoveries of Haüy in crystallography, and the progress of chemistry, gave mineralogy a new character; and then sprung up two schools of mineralogists, one resting chiefly on external characters, and the other on chemical composition.

The chemical classification of minerals is rendered difficult by the endless variety of combination and proportion in the elements of which they are composed, the presence of substances not essential to the mineral, and yet more or less affecting its characters, and the frequent impossibility of determining what is to be deemed essential, and what accidental. Chemical purity is almost never found in nature. Even the purest diamond, when burned, leaves some traces of ash; and the various colours of diamond, quartz, and other minerals are due to the presence of substances which are often in so small quantity as not to affect their crystalline forms or other physical properties. Again, some minerals of identical chemical composition differ in their crystallisation, so that an arrangement founded upon it would separate them too widely. There are also many minerals which are often found in an uncrystallised state, and others which are always so. In the arrangement of minerals into natural groups, their chemical composition, although not alone to be regarded, is of the first importance, so that the place of a new mineral in the system can never be determined without analysis; and in determining the nature of a mineral, chemical tests, such as the application of acids, are continually resorted to. It is also necessary to know its specific gravity, and how it is acted upon both by a moderate heat and by the blowpipe. An examination of the crystalline forms, with measurement of the angles of the crystals, is often sufficient to distinguish minerals which have otherwise much resemblance. The cleavage of crystals is also important, a readiness to split in planes parallel to certain of their faces only, by which the *primitive form* of the crystal may be ascertained. Minerals not crystallised exhibit important varieties of *structure*, as *laminated*, *fibrous*, *granular*, &c. Certain peculiarities of *form* are also frequently characteristic of uncrystallised minerals, as *mamillary*, *botryoidal*, &c. Minerals exhibit, when broken, very different kinds of *fracture*, as *even*, *conchoidal*, *splintery*, &c. *Opaqueness*, *translucency*, and *transparency*, are more or less characteristic of different kinds: *electric* and *magnetic* properties demand attention; and very important characters are derived from *lustre*, which in some minerals is *metallic*, in others *semi-metallic*, in others *pearly*, *vitreous*, &c. *Colour* is not generally of much importance, but in some minerals it is very characteristic. *Hardness* and *tenacity* are very important, and are of all various degrees. A few fluid, and even a few gaseous substances, are included in mineralogical systems. *Unctuousity* and other peculiarities to be ascertained by the touch, are very characteristic of some minerals; peculiarities of *taste* and *smell* belong to others.

Mineralogy has very important relations with

geology, which cannot be studied without regard to the mineral constituents of rocks. The mineral composition of soils greatly affects vegetation and agriculture. The economical uses of minerals are also very important and various. It is enough merely to allude to coal, lime, salt, and the metallic ores. Naphtha, petroleum, bitumen, asphalt, &c. are of well-known utility; and a high value has always been attached to gems and other ornamental stones.

MINERVA, the name of a Roman goddess, identified by the later Græcising Romans with the Greek *Athene*, whom she greatly resembled, though, like all the old Latin divinities, there was nothing anthropomorphic in what was told concerning her. Her name is thought to spring from the same root as *mens* (the mind) and *monère* (to warn or advise); and the ancient Latin scholar and critic, Varro, regarded her as the impersonation of divine thought—the plan of the material universe of which Jupiter

was the creator, and Juno the representative. Hence all that goes on among men, all that constitutes the development of human destiny (which is but the expression of the divine idea or intention), is under her care. She is the patroness of arts and trades, and was invoked alike by poets, painters, teachers, physicians, and all kinds of craftsmen. She also guides heroes in war; and, in fact, every wise idea, every bold act, and every useful design, owes something to the high inspiration of this virgin goddess. Her oldest temple at Rome was that on the Capitol, but she had another on the Aventine. Her festival was held in March, and lasted five days, from the 19th to the 23d inclusive.

ATHENE, or PALLAS ATHENE, the Greek goddess corresponding, as we have said, to the Roman Minerva, was one of the few truly grand ethical divinities of Greek mythology. Different accounts are given of her origin and parentage, probably from the jumbling together of local legends; but the best known, and in ancient times, the most orthodox version of the myth represented her as the daughter of Zeus and Metis. Zeus, we are told, when he had attained supreme power after his victory over the Titans, chose for his first wife Metis (Wisdom); but being advised by both Uranus and Gæa (Heaven and Earth), he swallowed her, when she was pregnant with Athene. When the time came that Athene should have been born, Zeus felt great pains in his head, and caused Hephæstus (Vulcan) to split it up with an axe, when the goddess sprang forth—fully armed, according to the later stories. Throwing aside the thick veil of anthropomorphism which conceals the significance of the myth, we may see in the account of Athene's parentage an effort to set forth a divine symbol of the combination of power and wisdom. Her father was the greatest, her mother the wisest of the gods. She is literally born of both, and so their qualities harmoniously blend in her. It is possible that the constant representation of her as a strictly maiden goddess, who had a veil, and not a merely prudish antipathy to marriage, was meant to indicate that qualities like hers could not be mated, and that, because she was perfect, she was doomed to virginity. She was not, however, a cold unfeeling divinity; on the contrary, she warmly and actively interested herself in the affairs of both gods and men. She sat at the right

Minerva:

British Museum.

## MINERVINO—MINES.

of Zeus, assisting him with her counsels; helped him in his wars, and conquered Pallas Encelados in the battles of the giants. She the patroness of agriculture, invented the plough and rake, introduced the olive into Attica, (in harmony with her character as the personification of active wisdom) taught men the use of almost all the implements of industry and art; is said to have devised nearly all feminine employments. Philosophy, poetry, and oratory are also under her care. She was the protectress of the Athenian state, was believed to have instituted the court of justice on Mars' Hill (the Areopagus). As a warlike divinity, she was thought to approve of those wars only which were undertaken for the public good, and conducted with justice; and thus she was regarded as the protectress in battle of those heroes who were distinguished as well for their wisdom as their valor. In the Trojan wars, she favoured the Greeks—who, in point of fact, were in the right. Her worship was universal in Greece, and representations of her in statues, busts, coins, reliefs, vase-paintings were and are numerous. She is usually dressed, generally in a Spartan tunic, with a spear over it, and wears a helmet, beautifully adorned with figures of different animals, the ægis, a round Argolic shield, a lance, &c. Her countenance is beautiful, earnest, and thoughtful, and her figure majestic.

**MINERVINO**, a town of the Neapolitan province of Bari, called the *Balcony of Puglia*, from the fine view it commands of several cities. It is on a fine hill, and enjoys excellent air. Pop.

**MINES**, in Law. In England and Ireland, the owner has the right to all mines of gold and silver; where these metals are found in mines of tin, copper, iron, or other baser metal, then the crown alone has the right to take the ore at a price fixed by statute. As a general rule, whoever is the owner of the surface of the land, has a right to all the mines underneath the surface, for his absolute ownership extends to the centre of the earth. When the land is given by lease or otherwise to a tenant for life, while a third party has the reversion, then the tenant for life is entitled not to open mines which have not before been opened, but to carry on such as have been open, and are going mines. So in the case of a lease of lands for agricultural purposes, nothing is said as to mines, the tenant is not entitled to open any mines, for that would be coming waste. It is not uncommon for one person to be the owner of the surface of the land, and another to be the owner of the mines beneath; or several persons may be owners of different kinds of mines lying under the same surface in different strata. Many disputes have been raised lately between railway companies and mine-owners as to their respective rights and liabilities. When a railway passes through a mining country, it is generally optional with the owner to sell to the company merely the surface of the lands, reserving to himself the mines beneath; and it is usually provided that, if the owner works his mines so near to the railway as to endanger its stability, the company have notice of that fact, and then, if necessary, may purchase the mines immediately under the railway. But the courts have determined that even if the owner of the land reserve his right to work the mines, he is nevertheless prevented, by common law, from working the mines immediately under the railway, so as to endanger the use of the railway. In these matters the law of Scotland does not all differ, though, as to other points of the

common law, some differences of no great importance occur. See Paterson's *Compendium of English and Scottish Law*.

The practical working of mines and collieries in any part of Great Britain has been controlled by certain recent acts of parliament, with a view to insure the greater safety of the persons working them, and to prevent the employment of women and children. Thus, the owners of mines are prohibited, by the 35 and 36 Vict. cc. 76, 77, from employing any female whatever in any underground operation. Moreover, boys under 10 years of age cannot be lawfully employed, under a penalty to be incurred by the owner of £20. No proprietor or worker of a mine or colliery is allowed to pay the wages of the men at any tavern, public-house, beer-shop, or place of entertainment, or any office or outhouse connected therewith. No person under the age of 18 is to be employed at the entrance of any mine, to have charge of the steam-engine or windlass, or other machinery and tackle for letting down and bringing up the men. Inspectors are appointed by government for the express purpose of visiting mines, and seeing that the statutes are complied with. The statutes in question now apply not only to coal-mines and collieries, but to metalliferous mines of all kinds. Whenever an inspector, on examination, finds anything dangerous or defective in the mine, he is bound to give notice, to the owner, so that it may be amended. In case of accidents occurring in the mine, caused by explosion, and resulting in loss of life or bodily injury, the owner is bound, within twenty-four hours thereafter, to send notice to the Secretary of State, and to the district inspector of mines, specifying the probable cause of the accident.

**MINES, MILITARY**, constitute at once one of the most important departments in military engineering, and a very formidable accessory both in the attack and defence of fortresses. A military mine consists of a gallery of greater or less length, run from some point of safety under an opposing work, or under an area over which an attacking force must pass, and terminating in a chamber which, being stored with gunpowder, can be exploded at the critical moment. Mines are of great use to the besiegers in the overthrow of ramparts and formation of a breach; the *countermines* of the besieged in undermining the glacis over which the assaulting column must charge, and blowing them into the air, or in destroying batteries erected for breaching, are equally serviceable. But far above the actual mischief wrought by the mine—often very great—is its moral influence on the troops, and especially on the assailants. The bravest soldiers, who advance without flinching to the very mouth of the cannon which they see, will hesitate to cross ground which they suppose to be undermined, and on which they may be dashed to destruction in a moment, without the power of averting the *unseen* danger. The first employment of mines was very ancient, and merely consisted in obtaining an entrance to the interior of towns by passing beneath the defences; but this soon fell into disuse, the chances of success being merely those of introducing a body of men before the besieged discovered the mine. The next use occurred during the middle ages, and was more destructive. The miners went no further than beneath the wall, then diverged to either side, and undermined the wall, say for about 100 feet. During the process, the wall was sustained by timber-props; and these being ultimately set on fire, the wall fell; and the besiegers, who had awaited the opportunity, rushed in at the breach. This use of mines of *attack* necessitated those of *defence*, which obtained in mediæval times, and have ever since kept, the

name of 'countermines.' The earliest subterranean defence consisted of a gallery surrounding the fort in advance of the foot of the wall, and termed an 'envelope-gallery.' From this the garrison would push forward small branches or tributary galleries, whence they could obtain warning of the approach of hostile miners, and by which they succeeded, at times, in overthrowing the battering-rams or towers of the besiegers.

Two centuries appear to have elapsed between the introduction of gunpowder into European warfare and its application to subterranean operations. The first instance of this occurred in 1503, at the siege of the Castello del' Uovo, in the Bay of Naples, which a French garrison had succeeded in holding for three years against the combined Spanish and Neapolitan forces. At length, a Spanish captain, Pedro Navarro, devised a gallery into the rock, which he stored with powder, whereof the explosion, hurling portions of the rock and many of the besieged into the sea, caused the immediate capture of the place. At once the use of mines of attack spread throughout Europe; and so irresistible were they soon considered, that it was not unusual for the besieger, after preparing his mine, to invite the besieged to inspect it, with the view of inducing the latter at once to surrender. Defence soon availed itself of the new power, and retaining the envelope-gallery as a base, ran small countermines in many directions, to ascertain by hearing the approach of the enemy's sappers—his work being audible, to a practised ear, at a horizontal distance of 60 feet. Small charges were then exploded, which, without creating surface disturbance, blew in the approaching gallery, and buried the sappers in its ruins. Thus commenced a system of subterranean warfare, requiring the greatest risk and courage, in which the operator was in constant danger of being suffocated. Of course, in such a system, the balance of advantage lay with the besieged, who had ample opportunities, before the siege commenced, of completing his ramifications in every direction, and, if desirable, of revetting them with masonry, which much diminished the chance of being blown in; while the assailant, no longer able to cross the glacis by an open zigzag trench, was compelled to engage in a most uncertain subterranean advance. The French engineer Belidor, in the 18th c., restored the advantage to the attack, by demonstrating that the explosion of a very large mass of powder in a mine which had not yet entered the labyrinth of defensive mines, effected the destruction of the latter for a great space round, clearing the way with certainty for the hostile advance. Although the primary purpose of a mine is the explosion of a charge of powder, they are often used as a means of communication between different works, or between different parts of the same work, some being constructed of size sufficient to permit the passage of four men abreast, of horses, and of artillery.

It is, of course, impossible, in such a work as this, to give even an outline of the professional part of military mining; but the article would be incomplete without some allusion to the main principles.

Mines are either vertical—when they are called *shafts*—horizontal, or inclined, in either of which cases, they are 'galleries,' the word 'ascending' or 'descending' being added, if there be inclination. The dimensions range from the 'great gallery,' six feet six inches by seven feet, to the 'small branch'—the last diminutive of the gallery—which has but two feet six inches height, with a breadth of two feet. The most frequent work is the 'common gallery,' four feet six inches by three feet, which is considered the easiest for the miner.

The sapper's tools are numerous, but most in

request are his shovel, pickaxe, and above all, his 'push-pick' (see fig. 1); he has besides a barrow, a small wagon, a lamp, and other accessories. As he advances, it is necessary to line his gallery, always at the top, and almost always at the sides. This he does either by frames—which resemble door-frames, and serve to retain horizontal planks or 'sheeting' in position against the earth—or by cases somewhat resembling packing-cases, of little depth, which are used to form the sides and top. With cases,

galleries are supposed to Length, 1 foot 10 inches advance one foot and a half per hour; while with frames, the progress is barely more than half that amount.

When a mine is exploded, the circular opening on the surface is called the *crater*; the *line of least resistance* is the perpendicular from the charge to the surface; the half-diameter of the crater is its radius; and the *radius of explosion* is a line from the charge to the edge of the crater, or the hypotenuse of the triangle, the revolution of which would form the cone. When the diameter equals the line of least resistance, the crater is called a one-lined crater; when it doubles that line, a two-lined crater; and so on. The common mine

Fig. 2.—Mine supported by Frames, in process of construction from a Trench: A, trench; B, descending gallery; C, gallery; a, railing placed not yet pushed out to its full length.

for ordinary operations is the two-lined crater; and for this the charge of powder should—in ground of average weight and tenacity—be in pounds a number equal to one-tenth of the cube of the line of least resistance in feet; for example, at a depth of 18 feet, the charge should consist of 583 pounds. In sur-charged mines, or globes of compression, as introduced by Belidor, vastly greater charges are employed, and craters of six lines are sometimes produced. The rules, in these cases, for computing the charges vary exceedingly, according to different engineers, and in every case are very complicated. Previous to the explosion, the gallery is filled up behind the charge, or *tamped*, with earth, sand-bags, &c., to prevent the force of the powder wasting itself in the mine. This tamping must extend backwards for one and a half or twice the length of the line of least resistance. The mine is commonly fired by means of a powder-bow, composed of strong linen, enclosed in a wooden pipe laid carefully through the tamping, or by wires from a voltaic battery.

In the annexed figure (fig. 3), is shewn a system of countermines. The magistral gallery, AAA, is immediately within the wall of the countermines, through orifices in which it derives light and air, and by its loopholes, the defenders can take in rear any enemy who might obtain momentary possession of the ditch. Further in advance, as

should not be more than about 54 feet. Besides listening, they are used for aggressive purposes, such as driving branches and blowing hostile works. Modern engineers object to envelope-gallery, as affording too good a base enemy, should he obtain possession of it; her dispense with it altogether, or merely it in short sections. At suitable points the mines, small magazines for tools and are formed; and at about every 30 yards, doors of great strength are made, to stop ance of an enemy, should he break into the course of their excavations, hostile miners ly meet, or approach within a few feet. nes, then, merely a question of time which stroy the other; shells, pistols, pikes, and as well as small mines, being used with us effect.

sion is made for pumping foul air out of but such military works are in general entilated.

GHETTI, CAVALIERE MARCO, a distin- Italian writer and statesman, and for a ine minister of Italy, was born at Bologna, 8th November 1818. He belonged to an commercial family, and on the termination studies, entered on an extensive continental th the object of closely investigating the polical, and economical institutions of France, y, and more especially of Britain. On his from travelling, he published his maiden culcating the great commercial advantages trade, as existing in England, and espous- a warmth the economical views of Richard

In 1846, M. opened his political career by a journal of liberal tendencies, soon after ent of Pius IX. to power; in 1847, he was member of the *Consulta delle Finanze*, and became minister of public works. Having lost faith in papal progression, M. withdrew see, and joined the army of Charles Albert ardy, where he was warmly received by the d appointed captain. After the battle of e was promoted major; and for his bravery ngagement of Custoza, he received from the e cross of the Knights of St Maurizio. On clusion of the war, M. resumed his study of economy, and gained the confidence of y whom he was consulted during the ces of Paris. He subsequently became

secretary for foreign affairs, and only resigned with Cavour on the peace of Villafranca. M. became minister of the interior in 1860, and premier in 1863. After leaving the ministry, he went as ambassador to London in 1868, and was subsequently, for a short time, minister of agriculture. In 1872, he was appointed to report on the finances. His chief work is *Della Economia pubblica e delle sue Attinenze con la morale, e Col diritto* (1859).

MINHO. See ENTRE DOURO E MINHO.

MINHO (Span. *Miño*, anc. *Minius*), a river of Spain and Portugal, rises in the north-east of Galicia, in lat. about 43° 20' N., long. about 7° 15' W. Its course is south-west through the modern Spanish provinces of Lugo and Orense, after which, continuing its course, and forming the northern boundary of the Portuguese province of Minho, it falls into the Atlantic Ocean. Its length, exclusive of windings, is 130 miles, and it is navigable for small craft 23 miles above its mouth.

MINIATURE-PAINTING, or the painting of portraits on a small scale, originated in the practice of embellishing manuscript books. See MANUSCRIPTS, ILLUMINATION OF. As the initial letters were written with red lead (Lat. *minium*), the art of illumination was expressed by the Low Lat. verb *miniare*, and the term *miniatura* was applied to the small pictures introduced. After the invention of printing and engraving, this delicate art entered on a new phase; copies, in small dimensions, of celebrated pictures came to be in considerable request, and, in particular, there arose such a demand for miniature-portraits, that a miniature, in popular language, is held to signify 'a very small portrait.' Soon after their introduction, miniature-portraits were executed with very great skill in England. Holbein (b. 1498, d. 1554) painted exquisite miniatures, and having settled in London, his works had great influence in calling forth native talent. The works of Nicholas Hilliard (b. at Exeter 1547, d. 1619) are justly held in high estimation. Isaac Oliver (b. 1556, d. 1617) was employed by Queen Elizabeth and most of the distinguished characters of the time; his works are remarkable for careful and elaborate execution; and his son, Peter Oliver, achieved even a higher reputation. Thomas Flatman (b. 1633, d. 1688) painted good miniatures. Samuel Cooper (b. London 1609, d. 1672), who was, with his brother Alexander, a pupil of his uncle, Hoskins, an artist of reputation, carried miniature-painting to high excellence. Cromwell and Milton sat to him—he was employed by Charles II.—and obtained the highest patronage at the courts of France and in Holland. Till within these few years, miniature-painting continued to be successfully cultivated in Britain; but it has received a severe check since photography was invented, and most of the artists of the present time, who exercised their talents in this exquisite art, have left it for other branches of painting. As to technical details, the early artists painted on vellum, and used body-colours, that is, colours mixed with white or other opaque pigments, and this practice was continued till a comparatively late period, when thin leaves of ivory, fixed on card-board with gum, were substituted. Many of the old miniature-painters worked with oil-colours on small plates of copper or silver. After ivory was substituted for vellum, transparent colours were employed on faces, hands, and other delicate portions of the picture, the opaque colours being only used in draperies and the like; but during the present century, in which the art has been brought to the highest excellence, the practice has been to execute the entire work, with the exception of the high lights in white drapery,

with transparent colours. In working, the general practice is to draw the picture very faintly and delicately with a sable hair-pencil, using a neutral tint composed of cobalt and burned sienna. The features are carefully made out in that way, and then the carnations, or flesh-tints, composed of pink, madder, and raw sienna, gradually introduced. The drapery and background should be freely washed in, and the whole work is then brought out by hatching, that is, by painting with lines or strokes, which the artist must accommodate to the forms, and which are diminished in size as the work progresses. Stippling, or dotting, was a method much employed, particularly in early times; but the latest masters of the art preferred hatching, and there are specimens by old masters, Perugino, for instance, executed in that manner.

MINIM, the name of one of the notes in modern music, the value of which is the half of a semibreve.

MINIMS (Lat. *Fratres Minimi*, Least Brethren), so called, in token of still greater humility, by contrast with the *Fratres Minores*, or Lesser Brethren of St Francis of Assisi (q. v.), an order of the Roman Catholic Church, founded by another St Francis, a native of Paula, a small town of Calabria, about the middle of the 15th century. Francis had, as a boy, entered the Franciscan order; but the austerities of that rule failed to satisfy his ardour, and on his return from a pilgrimage to Rome and Assisi, he founded, in 1453, an association of Hermits of St Francis, who first lived in separate cells, but eventually were united in the conventual life in 1474, and established in several places in Calabria and Sicily. Francis was also invited into France by Louis XI., and founded houses of his order at Amboise and at Plessis-les-Tours. In Spain, the brethren took the name of 'Fathers of Victory,' in memory of the recovery of Malaga from the Moors, which was ascribed to their prayers. It was not till very near the close of the life of Francis that he drew up the rule of his order. It is exceedingly austere, the brethren being debarred the use not only of meat, but of eggs, butter, cheese, and milk. Notwithstanding its severity, this institute attained considerable success; its houses, soon after the death of Francis (1502), numbering no fewer than 450. It has reckoned several distinguished scholars among its members; but in latter times, the order has fallen into decay, being now limited to a few houses in Italy, the chief of which is at Rome. The superiors of convents in this order are called by the curious name of *Corrector*, the general being styled *Generalis Corrector*. A corresponding order of females had its origin about the same time, but this order also has fallen into disuse.

MINING is a general term for the underground operations by which the various metals and other minerals are procured. It has been practised to some extent from the remotest times, as is proved by the reference to it in the 28th chapter of the book of Job. In its proper sense, the art was certainly known to the ancient Phœnicians and Egyptians, and also to the Greeks and Romans. Mining operations were carried on in Britain by the latter at the time of the Roman Conquest. After the Norman Conquest, Jews, and, at a later time, Germans were largely employed in our mines. The introduction of gunpowder as a blasting material in 1620, led the way to many improvements in mining; so also did the introduction of powerful engines for pumping water, about the beginning of the 18th c.

There are two principal methods of mining: one of which is adopted where the mineral occurs in veins or lodes, as copper and lead ore; and the other where the mineral occurs in more or less

parallel beds, as coal. Mining in alluvial deposits is a third method, largely practised in the regions of California and Australia, and including the novel process of 'hydraulic mining.'

In mines like those of Cornwall and Devon where most of the copper and tin of Great Britain and also some of the lead, are obtained, the mineral occurs in veins filling cracks or fissures in the rock. Such veins are termed lodes, to distinguish them from veins of quartz and other non-metallic minerals. Lodes are very irregular in size, and in the directions they take, though they usually follow a general line.

Fig. 1 shows a portion of a lode, where  $\alpha$  represents the main or 'champion' lode, and

Fig. 1.—Portion of a Lode or Mineral Vein.

branches, called *feeders*, *shoots*, and *strings*. Mineral veins sometimes extend for several miles through a country; but they expand and contract so as to split up into so many branches, that it is perhaps uncertain whether the same lode has been traced for more than a mile. Veins seldom deviate more than 45 degrees from a perpendicular line, and descend to unknown depths. They stratify like stratified and unstratified rocks. The veins which run east and west have been observed to be the most productive.

Fig. 2 shows a section of a Cornish mine, with the lodes  $l, l, l, l$ ;  $a$  is the engine-shaft, in which are the pumps and the ladders for ascent and descent;  $b, b$  are *whim-shafts* for raising the

Fig. 2.—Cross-section of a Cornish Mine.

which is done by means of buckets. The adit, or day-level, is a long passage to which the water from the mine is pumped up and conveyed away. Adits are made to traverse several miles. A great adit which drains the mines of Glengarnock, in Cornwall, is 30 miles long. At different points, cross cuts, by which the workings of different lodes are connected.

# MINING.

the horizontal galleries, termed *levels*, *a*, are driven upon the lode, and some of the upright shafts, called *winces*, *b*. Levels are

Fig. 3.

about ten fathoms (60 feet) apart. They are driven perpendicular above each other, as low as the inclination of the vein. In the richer portions of the lode, termed *eyes*, are shewn shaded; and where these are removed, and their place filled with angular fragments are represented. This is done to prevent the sides of workings from falling in. The bottom of the engine shaft is the west portion of the mine. It is called the *adit*, and is the place where the water from the various levels and workings collects, in order to be pumped up to the adit. The galleries and shafts in an extensive mine are very numerous, and altogether a very complicated affair. They, however, have all distinct names, and are known by their depth in fathoms, and particular places are as easily found as in a town. The underground workings of the Consolidated Mines, which are the largest in the world, being a conjunction of four mines, are about 100 fathoms, or 63 miles, in extent. In working the lode between one level and another, the miner usually goes upwards, it being easier to descend than to raise it up. He works by the light of a candle, stuck with clay to the side of the mine. His tools are few—namely, a hammer, and some wedges where the vein is hard and friable; but it is generally hard enough to require blasting, in which case he uses a *borer* or *drill*, and some smaller tools for cleaning and enlarging the hole which is made. The ore is filled with gangue, and then drawn along the gallery to the shaft, to be raised to the surface in *kibbles*. The lode may be 30 or 40 feet thick, and so poor as not to be worth working; again, it may be a few inches thick, and yet its richness will repay the labour of extracting it. Three feet may be taken as the average of the thickness of veins. In extensive mines, portions of the lode are here and there left in the lode, so as to afford a steady supply when other parts are exhausted. These are called *eyes*, and when they are removed, the operation is termed *putting out the eyes of the mine*.

The old plan of ascending and descending the mine by ladders, so destructive to the health of the miners, is still largely in use. The ladders are about 25 feet long, and set with a slope.

There is a platform at the bottom of each called a *sollar*, with a man-hole in it leading to the next ladder beneath. Some of the Cornish mines are half a mile deep, so that it takes the miner an hour to reach the surface after he is done with his work; most of the journey being accomplished on wet, slippery ladders. The bad effects of the fatigue so produced is augmented by the fact that the men come from a constant temperature of 80° or 90° F. below, to one of perhaps 30° or 40° on the surface. Dr J. B. Sanderson states as the result of recent inquiries, that 90° F. is the highest limit of temperature consistent with healthy labour in a mine.

A great improvement on the ladder system is now in operation in several of the deep Cornish mines. It is a method first introduced into the deep mines of the Harz, and called the *Fahr-kunst*. The plan of this 'man-engine' is this. Two rods descend through the depth of the shaft, and upon these bracket-steps are fixed every 12 feet. The rods move up and down alternately through this distance by means of a reciprocating motion. Fig. 4 represents the arrangement when the rods are at rest. If the miner wishes to ascend, he places himself on the step *a* of the rod *A*, and is raised by the first movement of this rod to the level of *b'* on the rod *B* (see fig. 5), to which he now

Fig. 4.

Fig. 5.

Fig. 6.

Diagrams to illustrate 'Man-engine.'

crosses. The next movement raises the rod *B*, and brings the step *b'* up to the level of *c* on *A* (fig. 6), to which he next crosses; and so, ascending stage by stage, he reaches the top. The descent is, of course, accomplished in the same way.

Some of the Cornish pumping-engines are very large and powerful. The cylinder of one of the largest is 7 feet 6 inches in diameter. With the expenditure of one bushel of coal, it can raise 100,000,000 lbs. weight one foot high; this is called its 'duty.' It lifts nearly 800 gallons of water per minute, and its cost was about £8000.

In Cornwall, the miners are divided into two classes: one of them called *tributers*, who take a two months' contract of a portion of the lode; the other called *tutmen*, who are employed in sinking shafts, driving levels, &c.

A detailed analysis of one of the largest Cornish copper mines, published some years ago, shews that in that year it produced, in round numbers, 16,000 tons of ore, realising £90,000, and yielding a net profit of about £16,000. It employed about 700 miners, 300 labourers, 300 boys, and 300 women and girls. The cost for coal was £1800; for malleable iron and steel, £1300; for foundry castings, £2000; for ropes, £1000; for candles, £1800; for gunpowder, £2000; and for timber, nearly £3000. The

last Metalliferous and Coal-mines Regulation Acts were passed in 1872. See MINES IN LAW.

**Mining for Coal.**—The minerals of the carboniferous formation, at least those which occur in beds or strata, as coal and clay ironstone, are mined, as has been already said, in a different way from metallic veins. Originally deposited in a horizontal position, they have been so altered by movements in the earth's crust, that they are rarely found so now. They are more generally found lying in a kind of basin or trough, with many minor undulations and dislocations. But however much twisted out of their original position, the different seams, more or less, preserve their parallelism, a fact of great service to the miner, since beds of shale, or other minerals, of a known distance from a coal-seam, are often exposed when the coal itself is not, and so indicate where it may be found.

The great progress made of late years in the science of geology has made us so minutely acquainted with all the rock formations above and below the coal-measures, that it is now a comparatively easy matter to determine whether, in any given spot, coal may or may not be found. Nevertheless, large sums are still occasionally, as they have in past times been very frequently, wasted in the fruitless search for coal, where the character of the rocks indicates formations far removed from coal-bearing strata.

When there are good grounds for supposing that coal is likely to be found in any particular locality, before a pit is sunk, the preliminary process of 'Boring' (q. v.) is resorted to, in order to determine whether it actually does exist there, and if in quantity sufficient to make the mining of it profitable. The usual mode of 'winning' or reaching the coal is to sink a perpendicular shaft as at *a*, fig. 7; but sometimes a level or cross-cut mine *b*,

Fig. 7.—Diagram shewing methods of 'winning' the Coal.

and at other times, an inclined plane or 'dook' *c*, is adopted. Before the introduction of pumping-engines, all coal-workings were drained by means of a level mine (*b*) called a *day-level*, driven from the lowest available point on the surface, and no coal could be wrought at a lower depth than this, because there were no means of removing the water.

When the shaft has been sunk to the necessary depth, a level passage, called the *dip-head*, or *main-level*, is first driven on each side, which acts as a roadway or passage, and, at the same time, as a drain to conduct the water, which accumulates in the workings, by means of a gutter on one side, to the lodgment at the bottom of the shaft. This level is the lowest limit of the workings in the direction of the dip, and from it the coal is worked out as far as is practicable along the rise of the strata. There are two principal methods of mining the coal. One is termed the 'post-and-stall' or 'stoop-and-room' system, and is used for thick seams; the other is called the 'long-wall' system, and is adopted for seams under four feet in thickness.

Fig. 8 represents a portion of a mine wrought on the post-and-stall plan, where the coal is taken out in parallel spaces of say 15 feet wide, intersected by a similar series of passages at right angles. Between these 'rooms,' as they are called, 'stoops' of coal, about 30 feet each

way, are left for the support of the 'roof' seam. Larger stoops are left at the bottom

Fig. 8.—Plan of part of a Coal Mine, shewing 'stoop-and-room' Workings.

shaft, in order to secure greater stability. There is a modification of this plan adopted at Newcastle, called the 'board-and-pillar' method, in which a certain number of the stoops or pillars are removed altogether, after which the roof falls and forms a mass of ruins, termed a 'goaf.'

The *long-wall* system consists in extracting the entire seam of coal at the first working, the lying strata being supported by the waste rock at the roof of the workings. It is necessary, however, to leave large stoops at the bottom of the shaft for its support, as in the stoop-and-room method. long-wall workings, roads of a proper height and width require to be made for communication between the different parts of the mine.

The collier's usual mode of extracting the coal from its bed is this: With a light pick, he undercuts the coal-seam, technically termed 'holing' it, for three feet inwards, and then, by driving in a wedge at the top of the seam, he breaks away the coal which has been holed. Blasting is occasionally not often resorted to. For the purpose of cutting machines, some for 'holing' only, and some for both 'holing' and hewing down coal—have been more or less in use. They usually work by compressed air, but sometimes with steam. It is still premature, however, to express any opinion as to their efficiency as compared with manual labour. The coal, when separated from the rock, is put on tubs or hutches, which are generally drawn by horses, but sometimes by engine-power, to the roads to the bottom of the shaft, and then to the surface.

The shaft is perhaps the most important part of a coal-pit, and the principal parts of one are shewn in fig. 9. The upper part shows the pit-head arrangements, the central part shows the force-pump, &c., and the lower part shows the pit-bottom arrangements. To make this complete, the reader must imagine a great number of partitions at the gaps *A* and *B*. The four divisions in this shaft: the two central ones, *a*, *a*, are used for sending up and down the coal; the one on the right side, *b*, contains the pumps; and the remaining one on the left, *c*, for withdrawing the vitiated air from the mine. It has usually a furnace at the bottom of it. In pits a special shaft is applied to the ventilation, which mechanical contrivances, such as ventilating fans, are now also partially introduced. So dreadful an accident at the Hartley Colliery, in 1862, caused by the beam of the engine breaking and closing up the shaft, an act of parliament has since passed making it imperative to have two, or at least two outlets, to every coal-mine, as a means of escape, in case of an accident to one of the

# MINING—MINISTER.

ges *d, d*, by which the colliers ascend and are also used for raising the coal. They

A

B

square plats of timber, with rails across the convenience of running off and on the bes, *e*, and with a light iron frame, by ey are suspended to a flat wire-rope. On there are iron clasps, which slide up and guide-rods. In the figure, two miners are anding on one cage at the bottom of the l the other is at the top, with a coal-hutch. The accidents resulting from the raising ring of the cages are numerous; many of pen by the carelessness of the engine-man pping the cage when it reaches the mouth, and so allowing it to be upset by over- Many accidents also happen from the king. To prevent this, numerous 'safety-ve been invented, most of which depend tion of a spring, which is held in a certain while the cage is suspended by the rope; d the latter snap, the spring is suddenly and then grasping the guide-rods, prevents from falling. Other safety cages act by d clutches, but it is still disputed whether

there is, on the whole, a decided advantage in using any of them, since they are all liable to get out of order. The man-engine shewn in figs. 4, 5, and 6, although not used in British collieries, is adopted in several on the continent, and is certainly the safest way of putting up and down men in a pit.

The steam-engine, *E*, works the pumps, in this case by a direct action, the pump-rods being attached to the piston-rod. The engine also winds up the cages, one of which ascends while the other descends—the barrel and other arrangements for which are shewn in the figure.

The proper ventilation of any mine, but especially of a coal-mine, is of very great importance. It clears the mine of the dangerous gases, fire-damp and foul-damp, dries the subterranean roadways, and furnishes the miners with a supply of pure air. Some idea of the general mode of ventilating a mine will be obtained by referring to fig. 9, where the arrows pointing downwards indicate the *down-cast* shaft, and the arrows pointing upwards, the *upcast* one; and to the plan, fig. 8, where the atmospheric air, entering by the downcast shaft, passes along the roadways, as indicated by arrows. A number of doors and stops secure the travelling of the current in a proper direction, so as to reach the furthest recesses of the mine. It then returns by the upcast shaft, where, as has been already stated, it is usual to keep a furnace burning, to aid in withdrawing the impure air. It is very difficult, however, to secure efficient ventilation through all the zigzag windings of a mine; hence the frequent, and sometimes terrible explosions of fire-damp, or light carburetted hydrogen, which explodes when mixed with a certain proportion of atmospheric air; hence, also, the occasional accumulation of foul-damp (carbonic acid) in some pits, which suffocates any one breathing it. This deadly gas is always produced in large quantity by an explosion of fire-damp, and chokes many who have survived the violence of the explosion. Many collieries are so free of fire-damp, that the miners work with naked lights, but in others it is necessary to use the Safety Lamp (*q. v.*).

Besides the already mentioned sources of accident, there is the sudden falling-in of pieces from the roof of the workings. The following summary, made up from H.M. inspector's returns for ten years, shews the number of lives lost, in proportion to the quantity of coal raised:

Total tons of coal raised in Great Britain for the ten years ending 1872,	921,713,633
Total number of lives lost in ditto,	10,685
Average tons of coal raised to each life lost,	86,262

To shew the magnitude of some of the large coal-mines, it may be stated that the Hetton Colliery, in Durham, yields 800,000 tons in the year, employs about 1000 men and 300 boys underground, and 300 people at the surface. The Monkwearmouth pit, near Newcastle, is 1900 feet deep, and its face-workings are two miles from the bottom of the shaft. Rosebridge Colliery, near Wigan, has the deepest shaft in England, being nearly 2500 feet deep. The sinking of some of the more difficult shafts has cost from £50,000 to £100,000 each.

MINISTER, a public functionary who has the chief direction of any department in a state. See MINISTRY. Also the delegate or representative of a sovereign at a foreign court to treat of affairs of state. Every independent state has a right to send public ministers to, and receive them from, any other sovereign state with which it desires to preserve relations of amity. Semi-sovereign states have generally been considered not to possess the *jus legationis*, unless when delegated to them by the state on which they are dependent. The right

## MINISTER—MINISTRY.

confederated states to send public ministers to each other, or to foreign states, depends on the nature and constitution of the union by which they are bound together. The constitution of the United Provinces of the Low Countries and of the old German Empire preserved this right to the individual states or princes, as do the present constitutions of the German Empire and Swiss Confederation. The constitution of the United States either greatly modifies or entirely takes away the *jus legationis* of each individual state. Every sovereign state has a right to receive public ministers from other powers, unless where obligations to the contrary have been entered into by treaty. The diplomatic usage of Europe recognises three orders of ministers. Ministers of the first order possess the representative character in the highest degree, representing the state or sovereign sending them not only in the particular affairs with which they are charged, but in other matters: they may claim the same honours as would belong to their constituent, if present. This first class of diplomatic agents includes papal legates and nuncios, and ambassadors ordinary and extraordinary. A principle of reciprocity is recognised in the class of diplomatic agents sent. States enjoying the honours of royalty send to each other ministers of the first class; so also in some cases do those states which do not enjoy them; but it is said that no state enjoying such honours can receive ministers of the first class from those who are not possessed of them.

Ministers of the second and third order have not the same strictly representative character; their representation is not held to go beyond the affairs with which they are charged. They are, however, the natural protectors of the subjects of the state or country sending them in the country to which they are sent. Ministers of the second class include envoys, whether these are simply so styled, or denominated envoys extraordinary, and also ministers plenipotentiary. The third class of ministers does not differ from the second in the degree of their representative character, but only in the diversity of their dignity, and the ceremonial with which they are received. This class comprehends ministers, ministers resident, ministers chargés d'affaires, such consuls as are possessed of a diplomatic character, and those chargés d'affaires who are sent to courts to which it is not wished to send agents with the title of minister. Ministers of the third class have, for the most part, no letters-credential from the sovereign, and are accredited only by letters to the foreign minister or secretary of the country to which they are sent.

Besides these orders of ministers, there are other diplomatic agents occasionally recognised—as deputies sent to a congress or confederacy of states, and commissioners sent to settle territorial limits or disputes concerning jurisdiction. These are generally considered to enjoy the privileges of ministers of the second and third order. Ministers-mediators are ministers sent by two powers, between which a dispute has arisen, to a foreign court, or congress, where a third power, or several powers, have, with the consent of the two powers at variance, offered to mediate between them.

Diplomatic agents, except, as already mentioned, those of the third class, are accredited by a letter to the sovereign of the country to which they are sent. The letter of credence is usually despatched under a *cachet volant*—i. e., a seal which does not close the letter; or else, in addition to the principal letter, an authenticated copy is sent, which the diplomatic agent on his arrival presents to the Minister or Secretary for Foreign Affairs, as his right to demand an audience of the sovereign; the original is pre-

sented to the sovereign. 'Ministers sent to a congress or diet have usually no credentials, but merely a full power, of which an authenticated copy is delivered into the hands of a directing minister, or minister-mediator. A minister of the first class is received to both public and private audiences by the sovereign to whom he is accredited; a minister of the second class generally to private audiences only. Diplomatic agents are entitled to conduct negotiations either directly with the sovereign, or with the minister or secretary for foreign affairs. The latter course is the more usual, and generally the more convenient.

The title 'Excellency' has, since the peace of Westphalia, been accorded to all diplomatic agents of the first class; and in some courts it is extended to ministers of the second class, or at least those sent by the great powers. See AMBASSADOR, ENVOY, CONSUL. Under AMBASSADOR, the immunities and privileges enjoyed by diplomatic agents are explained.

MINISTRY, the body of ministers of state, or persons to whom the sovereign or chief magistrate of a country commits the executive government.

It is a principle of the constitution of Great Britain, that 'the king can do no wrong'; that is to say, the sovereign personally is irresponsible for his acts, the real responsibility resting with the administrative government. The 'King's Council,' or PRIVY COUNCIL, were the earliest advisers of the sovereign in matters of state; but when this body came, a course of time, to be found too large for the dispatch of business, its duties were transferred to a small committee of privy councillors selected by the king. As late as in Charles I.'s time, all the more important resolutions of the crown were taken after deliberation and assent of the Privy Council. An unsuccessful attempt was made in the reign of Charles II. to restore the council to its original functions. Its numbers were limited to thirty; and it was intended that this limited council should have the control of the whole executive administration, superseding any interior cabinet. But the council was found too extensive for an effectively working ministry, and the former arrangement was restored. The CABINET or MINISTRY is now but a committee of the Privy Council; and its exclusive right to discuss and determine the plans and business of the government has been often said not to be recognised by the law, a position which, however, was disputed by Lord Campbell, who maintained that, 'by our constitution, it is in practice a defined and acknowledged body for carrying on the executive government of the country.' Proclamations and orders still issue from the Privy Council; and it is occasionally assembled to deliberate on public affairs, when only those councillors who are summoned attend. The cabinet is a merely deliberative body; its members collectively have no power to issue warrants or proclamations; but all important measures which engage the attention of the government, whether regarding matters domestic, foreign, or colonial, and all plans of action, whether purely administrative, or to be carried out in parliament, must be proposed, considered, and adopted by the cabinet. The sovereign intrusts the formation of a ministry to a statesman, who selects for the members of his cabinet those who are attached to his political views. He generally places himself at the head of the government as First Lord of the Treasury, and in popular language, he is called the Premier, or Prime Minister. The Lord Chancellor, the Chancellor of the Exchequer, the Secretaries of State for Home, Foreign, Colonial, and Indian affairs, the Secretary at War, and the President of the Council, are necessarily members of the cabinet; and with them are associated the heads of various other important

## MINISTRY—MINNESINGERS.

ts of government, including generally the l of the Admiralty, the President of the Trade, the Postmaster-general, the Presi- the Poor-law Board, the Chancellor of of Lancaster, and occasionally the Chief for Ireland. The Premier has sometimes fice of Chancellor of the Exchequer in n with that of First Lord of the Treasury. uncillor of great political weight is some- into the cabinet without office, and post of Lord Privy Seal. Her Majesty's include the following, who have usually i the cabinet: the Chief Secretary for e First Commissioner of Works, the Vice- of the Board of Trade, the Vice-president mmittee on Education, the Commander- e Lord Chamberlain, the Steward, the the Horse, the Master of the Buckhounds, roller of the Household, the Lord Lieu- Ireland, the Attorney-general and Solic- of England, the Lord Advocate and neral of Scotland, and the Attorney- l Solicitor-general of Ireland. Occasion- ceptionally, the Commander-in-chief, and Chief Justice of England, have been mem- cabinet. A ministry is often spoken of atry of the person who is at its head.

s of the cabinet are held on the summons of its members, usually at the Foreign s proceedings are secret and confidential, ord is kept of its resolutions, which are o effect by those of its members to whose s they severally belong. As the acts of are at all times liable to be called in a parliament, it is necessary that the e chief departments should have seats in e, in order to be able, when required, to t explanations.

ment exists only so long as it can com- onfidence of parliament. The sovereign ver to dismiss his ministers whenever to possess his confidence, but such a uld be useless without the support of of Commons, who, by withholding their uld paralyse all the functions of govern- sovereign has sometimes got rid of a ith whose policy he was dissatisfied, by arliament, and appealing to the country. inistry cannot command the confidence nt, they resign, and a statesman of some ical party is sent for by the sovereign, ised to form a new cabinet. All the of a ministry filling political offices g with it, as also the great officers of and those officers of the royal household ats in either house of parliament. Some- s holding lucrative appointments which essitate resignation, have retired, as a on of adherence to their political friends. s to the ministers already named, the herents of the ministry go out of office s of government: the three junior Lords ury, the two Secretaries of the Treasury, rliamentary Under-secretaries of State, ster-general, the Master-general of the the Surveyor-general of the Ordnance, nior Lords of the Admiralty, the first f the Admiralty, the Chief Commissioner ch Hospital, the President and Parlia- ecretary of the Poor-law Board, the f the Board of Health, the Vice-cham- Captain of the Gentlemen-at-arms, the the Yeomen of the Guard, the Lords in e Mistress of the Robes, the Treasurer usehold, the Chief Equerry, or Clerk he Judge Advocate-general, and the

Lord Chancellor for Ireland. The private secretary to a minister loses office on a change, his appoint- ment being a purely personal one; and some changes are generally, though not always made in ambassadors extraordinary.

In 1839, when Viscount Melbourne's ministry resigned, Sir Robert Peel, who was intrusted by the Queen with the formation of a new ministry, proposed that, in order to give public proof of her Majesty's confidence, the change should include the chief appointments held by the ladies of Her Majesty's household. The Queen, counselled by Lord Melbourne, refused her consent to this proposal, on the ground of its being contrary to the latest precedents of the reign of Queen Anne. Sir Robert, however (with whose opinion the Duke of Wellington expressed concurrence), considered the change a necessary one; and as he refused to under- take the formation of a government without its being adopted, the result was that Lord Melbourne and his colleagues were reinstated. At a council held on their resuming office, it was resolved, 'That for the purpose of giving to the administration the character of efficiency and stability, and those marks of the constitutional support of the crown that are requisite to enable it to act usefully to the public service, it is reasonable that the great officers of the court, and situations in the household held by members of parliament, should be included in the political arrangements made in a change of the administration. But they are not of opinion that a similar principle should be applied or extended to the offices held by ladies in Her Majesty's household.'

MINIUM (Lat. red-lead). See LEAD.

MINK. See WEASEL.

MI'NNÉSINGERS, a designation applied to the earliest lyric poets of Germany in the 12th and 13th centuries, and derived from the word *Minne*, or love, which was at first the predominating, and almost sole subject treated of in their produc- tions. The works of the M. are for the most part superior to those of their more generally known contemporaries, the troubadours, both in regard to delicacy of sentiment, elegance and variety of rhythmical structure, and grace of diction. Henry of Veldig, who flourished in the beginning of the 12th c. at the court of the Swabian, Frederick Barbarossa, Emperor of Germany, is regarded as the father of the M., and Walther von der Weide, who was born about 1170, as the last of this great vocal band, which included emperors, princes, nobles, and knights. Many of their productions have of course perished, although, in addition to a very large collection of poems by anonymous M., we still possess some remains of the songs of more than 150 known composers. Among the most celebrated of these, special notice is due to Wolfram von Eschenbach (q. v.), Henry von Ofterdingen, Hage- naue, Hartmann von der Aue (q. v.), Gottfried von Strasburg (q. v.), Otto von Botenlauben, Truchsess von St Gall, and Ulrich von Lichtenstein—men of noble houses, who, although they belonged to every part of Germany, wrote almost exclusively in the Swabian dialect, which, during the brilliant days of the Fredericks and Conrads of the House of Swabia, was the language of the court in Germany. Among the few other forms of German employed by the M., the one next in favour was the Thuringian, adopted in compliment to Hermann, Landgraf of Thuringia, who, next to the princes of the Swabian dynasty, was the most munificent patron of the M. during the period of their renown, in the early part of the 13th century. Besides songs in praise of women, the M. composed odes on public or private occasions of lament or joy, distiches or axioms, and *Wachlieder*,

or watch-songs, in which the lover was represented as expostulating with the watchman, who kept guard at the gate of the castle within which his lady-love was imprisoned, and trying to persuade him to grant him admittance to her presence. These songs and odes were recited by the composer, to his own accompaniment on the viol; and as few of the M. could write, their compositions were preserved mostly by verbal tradition only, and carried by wandering minstrels from castle to castle throughout Germany, and even beyond its borders. As the variety of rhythm and complicated forms of versification affected by the M., more especially towards the decline of their art, rendered it difficult to retain by memory the mass of Minnesong which had been gradually accumulated, these itinerant musicians finally made use of written collections, a practice to which alone we are indebted for the many beautiful specimens of early German lyrical poetry which we yet possess. The glory of the M. may be said to have perished with the downfall of the Swabian dynasty, under which greater liberty of thought and word was allowed among Germans than they again enjoyed for many ages; and in proportion as the church succeeded in re-asserting its sway over the minds of men, which it had lost under the rule of the chivalric Fredericks, freedom of speech and action was trammelled, and song and poetry condemned. Paraphrases of Scripture, hymns, and monkish legends, took the place of the chivalric songs of the nobly born M., and German poetry was for a time almost annihilated.

In the 14th c., the art of Minnesong was partially revived, although under a rude and clumsily elaborated form, by the *Master-singers*, a body of men belonging to the burgher and peasant classes, who, in accordance with their artisan habits, formed themselves into guilds or companies, which bound themselves to observe certain arbitrary laws of rhythm. Nuremberg was the focus of their guilds, which rapidly spread over the whole of Germany, and gained so firm a footing in the land, that the last of them was not dissolved at Ulm till 1839. As the title of Master was only awarded to a member who invented a new form of verse, and the companies consisted almost exclusively of uneducated persons of the working-classes, it may easily be conceived that extravagances and absurdities of every kind speedily formed a leading characteristic of their modes of versification; attention to quantity was, moreover, not deemed necessary, regard being had merely to the number of the syllables, and the relative position and order of the verses and rhymes. Their songs were lyrical, and sung to music; and although, as before remarked, each master was bound to devise a special *stole* or order of rhymes for each of his compositions, these stoles were subjected to a severe code of criticism, enacted by the *Tabulatur*, or rules of the song-schools. Among the few Masters who exhibited any genuine poetic feeling, the most noted were Heinrich Mügelin, Michael Behaim, and the Nuremberg shoemaker, Hans Sachs, who prided himself on having composed 4275 *Bar* or Master Songs. See Tieck's *Minnelieder aus dem Schwäbischen Zeitalter* (Berl. 1803), and Taylor's *Lays of the Minne and Master Singers* (Lond. 1825).

**MINNESOTA**, one of the United States of America, lies in lat. 43° 30'—49° N., and long. 89° 29'—97° 5' W. It is 380 miles in extreme length from north to south, and from 183 to 337 from east to west, containing an area of 81,259 square miles. It is bounded on the N. by the British possessions, from which it is separated by the chain of lakes and rivers connecting the Lake of the Woods with Lake Superior, and by the

49th parallel of latitude; E. by Lake Superior and Wisconsin; S. by Iowa; and W. by Dakota Territory (q. v.), from which it is partly divided by the Red River of the North. It contains 10 counties, and its chief towns are St Paul, the capital, St Anthony, Stillwater, Winona, Hastings, &c. M. contains the summit of the central table-land of the North American continent, where, within a few miles of each other, are the sources of rivers which find their outlets in Hudson's Bay, the Gulf of St Lawrence, and the Gulf of Mexico. The state is abundantly watered by the Mississippi, Minnesota, Red River of the North, Rainy Lake River, and their branches, and has more than 1500 miles of navigable rivers. The country abounds also in lakes and ponds. The sources of the great rivers are 1680 feet above the level of the sea. Though the most northerly state in the Union, M. is one of the most beautiful, fertile, and salubrious. The winters are long and cold, but equable, and the country is rich in fertile lands and forests. The clear waters are stored with fish, and game is abundant. The scenery is varied and beautiful. The Falls of St Anthony on the Mississippi afford abundant water-power. Near these is the beautiful cascade of the Minnehaha, or Laughing Water, 45 feet perpendicular, and a cavern, explored to the depth of 1000 feet. M. began to be settled in 1845, though it was explored by the French, and trading-posts established, in 1680. The chief route to the British settlements of the Red River of the North lies through Minnesota. The state has plenty of good timber, and is rich in minerals, including gold, iron, copper, coal, and lead. In 1870, its agricultural products were valued at \$33,446,400. In the same year it had 6 universities and colleges, and 2424 public schools. In January 1872, 1523 miles of railway were completed, and about 1000 more projected, towards which grants of land have been made to the extent of nearly \$4,500,000. Powerful Indian tribes occupy portions of the state. The state government was organized in 1858. Pop. in 1860, 172,023; in 1870, 432,766.

**MINNESOTA**, or **ST PETER'S RIVER**, rises near the eastern boundary of Dakota Territory, United States of America, runs south-east 300 miles, to South Bend, then north-east 120 miles, and falls into the Mississippi at Mendota. It is navigable for 40 miles by steam-boats.

**MINNOW** (*Leuciscus phoxinus*), a small fish of the same genus with the roach, dace, chub, &c., of a more rounded form than most of its congeners, a common native of streams with gravelly bottoms in most parts of Britain. It seldom exceeds three inches in length, the head and back of a dusky olive colour, the sides lighter and mottled, the belly white, or, in summer, pink. Minnows swim in shoals, feed readily either on animal or vegetable substances, if sufficiently soft, and are said to be very destructive to the spawn of salmon and of trout. Very young anglers generally begin their sport by catching minnow. The M. is a fish of very pleasant flavour. A casting-net affords the means of taking it in sufficient abundance. It is a favourite bait for pike and large trout or perch.

**MINOR**, a term used in Music. 1. Is the nomenclature of intervals. The interval between any note and another is named according to the number of degrees between them on the scale, both notes included. The interval between C and E is called a third; that between E and G is also a third; but these intervals are unequal, the one consisting of four semitones, the other of three; the former is therefore distinguished as a major, the latter as a minor interval. 2. The term is also

plied to one of the two modes in which a musical usage may be composed. The scale of the minor mode differs from that of the major mode in the third of its key-note being a minor instead of a major third. See MUSIC, MODE.

**MINOR** is, in Scotch Law, the term describing a person who, if a male, is between the ages of 14 and 21; and if a female, is between 12 and 21. In the preceding period, he or she is called a Pupil. In England, the technical term is an Infant (q. v.), which includes all persons, male and female, under the age of 21. In Scotland, a minor is for many purposes *sui juris*, and can marry without anybody's consent, and can also make a will of movable property. For the purposes, however, of managing his real property and making contracts, curators are often necessary. See INFANT, RESTITUTION, GUARDIAN.

**MINOR BARONS.** The word baron, in the earliest period of feudalism, signified one who held lands of a superior by military tenure. The superior might be the sovereign, or he might be an earl or other eminent person, who held of the sovereign, according as he was the one or the other, the baron was, in the earliest sense of the distinction, a greater or lesser baron. At the Conquest, a large part of the soil of England was parcelled by William the Conqueror among his military retainers, who were bound in return to perform services, to do homage, and to assist in administering justice, and in transacting the other business done in the court of the king. 400 of these tenants-in-chief of the crown are enumerated in Domesday (q. v.), including among them 'vicecomites' and 'comites,' who together constituted the body of men called the barons of England. As the sovereign was entitled to demand from the barons military service, homage, and attendance in the courts, so, many of the principal barons, particularly such of them as were knights, had military tenants, from whom they in turn received homage and assistance in administering justice in their baronial courts. These tenants were vassals of the barons, or, in the earliest sense, lesser barons; but by the usage of England, from the Conquest downwards, they were seldom called barons, that term having been generally restricted to the former class, the holders of land direct from the crown, who were next to the king in dignity, commanded his army and his legislative assembly, and obtained the Great Charter from King John. The bifurcation which produced the minor barons was checked by a statute of Edward I., directing that all persons acquiring lands from a subject should hold, not of that subject, but of his superior.

Out of the 'commune concilium' of the king, at which all his barons were bound to attend, arose the parliament. It is not till the close of Henry III.'s reign, beginning of Edward I.'s reign that we find a select number instead of the whole barons attending. The exact period of the change, and the way in which it was made, are still among the obscure points of English history; it has been thought that after the rebellion which was crushed at the battle of Evesham, Henry III. summoned only those barons who were most devoted to his interest. From this period, a new distinction between major and minor barons arose, the latter term being no longer applied to the barons of the barons, but to those barons of the crown who were no longer summoned by writ to parliament. The word baron was more and more used in the restricted sense of a member of parliament, and the right or duty of attendance came in process of time to be founded, not on the tenure, but on the writ.

In Scotland, the barons (or lairds) were such persons as held their lands directly of the crown.

They were the king's advisers, witnessed his charters, and possessed a civil and criminal jurisdiction. All had to give attendance in the Scottish parliament, which consisted of the earls and barons sitting together. After the reign of James I., some of the more powerful barons appear more exclusively as lords of parliament, those whose incomes were below a certain amount obtaining a dispensation from attendance: yet all possessed a right to attend parliament till 1587, when the barons not specially created lords of parliament were required, in place of personally attending, to send representatives of their order from each sheriffdom. The term baron, however, still continued in Scotland to be applied to the whole body of tenants *in capite*, such of them as were lords of parliament being distinctively major, and the others minor barons; but all continuing up to 1747 to possess an extensive civil jurisdiction, and a criminal jurisdiction, from which only treason and the four pleas of the crown were excluded. The representative minor barons sat in the same House with the major barons, and their votes continued down to the union to be recorded as those of the 'Small Barounis.'

**MINORCA**, the largest of the Balearic Isles (q. v.), after Majorca, from which it is distant 25 miles north-east. It is 31 miles long, and 13 miles in greatest breadth, with an area of about 300 square miles. Pop. 37,262. Its coast, broken into numerous bays and inlets, is fringed with islets and shoals, and its surface, less mountainous than that of Majorca, is undulating, rising to its highest point in Mount Toro, 4793 feet above sea-level. Its productions are similar to those of the larger island, although it is neither so fertile in soil nor so well watered as Majorca. The chief towns are Port Mahon, the capital (q. v.), and Ciudadela. In 1871, the exports were £110,507; the imports, £98,273.

**MINORITES**, a name of the Franciscan order (q. v.), derived from the original later denomination adopted by their founder, *Fratres Minores*. This name has left its trace in the popular designation of several localities both in English and foreign cities.

**MINOS**, the name of two mythological kings of Crete. The first is said to have been the son of Jupiter and Europa, the brother of Rhadamanthus, the father of Deucalion and Ariadne, and, after his death, a judge in the infernal regions.—The second of the same name was grandson of the former, and son of Lycastus and Ida. To him the celebrated *Laws of Minos* are ascribed, in which he is said to have received instruction from Jupiter. He was the husband of that Pasiphaë who gave birth to the Minotaur (q. v.) Homer and Hesiod know of only one Minos, the king of Cnossus, and son and friend of Jupiter.

**MINOTAUR** (i. e., the Bull of Minos), one of the most repulsive conceptions of Grecian Mythology, is represented as the son of Pasiphaë and a bull, for which she had conceived a passion. It was half-man half-bull, a man with a bull's head. Minos, the husband of Pasiphaë, shut him up in the Cnossian Labyrinth, and there fed him with youths and maidens, whom Athens was obliged to supply as an annual tribute, till Theseus, with the help of Ariadne, slew the monster. The M. is, with some probability, regarded as a symbol of the Phœnician sun-god.

**MINSK**, a government and province of Western or White Russia, lies south-east of Wilna, and contains 34,860 square miles, with a population of 1,135,588, composed chiefly of Russians, Lithuanians, Poles, and Jews, with a small percentage of Tartars and gipsies. Five-sevenths of the population profess the Greek religion. The chief articles of export

are timber, salt, and corn, which are brought by river-carriage to the Baltic and Black Sea ports. The principal manufactures are fine cloths, linen, and sugar. The soil is not fertile, and is covered to a large extent with woods and marshes, while in many other places it is a sandy waste, but in general the native products suffice for the wants of the inhabitants. The climate is very severe in winter. Cattle and sheep breeding are pursued with tolerable success. The inhabitants of the south or marshy portion of the province are subject to that dreadful disease, the *Plica Polonica* (q. v.).

**MINSK**, the chief town of the government of the same name, is situated on the Svisloetz, an affluent of the Beresina. It is mostly built of wood, but has many handsome stone edifices, among which are the Greek and Roman Catholic cathedrals and seminaries, the church of St Catharine, a number of educational and philanthropic establishments, a public library, and a theatre. The chief manufactures are woollen cloth and leather. Pop. 36,277, many of whom are Jews.

**MINSTER.** See **MONASTERY**.

**MINT** (*Mentha*), a genus of plants, of the natural order *Labiata*; with small, funnel-shaped, 4-fid, generally red corolla, and four straight stamens. The species are perennial herbaceous plants, varying considerably in appearance, but all with creeping root-stocks. The flowers are whorled, the whorls often grouped in spikes or heads. The species are widely distributed over the world. Some of them are very common in Britain, as **WATER M.** (*M. aquatica*), which grow in wet grounds and ditches, and **CORN M.** (*M. arvensis*), which abounds as a weed in cornfields and gardens. These and most of the other species have erect stems. All the species contain an aromatic essential oil, in virtue of which they are more or less medicinal. The most important species are **SPEARMINT**, **PEPPERMINT**, and **PENNY-ROYAL**.—**SPEARMINT** or **GREEN M.** (*M. viridis*), is a native of almost all the temperate parts of the globe; it has erect smooth stems, from one foot to two feet high, with the whorls of flowers in loose cylindrical or oblong spikes at the top; the leaves lanceolate, acute, smooth, serrated, destitute of stalk, or nearly so. It has a very agreeable odour.—**PEPPERMINT** (*M. piperita*), a plant of equally wide distribution in the temperate parts of the world, is very similar to spearmint, but has the leaves stalked, and the flowers in short spikes, the lower whorls somewhat distant from the rest. It is very readily recognised by the peculiar pungency of its odour and of its taste.—**PENNY-ROYAL** (*M. pulegium*), also very cosmopolitan, has a much-branched prostrate stem, which sends down new roots as it extends in length; the leaves ovate, stalked; the flowers in distant globose whorls. Its smell resembles that of the other mints.—All these species, in a wild state, grow in ditches or wet places. All of them are cultivated in gardens; and peppermint largely for medicinal use and for flavouring lozenges. *Mint Sauce* is generally made of spearmint; which is also used for flavouring soups, &c. A kind of *M.* with lemon-scented leaves, called **BERGAMOT M.** (*M. citrata*), is found in some parts of Europe, and is cultivated in gardens. Varieties of peppermint and horse-mint (*M. sylvestris*), with *crisped* or *inflato-rugose* leaves, are much cultivated in Germany under the name of **CURLED M.** (*Krause-minze*); the leaves being dried and used as a domestic medicine, and in poultices and baths. All kinds of *M.* are easily propagated by parting the roots or by cuttings. It is said that mice have a great aversion to *M.*, and that a few leaves of it will keep them at a distance.

Peppermint, Penny-royal, and Spearmint, are used in medicine. The pharmacopoeias contain as *spiritus*, and *oleum* of each of them; the official part being the herb, which should be collected when in flower. *Peppermint* is a powerful diffusible stimulant, and, as such, is antispasmodic and stomachic, and is much employed in the treatment of gastrodynia and flatulent colic. It is also extensively used in mixtures, for covering the taste of drugs. *Penny-royal* and *spearmint* are similar in their action, but inferior for all purposes to peppermint. The ordinary doses are from one to two ounces of the *agua*, a drachm of the *spiritus* (in a wine-glassful of water), and from three to five drops of the *oleum* (on a lump of sugar).

**MINT** (Lat. *moneta*), an establishment for making coins or metallic money (see **MONEY**). The early history of the art being traced under the head **NUMISMATICS**, the present article is mostly confined to a sketch of the constitution of the British mint, and of the modern processes of coining as there followed.

The earliest regulations regarding the English mint belong to Anglo-Saxon times. An officer called a reeve is referred to in the laws of Canute as having some jurisdiction over it, and certain names which, in addition to that of the sovereign, appear on the Anglo-Saxon coins, seem to have been those of the moneyers, or principal officers of the mint, till recently, an important class of functionaries, who were responsible for the integrity of the coin. Besides the sovereign, barons, bishops, and the greater monasteries had their respective mints, where they exercised the right of coinage, a privilege enjoyed by the archbishops of Canterbury as late as the reign of Henry VIII., and by Wolsey as Bishop of Durham, and Archbishop of York.

After the Norman Conquest, the officers of the royal mint became to a certain extent subject to the authority of the exchequer. Both in Saxon and Norman times, there existed, under control of the principal mint in London, a number of provincial mints in different towns of England; there were no fewer than 38 in the time of Ethelred, and the last of them were only done away with in the reign of William III. The officers of the mint were formed into a corporation by a charter of Edward III.; they consisted of the warden, master, comptroller, assay-master, workers, coiners, and subordinates.

The seignorage for coining at one time formed an inconsiderable item in the revenues of the crown. It was a deduction made from the bullion coined, and comprehended both a charge for defraying the expense of coinage, and the sovereign's profit in virtue of his prerogative. In the reign of Henry VI. the seignorage amounted to 6*l.* in the pound; in the reign of Edward I. 1*s.* 2*d.* By 18 Car. II. c. 4. the seignorage on gold was abolished, and has never since been exacted. The share, or remedy, as it is now called, was an allowance for the unavoidable imperfection of the coin.

The function of the mint is in theory to receive gold in ingots from individuals, and return an equal weight in sovereigns; but, in point of fact, gold is now exclusively coined for the Bank of England; for, though any one has still the right to coin gold at the mint, the merchant or dealer has never to obtain any profit for so doing, as the Bank is compelled to purchase all gold tendered to it at the fixed price of £3, 17*s.* 9*d.* an ounce. The increment on the Assay (q. v.), or on the fineness of the metal, which augments the standard weight, and thereby the value of the gold, is a more considerable source of profit to the importer of gold. The ordinary assay, on which the importer purchases the bullion, does not by usage come closer than  $\frac{1}{4}$ th of a grain or  $7\frac{1}{2}$  grains per lb. troy. Before being coined

## MINT.

Gold is subjected to a second and more delicate assay at the mint, and the importer receives the benefit of the difference, amounting to about  $\frac{1}{16}$ th of carat grain =  $3\frac{1}{4}$  troy grains, or nearly 8d. per lb. weight.

Silver, which was formerly, concurrently with gold, a legal tender to any amount, has, by 56 Geo. III. c. 68, ceased to be so. There is a seignorage on both silver and copper money, amounting in silver to 10 per cent., when the price of silver is 5s. per ounce, which, however, from the tear and wear of the coin, brings small profit to the crown. In the copper coinage, the seignorage is no less than 100 per cent. on the average price of copper. The profits of the seignorage, formerly retained by the master of the mint, to defray the expense of coinage, have, since 1837, been paid into the bank, to the credit of the Consolidated Fund.

A new mint was erected on Towerhill in 1810. In 1815, some alterations were made in its constitution; and in 1851 a complete change was introduced in the whole system of administration. The control of the mint was vested in a master and a deputy-master, and comptroller. The mastership, which had, in the early part of the present century, become a political appointment held by an adherent of the government, was restored to the position of a permanent office, the master being the ostensible executive head of the establishment. The operative department was intrusted to the assayer, the melter, and the refiner. The moneyers, who had from early times enjoyed extensive privileges and exemptions, and were contractors with the crown for the execution of the coinage, were abolished, and the contracts with the crown were entered into by the master of the mint, who also made subordinate contracts for the actual manufacture of the coin. Further changes were made on the administration of the mint in 1869. The mastership was added to the duties of the Chancellor of the Exchequer, without any addition of salary, and the offices of deputy-master and comptroller were amalgamated. A yearly saving of £10,000 is believed to have been effected by the changes of 1851, and a further £8000 by those of 1869, with an increase of efficiency. It is at present in contemplation to remove the mint from Towerhill to the rear of the Thames embankment at Whitefriars, with new and improved machinery. Mints have lately been established at Sydney and Melbourne to coin the gold so largely found in Australia.

*Processes of coining.*—Down to the middle of the 15th c., little or no improvement seems to have been made in the art of coining from the time of its invention. The metal was simply hammered into slips, which were afterwards cut up into squares of one size, and then forged round. The required impression was given to these by placing them in turn between two dies, and striking them with a hammer. It was not easy by this method to place the dies exactly above each other, or to apply proper force, and so made were always faulty, and had the edges unfinished, which rendered them liable to be clipped. The first great step was the application of the screw, invented in 1553 by a French engraver of the name of Brucher. The plan was found expensive at first, and it was not till 1662 that it altogether superseded the hammer in the English mint. The chief steps in coining as now practised are as follows: The gold or silver to be coined is sent to the mint in the form of *ingots* (Ger. *eingiessen*, Du. *ingieten*, to pour, to cast), or castings; those of gold weighing each about 180 oz., while the silver ingots are much larger. Before melting, each ingot is tested as to its purity by assaying (q. v.), and then weighed, and the results carefully recorded. For melting the gold, pots or

crucibles of plumbago are used, made to contain each about 1200 oz. The pots being heated white, in furnaces, the charge of gold is introduced along with the proper amount of copper (depending upon the state of purity of the gold as ascertained by the assay), to bring it to the standard, which is 22 parts of pure gold to 2 of copper (see ALLOY). The metal when melted is poured into iron moulds, which form it into bars 21 inches long,  $1\frac{1}{4}$  inch broad, and 1 inch thick, if for sovereigns; and somewhat narrower, if for half-sovereigns. For melting silver (the alloy of which is adjusted to the standard of 222 parts of silver to 18 of copper), malleable iron pots are used, and the metal is cast into bars similar to those of gold.

The new copper, or rather bronze coinage, issued in 1860, is an alloy consisting of 95 parts of copper, 4 of tin, and 1 of zinc. The coins are only about half the weight of their old copper representatives. The processes of casting and coining the bronze are essentially the same as in the case of gold and silver.

The operation of *rolling* follows that of casting. It consists in repeatedly passing the bars between pairs of rollers with hardened steel surfaces, driven by steam-power; the rollers being brought closer and closer as the thickness becomes reduced. At a certain stage, as the bars become longer, they are cut into several lengths; and to remove the hardness induced by the pressure, they are annealed. The finishing rollers are so exquisitely adjusted that the *fillets* (as the thinned bars are called) do not vary in thickness in any part more than the ten-thousandth part of an inch. The slips are still further reduced in the British mint at what is called the 'draw-bench,' where they are drawn between steel dies, as in wire-drawing, and are then exactly of the necessary thickness for the coin intended.

The fillets thus prepared are passed to the tryer, who, with a hand-punch, cuts a trial-blank from each, and weighs it in a balance; and if it vary more than  $\frac{1}{16}$ th of a grain, the whole fillet is rejected.

For cutting out the *blanks* of which the coins are to be made, there are in the British mint twelve presses arranged in a circle, so that one wheel with driving cams, placed in the centre, works the whole. The punches descend by pneumatic pressure, and the fillets are fed into the presses by boys, each punch cutting out about 60 blanks a minute. The scrap left after the blanks are cut out, called *scissel*, is sent back to be remelted.

Each blank is afterwards weighed by the automaton balance—a beautiful and most accurate instrument, which was added to the mint about ten years ago. It weighs 23 blanks per minute, and each to the 0.01 of a grain. The standard weight of a sovereign is 123.274 grains, but the mint can issue them above or below this to the extent of 0.2568 of a grain, which is called *the remedy*. Blanks which come within this limit are dropped by the machine into a 'medium' box, and pass on to be coined. Those below the required weight are pushed into another box to be remelted, but those above it into another, and are reduced by filing. The correct blanks are afterwards rung on a sounding iron, and those which do not give a clear sound are rejected as dumb.

To insure their being properly milled on the edge, the blanks are pressed edgewise in a machine between two circular steel-plates, which raises the edges, and at the same time secures their being perfectly round. After this they are annealed to soften them, before they can be struck with dies; they are also put into a boiling pot of dilute sulphuric acid, to remove any oxide of copper from the

# MINT—MINUTE.

surface. Subsequently, they are washed with water, and dried with great care in hot sawdust, and finally in an oven at a temperature slightly above boiling water. Without these precautions, the beautiful bloom upon new coin could not be secured.

We now come to the press-room, where the blanks receive the impression which makes them perfect coins. The coining-press is shewn in the fig. and

Coining-press.

there are eight of them in all, ranged in a row upon a strong foundation of masonry. CCB is the massive iron frame into which the screw D works, the upper part B being perforated to receive it. On the bottom of this screw the upper steel die is fixed by a box, the lower die being fixed in another box attached to the base of the press. The dies have, of course, the obverse and reverse of the coin upon them. See DIE-SINKING. The blank coin is placed on the lower die, and receives the impression when the screw is turned round so as to press the two dies forcibly towards each other. A steel ring or collar contains the coin while it is being stamped, which preserves its circular form, and also effects the milling on the edge. In cases where letters are put on the edge of a coin, a collar divided into segments working on centre-pins, is used. On the proper

pressure being applied, the segments close round and impress the letters on the edge of the coin.

The screw of the press is put in motion by means of the piece A, which is worked by machinery driven by steam-power, and situated in a room above the coining-room. The steam-engine exhausts an air-chamber, and from the vacuum produced, an air-engine works a series of air-pumps which communicate a more exact and uniform motion to the machinery of the stamping-press than by the ordinary condensing engine. The loaded arms RR strike against blocks of wood, whereby they are prevented from moving too far and run the risk of breaking the hard steel dies by bringing them in contact. The press keeps the die on the coin with a twisting motion, so that if it were to rise up in the same way, it would not strike the coin; there is, in consequence, an arrangement which, by means of a wide notch in the ring A, the die to be raised up a certain distance before it begins to turn round with the screw.

On the left side of the figure, the arrangement for feeding the blanks and removing the coins as they are stamped, is shewn. A lever HIK, moving on fulcrum I, is supported by a bar Q, fixed to the frame of the press. The top of this lever is guided by a sector 7 fixed upon the screw D. In this there is a spiral groove, which, as the screw turns round, moves the end H of the lever to or from the screw, the other end K being moved at the same time either towards or away from the centre of the press. The lower end of the lever moves a slider which is directed exactly to the centre of the die and on a level with the upper surface of the die. The slider is a thin steel-plate in two pieces joined by a joint, and having a circular cavity at the joint, which, when its limbs are shut, grasps a blank coin by the edge. This piece drops out of the slider as the limbs separating. There is a tube at K which the attendant keeps filled with blank pieces; it is at the bottom, so that the pieces rest on the slider. When the press is screwed down, the slider is pushed back to its furthest extent, and its circular cavity comes exactly beneath the tube. A blank coin now drops in, and is carried, when the screw rises, to the collar which fits over the lower die. The slider then returns for another blank, the upper die descends to give the impression on the coin. Each time the slider brings a new blank to the die, it at the same time pushes off the piece struck. An arrangement of springs lifts the collar to enclose the coin while it is being struck.

It is found on examining the coins that 1 in 200 is imperfectly finished; these are rejected, the rest are finally weighed into bags and subjected to the process of picking. This consists in taking from each bag a certain number of sovereigns or other coins, and subjecting them to a final examination by weight and assay, after which they are delivered to the public.

**MINUET**, the air of a most graceful dance, originally from Poitou, in France. It is performed in a slow tempo. The first minuet is said to have been composed by Lully the Elder, and was danced by Louis XIV. in 1653 at Versailles with his mistress. The music of the minuet is in 3/4 time, and is well known in England by the celebrated *Minuet de la Cour*, which is frequently introduced in theatrical performances.

**MINUTE**, a rough draft of any proceeding or instrument; so called from being taken down in a minute or small writing, to be afterwards ingrossed. See **INGROSS**.—**MINUTE**, in Law, a memorandum or record of some act of a court of parties; in the latter sense, it is used chiefly

## MINUTE—MIRABEAU.

Scotland, as in the case of minute of agreement, minute of sale, &c.

**MINUTE**, the 60th part of an hour; also the 60th part of a degree of a circle. See **SEXAGESIMAL ARITHMETIC**.—**MINUTE**, in Architecture, is the 60th part of the diameter of the shaft of a classic column, measured at the base. It is used as a measure to determine the proportions of the order.

**MIOCENE** (Gr. less recent), a term introduced by Lyell to characterise the Middle Tertiary strata, which he supposes to contain a smaller proportion of recent species of mollusca than the newer Pliocene, and more than the older Eocene. He estimates the proportion of living to fossil species in the Eocene at 25 per cent.

Strata of this age occur in Britain in two limited and far separated localities—in the island of Mull, and at Dartmoor in the south-east of England. In this last district, they exist at Bovey Tracey, in a flat area of ten miles long by two miles broad, and consist of clay interstratified with beds of imperfect gneiss. Pengelly and Heer have recently examined the strata of this small basin, and have found that the plants are of Miocene age, and belong to the same species as those found in similar deposits, not only on the continent, but in Iceland, Greenland, and Arctic America. Their *facies* indicates a warmer climate than the present, and the geographical range of the species is unexampled in the existing flora. The Mull beds are situated at the headland of Mull, and consist of interstratified basalts, ashes, and lignites. There are three leaf-beds, varying in thickness from 1½ to 2½ feet, separated by two beds of ash, the whole resting on, and covered by strata of basalt. The whole thickness is 131 feet. It is supposed that the leaf-beds were deposited in a shallow lake or marsh, in the vicinity of an active volcano. One of the beds consists of a mass of compressed leaves without stems, and accompanied with abundant remains of an equisetum, which grew in the marsh into which the leaves were blown. The leaves belong to dicotyledons and conifers, and are of species similar to those of Bovey Tracey.

The Fahluns of France are of this age, as are also part of the Mollasi of Switzerland, and the Mayence and Vienna basins. Of the same period are the highly fossiliferous deposits in the Sewalik Hills, India, containing the remains of several elephants, a mammoth, hippopotamus, giraffe, and large ostrich, besides several carnivora, monkeys, and crocodiles, and a large tortoise, whose shell measured 20 feet across. The European beds contain the remains of the *Dinotherium* (q. v.).

**MIRABEAU**, HONORÉ GABRIEL RIQUETTI, COMTE DE, was born 9th March 1749, at Bignon, near Nemours. He was descended, by his own account, from the ancient Florentine family of Arrighetti, and being expelled from their native city in 1268, on account of Ghibelline politics, settled in Provence. Jean de Riquetti or Arrighetti purchased the estate of Mirabeau in 1562; his grandson, Thomas, happened to entertain here, in 1660, Louis XIV. and Cardinal Mazarin, on which occasion he received from the monarch the title of Marquis Victor Riquetti. Marquis de Mirabeau (born 1715, died 1791), the father of Honoré, was a vain and foolish man, wasted his patrimony, wrote books of philosophy and philosophy, as *L'Ami des Hommes* &c. (Paris, 1755), and was a cruel tyrant in his own house. He procured no fewer than fifty-four *lettres de cachet* at different times against his wife and his children. Honoré, his eldest son, was endowed with an athletic frame and extraordinary mental abilities, but was of a fiery temper, and disposed to every kind of excess. He became a lieutenant in a

cavalry regiment; but continued to prosecute various branches of study with great eagerness, whilst outrunning his companions in a career of vice. An intrigue with the youthful wife of an aged marquis brought him into danger, and he fled with her to Switzerland, and thence to Holland, where he subsisted by his pen, amongst other productions of which, his *Essai sur le Despotisme* attracted great attention. Meanwhile, sentence of death was pronounced against him; and the French minister, at his father's instigation, demanding that he should be delivered up to justice, he and his paramour were apprehended at Amsterdam, and he was brought to the dungeon at Vincennes, and there closely imprisoned for 42 months. During this time he was often in great want, but employed himself in literary labours, writing an *Essai sur les Lettres de Cachet et les Prisons d'état*, which was published at Hamburg (2 vols. 1782), and a number of obscene tales, by which he disgraced his genius, although their sale supplied his necessities. After his liberation from prison, he subsisted chiefly by literary labour, and still led a very profligate life. He wrote many effective political pamphlets, particularly against the financial administration of Calonne, receiving pecuniary assistance, it was said, from some of the great bankers of Paris; and became one of the leaders of the Liberal party. When the States-general were convened, he sought to be elected as a representative of the nobles of Provence, but was rejected by them on the ground of his want of property; and left them with the threat that, like Marius, he would overthrow the aristocracy. He purchased a draper's shop, offered himself as a candidate to the Third Estate, and was enthusiastically returned both at Aix and Marseille. He chose to represent Marseille, and by his talents and admirable oratorical powers soon acquired great influence in the States-general and National Assembly. Barnave well characterised him as 'the Shakspeare of eloquence.' He stood forth as the opponent of the court and of the aristocracy, but regarded the country as by no means ripe for the extreme changes proposed by political theorists, and laboured, not for the overthrow of the monarchy, but for the abolition of despotism, and the establishment of a constitutional throne. To suppress insurrection, he effected, on 8th July 1789, the institution of the National Guard. In some of the contests which followed, he sacrificed his popularity to maintain the throne. The more that anarchy and revolutionary frenzy prevailed, the more decided did he become in his resistance to their progress; but it was not easy to maintain the cause of constitutional liberty at once against the supporters of the ancient despotism and the extreme revolutionists. The king and his friends were long unwilling to enter into any relations with one so disreputable, but at last, under the pressure of necessity, it was resolved that M. should be invited to become minister. No sooner was this known, than a combination of the most opposite parties, by a decree of 7th November 1789, forbade the appointment of a deputy as minister. From this time forth, M. strove in vain in favour of the most indispensable prerogatives of the crown, and in so doing exposed himself to popular indignation. He still continued the struggle, however, with wonderful ability, and sought to reconcile the court and the Revolution. In December 1790, he was elected president of the Club of the Jacobins, and in February 1791, of the National Assembly. Both in the Club and in the Assembly, he displayed great boldness and energy; but soon after his appointment as president of the latter, he sank into a state of bodily and mental weakness, consequent upon his great exertions and his continued debaucheries, and

## MIRACLE—MIRACLE PLAYS.

died 2d April 1791. He was interred with great pomp in the church of Saint Genevieve, the 'Pantheon'; but his body was afterwards removed, to make room for that of Marat. A complete edition of his works was published at Paris in 9 vols. in 1825—1827. His natural son, Lucas Montigny, published *Mémoires Biographiques, Littéraires et Politiques de Mirabeau* (2d edit. 8 vols. Par. 1841), the most complete account which we have of his life. See also Carlyle's sketch of Mirabeau in his *Miscellaneous Essays*, and his *French Revolution*.

MIRACLE, a term commonly applied to certain marvellous works (healing the sick, raising the dead, changing of water into wine, &c.) ascribed in the Bible to some of the ancient prophets, and to Jesus Christ, and one or two of his followers. It signifies simply that which is wonderful—a thing or a deed to be wondered at, being derived directly from the Latin *miraculum*, a thing unusual—an object of wonder or surprise. The same meaning is the governing idea in the term applied in the New Testament to the Christian miracles, *teras*, a marvel, a portent; besides which, we also find them designated *dunamis*, powers, with a reference to the power residing in the miracle-worker; and *semeia*, signs, with a reference to the character or pretensions of which they were assumed to be the witnesses or guarantees. Under these different names, the one fact recognised is a deed done by a man, and acknowledged by the common judgment of men to exceed man's ordinary powers; in other words, a deed *supernatural*, above or beyond the common powers of nature, as these are understood by men.

In the older speculations on the subject, a miracle was generally defined to be a violation or suspension of the order of nature. While, on the one hand, it was argued (as by Hume), that such a violation or suspension was absolutely impossible and incredible; it was maintained, on the other, that the Almighty, either by his own immediate agency, or by the agency of others, could interfere with the operation of the laws of nature, in order to secure certain ends, which, without that interference, could not have been secured, and that there was nothing incredible in the idea of a law being suspended by the Person by whom it had been made. The laws of nature and the will or providence of God were, in this view, thus placed in a certain aspect of opposition to each other, at points here and there clashing, and the stronger arbitrarily asserting its superiority. Such a view has, with the advance of philosophical opinion, appeared to many to be inadequate as a theory, and to give an unworthy conception of the Divine character. The great principle of Law, as the highest conception not only of nature, but of Divine Providence, in all its manifestations, has asserted itself more dominantly in the realm of thought, and led to the rejection of the apparently conflicting idea of 'interference,' implied in the old notion of miracle. Order in nature, and a just and uncapricious will in God, were felt to be first and absolutely necessary principles. The idea of miracle, accordingly, which seems to be now most readily accepted by the advocates of the Christian religion, has its root in this recognised necessity.

All law is regarded as the expression, not of a lifeless force, but of a perfectly wise and just will. All law must develop itself through natural phenomena; but it is not identified with or bound down to any necessary series of these. If we admit the mainspring of the universe to be a living will, then we may admit that the phenomena through which that will, acting in the form of law, expresses itself, may vary without the will varying or the law being broken. We know absolutely nothing of the mode

of operation in any recorded miracle; we only see certain results. To affirm that these results are either impossible in themselves, or necessarily violations of natural law, is to pronounce a judgment on imperfect data. We can only say that, under an impulse which we must believe proceeds from the Divine will, in which all law exists, the phenomena which we have been accustomed to expect have not followed on their ordinary conditions. But from our point of view we cannot affirm that the question as to how this happens is one of interference or violation; it is rather, probably, one of higher and lower action. The miracle may be but the expression of one Divine order and beneficent will in a new shape—the law of a greater freedom, to use the words of Trench, swallowing up the law of a lesser.

Nature being but the plastic medium through which God's will is ever manifested to us, and the design of that will being, as it necessarily must be, the good of his creatures, that theory of miracle is certainly most rational which does not represent the ideas of laws and of the will of God as separate and opposing forces, but which represents the Divine will as working out its highest moral ends, not against, but through law and order, and winning from these a new issue, when it has a special beneficent purpose to serve. And thus, too, we are enabled to see in miracle not only a wonder and a power, but a sign—a revelation of Divine character, never arbitrary, always generous and loving, the character of one who seeks through all the ordinary courses of nature and operation of law to further His creatures' good, and whose will, when that end is to be served, is not restricted to any one necessary mode or order of expression. Rightly interpreted, miracle is not the mere assertion of power, or a mere device to impress an impressive mind; it is the revelation of a will which, while leaving nature as a whole to its established course, can yet witness to itself as above nature, when, by doing so, it can help man's moral and spiritual being to grow into a higher perfection.

The evidence for the Christian miracles is of a twofold kind—external and internal. As alleged facts, they are supposed to rest upon competent testimony, the testimony of eye-witnesses, who were neither deceived themselves, nor had any motive to deceive others. They occurred not in privacy, like the alleged supernatural visions of Mohammed, but for the most part in the open light of day, amidst the professed enemies of Christ. They were not isolated facts, nor wrought tentatively, or with difficulty; but the repeated, the overflowing expression, as it were, of an apparently supernatural life. It seems impossible to conceive, therefore, that the apostles could have been deceived as to their character. They had all the means of scrutinising and forming a judgment regarding them that they could well have possessed; and if not deceived themselves, they were certainly not deceivers. There is no historical criticism that would now maintain such a theory; even the most positive unbelief has rejected it. The career of the apostles forms throughout an irrefragable proof of the deep-hearted and incorruptible sincerity that animated them. The gospel miracles, moreover, are supposed in themselves to be of an obviously Divine character. They are, in the main, miracles of healing, of beneficence, in which the light equally of the Divine majesty and of the Divine love shines—witnessing to the eternal life which underlies all the manifestations of death and all the traces of sorrow in the lower world and lifting the mind directly to the contemplation of his life.

MIRACLE PLAYS. See MYSTERIES.

# MIRAGE—MIRROR.

**MIRAGE**, a phenomenon extremely common in localities, and as simple in its origin as shining in its effects. Under it are classed the appearance of distant objects as double, or as if doubled in the air, erect or inverted, &c. One of mirage is a diminution of the density of the air at the surface of the earth, produced by the emission of heat from the earth, or in some way; the denser stratum being thus placed instead of, as is usually the case, below the surface. Now, rays of light from a distant object, situated in the denser medium (i. e., a little above the level), coming in a direction nearly parallel to the earth's surface, meet the rarer medium at an obtuse angle, and (see REFRACTION) instead of passing into it, are reflected back to the denser medium; the common surface of the two media acting as a mirror. Suppose, then, a spectator to be situated on an eminence, and looking at an object situated like himself in the denser stratum of air, he will see the object by means of directly transmitted rays; but besides this (see fig. 2), rays from the object will be reflected from the upper surface of the rarer stratum of air beneath to his eye. The image produced by the reflected rays will appear inverted, and below the real object, just as an image reflected in water appears when observed from a distance. If the object is

Fig. 1.

or portion of sky, it will appear by the reflected rays as lying on the surface of the earth, bearing a strong resemblance to a sheet of water; also, as the reflecting surface is irregular, constantly varies its position, owing to the communication of heat to the upper stratum, the reflected image will be constantly changing, and will present the appearance of a water ruffled by the wind. This form of mirage, even experienced travellers have found to be very deceptive, is of common occurrence in the deserts of Lower Egypt, Persia, Tartary, &c. Particular states of the atmosphere, reflection of light only of the rays takes place at the surface of the dense medium, and thus double images are formed, one by reflection, and the other by refraction—the first inverted, and the second erect. Phenomena of mirage are frequently much strange and complicated, the images being much distorted and magnified, and in some cases occurring at a considerable distance from the object, as in the case of a tower or church seen at sea, or a vessel over dry land, &c. The most remarkable form of mirage known as *looming*, is very frequently observed at sea, and consists in an apparent elevation of the object. A most remarkable case of this sort occurred on the 26th of July, 1798, at Hastings. From this place the coast is fifty miles distant; yet, from the whole coast of France from Calais to Marseilles was distinctly visible, and continued three hours. In the Arctic regions it is not uncommon for whale-fishers to discover the proximity of other ships by means of their being seen elevated in the air, though the ships were may be below the horizon. Generally, when a ship is above the horizon, only one image, erect or inverted, is found; but when it is wholly below the horizon, double images are seen, one erect and the other inverted, are distinctly seen. The faithfulness and distinctness

of these images at times may be imagined from the fact, that Captain Scoresby, while cruising off the coast of Greenland in 1822, discovered the propinquity

Fig. 2.

of his father's ship from its inverted image in the sky. Another remarkable instance of M. occurred in May 1854, when, from the deck of H. M. screw-steamer, *Archer*, then cruising off Oesel, in the Baltic, the whole English fleet of nineteen sail, then nearly thirty miles distant, was seen as if suspended in the air upside down. Beside such phenomena as these, the celebrated *Fata Morgana* (q. v.) of the Straits of Messina sinks into insignificance. The *Spectre of the Brocken*, in Hanover, is another celebrated instance of mirage. Its varieties are indeed numberless, and we refer those who wish for further information to Brewster's *Optics*, Biot's *Traité de Physique*, and for the mathematical theory of the mirage to the works of Biot, Monge, and Wollaston. See also REFLEXION and REFRACTION.

**MIRANDOLA**, a town of Northern Italy, in the province of Modena, and 20 miles north-north-east of the city of that name. It stands in the midst of a low-lying and somewhat unhealthy flat, and contains numerous churches, a cathedral, and a citadel. Rice is much cultivated in the vicinity, and the breeding of silk-worms is an important branch of industry. Pop. variously stated at from 6000 to 10,000.

**MIRECOURT**, a town of France in the department of Vosges, in a picturesque district, 20 miles south of Nancy. It is famous for its manufactures of lace, and of church-organs and stringed musical instruments. Pop. (1872) 5089.

**MIRFIELD**, a manufacturing village of the West Riding of Yorkshire, England, three miles east of Dewsbury. The manufactures are fancy and other woollen fabrics, and cotton goods. It is one of the chief railway centres in the country. Pop. (1871) 12,869.

**MIRPUR**, a flourishing town of India, in Sindh, on the left bank of the Piniari, 45 miles south of Hyderabad. It contains a fort capable of accommodating 200 men, and which commands the route from Hyderabad to Cutch. The surrounding district is fertile and well cultivated. Pop. 10,000.

**MIRROR**, a reflecting surface, usually made of glass, lined at the back with a brilliant metal, so as strongly to reflect the image of any object placed before it. When mirrors were invented, is not known, but the use of a reflecting surface would become apparent to the first person who saw his own image reflected from water; and probably some ages after the civilization of man commenced, the still waters of ponds and lakes were the only mirrors; but we read in the Pentateuch of mirrors of brass being used by the Hebrews. Mirrors of

bronze were in very common use amongst the ancient Egyptians, Greeks, and Romans, of which many specimens are preserved in museums. Praxiteles taught the use of silver in the manufacture of mirrors in the year 328 B. C. Mirrors of glass were first made at Venice in 1300; and judging from those still in existence—of which one may be seen at Holyrood Palace, in the apartments of Queen Mary—they were very rude contrivances, compared with modern ones. It was not until 1673 that the making of mirrors was introduced into England. It is now a very important manufacture; and mirrors can be produced of any size to which plate-glass can be cast. After the plate of glass is polished on both sides, it is laid on a perfectly level table of great strength and solidity, usually of smooth stone, made like a billiard-table with raised edges; a sheet or sheets of tinfoil sufficient to cover the upper surface of the glass are then put on, and rubbed down smooth, after which the whole is covered with quicksilver, which immediately forms an amalgam with the tin. The superfluous mercury is then run off, and a woollen cloth is spread over the whole surface, and square iron weights are applied, until the whole presents a compact mass of iron of two or three pounds to the square inch. After this pressure has been continued a day and night, the weights and the cloth are removed, and the glass is removed to another table of wood with a movable top, which admits of the glass being slightly inclined at first, and the inclination gradually increased, until the unamalgamated quicksilver has perfectly drained away, and only the surface of perfect amalgam remains coating the glass, and perfectly adherent to it. From eighteen days to a month are required to complete this process.

**MIRZA**, a contraction of *Emir Zadah*, 'son of the prince,' is, when prefixed to the surname of the individual, the common title of honour among the Persians; but when annexed to the surname, it designates a prince or a male of the blood-royal.

**MIRZAPUR**, a town of British India, capital of the district of the same name, on the right bank of the Ganges, which is here half a mile wide, and crossed by a ferry, 40 miles south-west of Benares. It has some manufactures of carpets, cottons, and silks, and is the greatest cotton-mart in India. Pop. (1872) 71,849. The district of M., in the North-west Provinces, is watered by the Ganges and the Sone. Lat. 23° 50'—25° 30' N.; long. 82° 11'—83° 39' E. Area, 5235 square miles. Pop. (1872) almost all Hindus, 1,054,413. The chief productions, beside the usual cereals, are cotton, indigo, and sugar. The climate is, on the whole, unhealthy for Europeans.

**MISDEMEANOUR** is one of the technical divisions of crimes, by the law of England and Ireland. The usual division of crimes is into treason (which generally stands by itself, though, strictly speaking, included in), felony, and misdemeanour. The offence of greatest enormity is treason, and the least is misdemeanour. The original distinction between felony and misdemeanour consisted in the consequences of a conviction. A party convicted of felony, if capital, forfeits both his real and personal estate; if not capital, his personal estate only. A party convicted of misdemeanour forfeits none of his property. The distinction is not kept up between the two classes of crimes by any greater severity of punishment in felony, for many misdemeanours are punished as severely as some felonies. But it has been the practice of the legislature, when creating new offences, to say whether they are to be classed with felony or misdemeanour; and when this is done,

the above incidents attach to the crime accordingly.

**MISE'NO**, a promontory of the province of Naples, 9 miles south-west of the city of Naples. On the outskirts of the promontory are the ruins of the ancient city of Misenum, in a vast church and theatre. M. is much visited on account of its wonderful grotto Draconara, a curious subterranean building or labyrinth, the Hundred Chambers, supposed to have been anciently employed as dungeons.

**MISERERE**, the name by which, in Church usage, the 50th Psalm of the Vulgate (the authorised version) is commonly known. It is of the so-called 'Penitential Psalms,' and is commonly understood to have been composed by David in the depth of his remorse for the double murder of his brother and his wife, which the prophet Nathan rebuked in the well-known parable (2 Sam. xii.). Another version, however, attributes this psalm to Manasseh, some of the psalm-writers of the Captivity. Miserere is of frequent occurrence in the service of the Roman Church; and in the celebrated *Offices of Tenebræ*, as performed in the Sixtine Chapel at Rome, it forms, as chanted by the choir, one of the most striking and impressive chants in the entire range of sacred music, sung on each of the three nights in Holy Week (q. v.) on which the office of Tenebræ is held, different music on each of the three occasions, three composers being Bai, Baini, and the still more celebrated Allegri.—Miserere is also the name of one of the evening services in Lent, which is called from the singing of that psalm, and includes a sermon, commonly on the duty of repentance for sin.

**MISERERE**, a projection on the under side of the seats of the stalls of medieval churches.

Miserere:

From Billing's *Christie Cathedral*.

chapels, &c. They are usually ornamented with carved work, and are so shaped, that when the seats proper are folded up, they form a small seat on a higher level, sufficient to afford some support to a person resting upon it. Aged and infirm ecclesiastics were allowed to use these during long services.

**MISFEASANCE**, in Legal Language, means the doing of a positive wrong, in contradistinction to nonfeasance, which means a mere omission.

metimes followed with different legal consequences, according as they fall under the head of chance or nonfeasance.

**MISHNA** (from Heb. *shana*, to learn; erroneously designate Repetition) comprises the body of Oral Law, or the juridico-political, civil, and criminal code of the Jews; and forms, as such, a complement to the Mosaic or Written Law, which it explains, amplifies, and immutably fixes. It was not, however, the sole authority of the rabbis, and the masters, on which these explanations and the new ordinances to which they gave birth, but rather certain distinct and well-defined traditions, traced to Mount Sinai. No less were certain special letters and signs of the Written Law appealed to in some cases, as containing an indication to the special, newly issued, prohibitions or rules. See **HALACHA**. The Mishna (to which the Toseftas and Boraithas formations) was finally redacted, after some earlier collections, by Jehudah Hanassi, in 220 A.D. at Tiberias. It is mostly written in pure Hebrew, and is divided into six portions (*Sedarim*): 1. *Shema* (Seeds), on Agriculture; 2. *Moed* (Feast), on Sabbath, Festivals and Fasts; 3. *Nashim* (Women), on Marriage, Divorce, &c. (embracing the laws on the Nazirship and Vows); 4. *Nezikin* (Damages), chiefly civil and penal law containing the ethical treatise *Aboth*; 5. *Kodashim* (Sacred Things), Sacrifices, &c.; descriptions of the Temple of Jerusalem, &c.; 6. *Tahara* (Purifications), on pure and impure things and laws. See also **TALMUD**.

**KO'LCZ**, the principal town in the county of Hungary, situated at the extremity of a fertile valley, 25 miles north-east of Erlau. It is connected with Debreczin by railway, and contains several churches, two gymnasia, and other educational institutions. Wine and melons are extensively cultivated. From the iron obtained in the neighbourhood, the best steel in Hungary is made. The principal trade is in wine. Pop. (1870) 21,119.

**NOMER** is the giving of a wrong name to a person in a suit. Formerly, the objection of misnomer was of some importance, but now is of none, and is easily cured by amendment.

**PRISION** is, in English Law, a clerical error made in drawing up a record of a court of law.

**REPRESENTATION**, in point of law, or, more frequently termed, fraudulent misrepresentation, is that kind of lie for which courts of law give redress. It consists in a wilful falsehood as to some material thing connected with or not connected with a contract; the object being that the party should act upon it as true. The legal principle is, that if the party so relying on its truth and thereby suffering damage, he can sue the deceiver for the damage. It has sometimes been supposed that a deceit or misrepresentation must have been made to some contract, or arise out of some connection between the parties, and that the law making it should have some private interest; but this is a mistake; and recent cases have established, that if a person wilfully—i.e., not knowing anything at all one way or the other about the matter, or knowing the real truth, and yet sending something, with the intention that it should act on such misrepresentation, and thereby suffering damage, the right of action accrues to the deceived party. One remarkable exception to this doctrine, however, occurs in the case of the contract of marriage, where either party has in general no remedy against the other for misrepresentations as

to his or her property, connections, &c. It is not necessary that the misrepresentation should be made in writing, in order to give rise to the action, except in cases where the party gives representations as to the conduct, credit, ability, trade, or dealings of a third party, in order that such third party shall obtain credit, money, or goods thereby. The doctrine of misrepresentation has acquired great consequence of late, owing to the extension of the system of joint-stock companies, and the practice of the directors and officers publishing, or being parties to fraudulent reports, accounts, and circulars as to the credit and stability of such undertakings. It is now settled, that not only every director, but every clerk in the service of the directors, who knowingly and wilfully concurs and takes a part in publishing or circulating such false reports, whereby strangers are led to believe and act on them, and thereby suffer pecuniary loss, is liable to an action of damages at the suit of such strangers. It is also a general rule affecting contracts (other than marriage), that misrepresentation in some material point bearing on the contract, and likely to induce the party to enter into such contract, will render the contract void; but in order to make a trifling misrepresentation have the same effect, the party must warrant such representation to be true; in which case, whether trifling or not, or whether wilful or not, a misrepresentation avoids the contract; and this is generally the case in contracts of life and fire insurance. Against such a practice, Lord St Leonards lately remonstrated, as one involving great hardship to the class of insurers, who, after paying premiums for years, find at last their security gone. Another class of fraudulent misrepresentations, of great consequence, and now brought within the criminal law to a large extent, is that of counterfeiting trade-marks, as to which, see **TRADE-MARKS**.

**MISSA DI VO'OE**, a term used in the art of singing, meaning the gradual swelling and again diminishing of the sound of the voice on a note of long duration.

**MISSAL**, the volume containing the prayers used in the celebration of the Mass. Anciently, considerable variety in minor details prevailed among the books in use in different countries, and even in different churches of the same country. With the view of restoring uniformity, the pope, in virtue of a decree of the Council of Trent, in 1570, ordered that all churches which had not, for a clearly ascertained period of 200 years, enjoyed an uninterrupted use of a peculiar service-book of their own, should thenceforth adopt the Roman Missal. Of this exemption, several churches in Germany, France, and even in Italy, availed themselves; but in later times, the great majority have conformed to the Roman use. The Roman Missal has twice since that date been subjected to revision and correction—in 1604 by Clement VIII., and in 1634 by Urban VIII. The latter recension still continues in use. The missals of the oriental rites differ from that of the Roman Church, each having for the most part its own proper form. See **LITURGY**.

**MISSIONS**, enterprises of the Christian Church for the conversion of the nations to Christianity, by sending to them teachers called *missionaries*.

The first Christians displayed great zeal in preaching the gospel to the heathen; Christian teachers continued to go forth for this purpose into heathen countries until about the 9th c., and although other and less worthy means were too often employed, the labours of Palladius in Ireland, of Columba in Scotland, of Augustine in England, of Gallus and Emmeran in Alemannia, of Kilian

## MISSIONS.

in Bavaria, of Willibrod in Franconia, of Swidvrit in Friesland, of Siegfried in Sweden, of Boniface in Thuringia and Saxony, of Adalbert in Prussia, of Cyril and Methodius amongst the Slavonians, and of many such early missionaries, were unquestionably very instrumental in the extension of Christianity in Europe. After the Reformation, the Roman Catholic Church, roused to activity by its losses and dangers, not only sent forth missionaries to confirm its adherents in Protestant countries, and to win back Protestants, but also sought to repair its losses by new acquisitions from the vast domain of heathenism. With this view, the *Congregatio de Propaganda Fide* was constituted by Gregory XV. in 1622, and the *Collegium de Propaganda Fide* (see PROPAGANDA) by Urban VIII. in 1627, and in a number of places, institutions, called *seminaries*, were established for the training of missionaries. Jesuit missionaries earnestly prosecuted their work amongst the Indians of South America, from the middle of the 16th c. to the middle of the 18th, when they were expelled by the Portuguese and Spanish governments, because their political power had become too formidable. They are accused of administering baptism with too great readiness; but they were certainly successful in extending civilisation amongst the Indians, particularly of Paraguay. Jesuit missions to India and Japan were founded by Francis Xavier (q. v.) in the middle of the 16th century. In Japan, the missionaries made great progress at first; and in 1582 they boasted of 150,000 converts, 200 churches, and 59 religious houses of their order in that empire; but ere the middle of the 16th c., the whole work had been overthrown, and every missionary expelled. In China, similar rapid success was enjoyed, and was followed by a similar period of persecution, although the destruction effected was more partial than in Japan, and the Church of Rome continued to subsist in China, its missionaries and members enduring great hardships, and many of them evincing their sincerity even by their death. There are not a few Roman Catholics in China at the present time. In Abyssinia also, the Jesuits made great progress in the 17th century, and for a time attained great power in the country; but their interference in political matters led to their complete expulsion. In the 17th c., the Jesuits boasted of the vast success of their mission in Madura, a province of Southern India; but it was found to be rather apparent than real, and to have been attained by a compromise of Christianity and the employment of unworthy means, so that, after long contests in the papal court, a decision was pronounced against the Jesuits, and their connection with Madura was dissolved in the middle of the 18th century.

For a long period after the Reformation, the Protestant Church seems to have been little sensible of the duty of labouring for the propagation of Christianity; nor was it until the present century that missionary zeal began to be largely developed. In the middle of the 17th c. (1647), indeed, an act of the English parliament established the *Society for Propagating the Gospel in Foreign Parts*, and at the close of the century (1698), the *Society for Promoting Christian Knowledge* was established. A few missionaries laboured with zeal and success among the North American Indians, in which field the names of Eliot and Mayhew are particularly distinguished in the 17th c., and that of Brainerd in the 18th; but the commencement of more systematic and continuous missionary enterprise may be reckoned from the establishment of the first Protestant mission to India, which did not take place till the beginning of the 18th c., when Bartholomew Ziegenbalg and another were sent thither

by Frederick IV. of Denmark, and settled in a small territory then belonging to Denmark on the coast of Coromandel. The mission in the south of India soon received the support of the *English Society for Promoting Christian Knowledge*, and was maintained and extended chiefly by that Society during the whole of the 18th century. Amongst the missionaries who laboured in this field, the name of Swartz is particularly distinguished; and the success which attended his exertions, and the influence which he acquired in the country, were equally remarkable. He died in 1798. Since that time, the missionary work in the south of India has been carried on with continued success, and by the missionaries of a number of societies. Greater progress has been made there than in any other part of India, nor, indeed, was the work commenced in any other part of India till almost a century later.—The Moravian Church early entered upon missionary enterprise, and was the first Protestant Church which did so in its united or corporate character; and very successful missions of the United Brethren were planted in the 18th c. at the Cape of Good Hope, in the West Indies, and in Labrador. Greenland had previously been made the field of similar enterprise by missionaries from Norway. The mission to Greenland was founded by Hans Egede (q. v.) in 1721, and has been maintained to the present day. Its success has been such, that the greater portion of the Greenlanders have now been converted to Christianity, and much of the rudeness of their former manner of life has disappeared.—Towards the close of the 18th c., some of the great missionary societies still existing in England were formed.—the *Baptist Missionary Society* in 1792, the *London Missionary Society* in 1795. About the same time, the *British and Foreign Bible Society*, and the *Religious Tract Society*, were formed, which have co-operated with all the missionary societies as most important auxiliaries. The *Baptist Missionary Society*, immediately after its formation, sent missionaries to the north of India. Dr Carey was one of its first, and also one of its most eminent missionaries. India is now a field of labour for many missionary societies, not only of Britain, but also of America and of the continent of Europe. The *London Missionary Society* sent its first missionaries to the South Sea Islands, and the mission was maintained for about 16 years, amidst many difficulties, without any apparent success; but its success was afterwards great and rapid, first in Tahiti, and afterwards in other islands, so that now many of the islands of the South Seas are entirely Christian. The *London Missionary Society* soon entered also upon other fields of labour, and now maintains missions to many parts of the world. It was at first composed of members of almost all Protestant denominations; but the formation of other societies, and the engagement of churches as such in missionary enterprise—as the Wesleyan Methodist Church, the Church of Scotland, &c.—have left this Society now in a great measure to the English Independents. Since the commencement of the present century, a number of missionary societies have been formed in Britain, of which the *Church Missionary Society*, formed by members of the Church of England, is one of the most important, and has sent forth missionaries to many fields. Their labours have been particularly successful in New Zealand, in the west of Africa, and in the vicinity of Hudson's Bay. They recently occupied Abyssinia as a field of missionary labour, and their missionaries have contributed much to our knowledge of the eastern and central parts of Africa; whilst the late Dr Livingstone, a missionary of the *London Missionary Society*, with a primary regard to the extension of missions,

## MISSIONS—MISSISSIPPI.

explored a vast and previously unknown region in the south. His more recent explorations, only terminated by his death, were all carried on with the same end. The Wesleyan Methodists have planted their missions in many parts of the world. They have been particularly successful in the Fiji Islands, and in some parts of the west of Africa.—The American Board of Commissioners for Foreign Missions was formed in 1810, and was soon followed by other missionary societies in America, some of which rival those of Britain in magnitude and importance. One of the first enterprises of the American Board was the mission to the Sandwich Islands, founded in 1819, which has resulted in the general Christianisation of these islands, and in their civilisation to a degree which, considering the shortness of the time, may well be regarded with admiration. The American Baptist Missionary Society has occupied Sumatra and the Eastern Peninsula as one of its principal spheres of labour, and there its missionaries have enjoyed remarkable success in the Christianisation and civilisation of the people called Karens. Protestant missionary societies have also been formed on the continent of Europe, of which the first was that of Basel, in 1816, and the next was that of Berlin, in 1823; and some of these have also maintained successful missions in heathen countries. The instances of most marked and extensive success of missions are those which have been already noticed, and that of Madagascar, where missionaries of the London Missionary Society enjoyed the protection and favour of King Radama I., and the church planted by them continued to exist, notwithstanding severe persecution, and the martyrdom of not a few of its members, during the next reign, and is a wonderfully flourishing church at the present day. In the south of Africa, also, important results have been obtained. Access has recently been obtained to China, and a number of Protestant churches and societies have entered energetically upon that field. Preparation had been previously made for this, by missionary labours amongst the Chinese in the Eastern Peninsula, and by the study of the language, the compilation of grammars and dictionaries, and the translation of the Bible into the Chinese language. Indeed, it must be reckoned as among the services rendered to mankind by Christian missionaries in modern times, that they have not only translated the Bible and other religious books into many languages, but have reduced many barbarous tongues to writing, and have prepared grammars and dictionaries, thereby contributing not a little, independently of their highest aim, to the promotion of knowledge, civilisation, and the welfare of the human race.

The progress of Christian missions to Mohammedan countries has hitherto been very small, although numerous converts from Mohammedanism, as well as from heathenism, have been made in India. Of late, some have thought they observed a movement among the Mohammedans of India, apparently tending towards Christianity; but at the same time there has been a new awakening of Mohammedanism itself in the Eastern Peninsula and the islands of the Malay Archipelago. Missions to the Jews have for more than 20 years engaged not a little of the attention of some portions of the Christian Church, particularly in England and Scotland. Missions have been planted in places where Jews are numerous, and already with considerable success.

**MISSISSIPPI**, one of the south-western United States of America, lies in lat. 30° 13'—35° N., and long. 88° 7'—91° 41' W. It is 332 miles from north to south, and from 78 to 118 miles from east to west, containing an area of 47,156 square miles. It

is bounded N. by Tennessee, E. by Alabama, S. by the Gulf of Mexico and East Louisiana, and W. by the rivers Pearl and Mississippi. The state also includes a cluster of islands in the Gulf, of which the principal are Horn, Deer, and Ship Islands. There are 60 counties. The principal towns are Jackson (the capital), Natchez, Vicksburg, and Columbus. There are 83 miles of sea-coast, but no good harbours. The surface is undulating, and generally very fertile, with river-bottoms of great productiveness. The sea-coast is sandy, but well timbered with live oak, magnolia, and pine, and is considered one of the most healthy districts in the world. The state borders for 500 miles on the Mississippi, and is drained by its tributaries, the Yazoo, Black, Sunflower, &c., and by the Pearl and Pascagoula, flowing into the Gulf of Mexico. The country is of the Tertiary and Upper Secondary formations, with great alluvial valleys; the climate semi-tropical; the chief productions, cotton, sugar, maize, wheat, sweet potatoes, peaches, figs, oranges, &c. In its forests are found the deer, puma, bear, wolf, wild-cat, parquets, wild turkeys, and pigeons, with fish and alligators in the rivers. The state is well provided with railways, and has immense wealth and resources. In 1860, with a population of 791,305, it produced 481,000,000 lbs. of cotton, and 29,000,000 bushels of Indian corn. In 1870, there were 1 university, 4 colleges, an agricultural college, an institution for deaf-mutes and the blind, also a lunatic asylum. This region was traversed by De Soto in 1542. La Salle descended the Mississippi in 1682, and claimed the country for France; in 1698, M. d'Iberville formed settlements on the coast at Ship Island and Biloxi. Natchez was settled in 1700; but in 1728 this settlement was destroyed by the Natchez tribe of Indians, who were afterwards defeated, and the survivors sold into slavery in St Domingo. M. was admitted to the Union in 1817; it seceded in 1861, and joined the Southern Confederacy. In 1863, the city of Vicksburg, after a long and gallant defence, was forced, by famine, to surrender to General Grant; and Jackson, the capital, was taken, and partially destroyed by the Federals, and some of the finest regions of the state laid waste. Pop. (1860) 791,305, of which the slaves numbered 436,696; (1870) 827,922, no slaves.

**MISSISSIPPI** (Indian, *Miche Sepe*, Great River, literally, Father of Waters), a river of the United States of America, the principal river of North America, and, including its chief branch, the Missouri, the longest in the world, rises in the highlands of Minnesota, in a cluster of small lakes, and near the sources of the Red River of the North, and the rivers which flow into Lake Superior, in lat. 47° 10' N., long. 94° 54' W. Its sources are 1680 feet above the Gulf of Mexico, into which it enters. Its general course is southerly, with numerous windings, giving it a length of 2986 miles to its mouth, in lat. 29° N., long. 90° W., from which, to the source of the Missouri, is 4506 miles. The M. and its branches drain an area of 1,226,600 square miles. It is navigable to the Falls of St Anthony, 2200 miles, and by smaller boats above the falls; or by the Missouri, 3950 miles, and has 1500 navigable branches, the chief of which are the Red River, 340 miles from its mouth; the Yazoo, 534 miles; the Arkansas, 700 miles; the Ohio, 1053 miles; the Missouri, 1253 miles. The M. River forms a portion of the boundaries of ten states, having the southern part of Minnesota, Iowa, Missouri, Arkansas, and most of Louisiana on the west bank; and Wisconsin, Illinois, Kentucky, Tennessee, and Mississippi on the east. The chief towns situated on its banks are New Orleans,

then comes in sudden gusts, struggling with the local aerial currents, but its fast increasing violence soon overcomes all opposition. In a few hours, it has dried up the soil, dispersed the vapours of the atmosphere, and raised a dangerous tumult among the waters of the Mediterranean. The Mistral blows with its greatest force from the end of autumn to the beginning of spring, and causes much damage to the fruit-trees in blossom, and often to the field-crops. It is a terror to the mariners of the gulfs of Lyon and Valence, and even the most hardy seaman makes all haste to a harbour of refuge. The most probable cause of the Mistral is the derangement of atmospheric equilibrium produced by the cold condensed air of the Alps and Cevennes rushing in to supply the vacuum produced by the expansion of the air in the warm southern provinces of France, and on the surface of the Mediterranean. This wind is very appropriately denominated by the Italians *Maestro*.

**MISTRETTA**, a town of the island of Sicily, 67 miles west-south-west of Messina, capital of a district. Pop. 8400. It occupies a healthy situation near the northern coast, in the vicinity of the river Nebroden.

**MITAKSHARĀ** is the name of several commentatorial works in Sanscrit, for instance, of a commentary on the text-book of the Vedānta philosophy, of a commentary on the Mīmāṃsā work of Kumārila, of a commentary on the Brāhadāraṇyaka (see VEDA), &c. The most renowned work, however, bearing this title is a detailed commentary by Vijnānes'wara (also called Vijnānanātha), on the law-book of Yājñavalkya (q. v.); and its authority and influence are so great that 'it is received in all the schools of Hindu law from Benares to the southern extremity of the peninsula of India as the chief groundwork of the doctrines which they follow, and as an authority from which they rarely dissent' (cf. two treatises on the Hindu Law of inheritance, translated by H. T. Colebrooke, Calcutta, 1810). Most of the other renowned law-books of recent date, such as the *Smṛiti-Chandrikā*, which prevails in the south of India, the *Chintāmanī*, *Vīramitrodaya*, and *Mayūkha*, which are authoritative severally in Mithilā, Benares, and with the Mahrattas, generally defer to the decisions of the M.; the *Dāyabhāga* of Jimūtvāhana alone, which is adopted by the Bengal school, differs on almost every disputed point from the M., and does not acknowledge its authority. The M., following the arrangement of its text-work, the code of Yājñavalkya, treats in its first part of duties in general; in its second, of private and administrative law; in its third, of purification, penance, devotion, and so forth; but, since it frequently quotes other legislators, expounding their texts, and contrasting them with those of Yājñavalkya, it is not merely a commentary, but supplies the place of a regular digest. The text of the M. has been edited several times in India. An excellent translation of its chapter 'On Inheritance' was published by Colebrooke in the work above referred to; and its explanation of Yājñavalkya is followed by the same celebrated scholar in his *Digest of Hindu Law* (3 vols. Calcutta and London, 1801), when translating passages from this ancient author.

**MITE**, a name sometimes given to the *Acarides* generally (see ACARUS); sometimes only to those of them which have the feet formed for walking, and the mouth not furnished with a sucker formed of lancet-like plates, as in the Ticks (q. v.), but with mandibles. All of them are small creatures; the species are very numerous; they feed chiefly on decaying animal and vegetable substances, or are

parasitical on quadrupeds, birds, and insects. The **CHEESE M.** (*Acarus domesticus*, figured in the article ACARUS) is one of the best known species; another is the **FLOUR M.** (*A. farinae*), too common among flour, in both of which the body is covered with hairs very large in proportion to its size, and capable of a considerable amount of motion. The **SUGAR M.** (*A. saccharinus*) swarms in almost all soft sugar; but refined and crystallised sugar seems to defy its mandibles, and is free of it. The surface of jelly and preserves, when it has begun to become dry, is often covered with multitudes of very small mites. A species of M. is the cause of Itch (q. v.), and many of the lower animals are infested by parasites of this tribe. Beetles may often be seen absolutely loaded by a species which preys on them; and bird-fanciers regard with the utmost horror the **RED M.**, which lurks in crevices of cages and aviaries, and sucks the blood, and eats the feathers of their inmates.

**MITFORD, MARY RUSSELL**, a well-known English authoress, was the only child of a physician, and was born at Alresford, Hants, December 16, 1786. At the age of ten, she was sent to a boarding-school at Chelsea, and also placed under the guidance and tuition of a Miss Rowden, a lady of a literary turn, who had already educated Lady Caroline Lamb, and was destined to be the instructress of Miss Landon and of Fanny Kemble. During the five years she spent here, she read with avidity, studying the tragic authors of France, Shakspeare, and the early dramatists of England. At the age of fifteen, she returned home, and before she was twenty, she published three volumes of poetry. These having been severely castigated by the *Quarterly Review*, she applied herself to writing tales and sketches for the magazines. The profession she had adopted from taste she was obliged to continue from necessity, for the spendthrift habits of her father, a good-natured but careless gentleman, had exhausted a competent fortune, and left him dependent on his daughter. The first volume of *Our Village* appeared in 1824, and the series of five volumes was completed in 1832. Of the more important of her dramatic works, *Julian* was first performed in 1823; the *Foscari* in 1826; and *Rienzi* in 1828—all of them, and especially the last, with success. Among her other important works, are *Recollections of a Literary Life* (3 vols. 1852); *Atherton* (a novel, 3 vols. 1854) and *other Tales*; and in 1854, she also published a collected edition of her Dramatic Works, in two volumes. In 1838, she received a pension from government, but neither this nor the growing ill-health of her later years, induced her to relax her literary industry. She died at her residence, Swallowfield Cottage, near Reading, January 10, 1855.

Successful both as a compiler and an author, Miss M. has produced many interesting volumes; but her fame—if the admiring respect for an amiable lady and a woman of graceful literary genius may be so called—rests chiefly on the sketches of country life which compose *Our Village*. These sketches are chiefly memorable for their style, which, if not witty, is vivacious, genial, and humorous; the outcome at once of a good heart, an active brain, and a fine fancy.

**MITFORD, WILLIAM**, was born in London, February 10, 1744, and studied at Queen's College, Oxford, but left the university without taking his degree. In 1761, he succeeded to the family estate; and in 1769, became a captain in the South Hampshire Militia, in which capacity he made the acquaintance of Gibbon, then a major of the same,

# MITHRAS—MITHRIDATES.

by whose advice and encouragement he was induced to undertake a history of Greece. M.'s first work, entitled *An Inquiry into the Principles of Harmony in Languages, and of the Mechanism of Verse, Modern and Ancient*, appeared in 1774; but by far his most important publication was his *History of Greece*, the first volume of which appeared in 1784, and the last in 1818. It is a pugnacious, opinionative, one-sided, and even fanatical production. The author is an intense hater of democracy, and can see in Philip of Macedon nothing but a great statesman, and in Demosthenes, nothing but an oratorical demagogue. Yet his zeal, which so often led him astray, also urged him, for the very purpose of substantiating his views, to search more minutely and critically than his predecessors into certain portions of Greek history, and the consequence was that M.'s work held the highest place in the opinion of scholars until the appearance of Thirlwall and Grote. He died February 8, 1827.

**MITHRAS** (cf. Sanscrit *Mitram*, friend), the highest of the twenty-eight second-class divinities of the ancient Persian Pantheon, the *Ised* (Zend. *Yazata*) or Genius of the Sun, and ruler of the universe. Protector and supporter of man in this life, he watches over his soul in the next, defending it against the impure spirits, and transferring it into the realms of eternal bliss. He is all-seeing and all-hearing, and armed with a club—his weapon against Ahri-man and the evil *Deus*—he unceasingly 'runs his course' between heaven and earth. The ancient monuments represent him as a beautiful youth, dressed in Phrygian garb, kneeling upon an ox, into whose neck he plunges a knife; several minor, varying, allegorical emblems of the sun and his course, surrounding the group. At times, he is also represented as a lion, or the head of a lion. The most important of his many festivals was his birthday, celebrated on the 25th of December, the day subsequently fixed—against all evidence—as the birthday of Christ. The worship of M. early found its way into Rome, and the mysteries of M. (*Hierocoronica*, *Coracica Sacra*), which fell in the spring equinox, were famous even among the many Roman festivals. The ceremonies observed in the initiation to these mysteries—symbolical of the struggle between Ahri-man and Ormuzd (the Good and the Evil)—were of the most extraordinary and to a certain degree even dangerous character. Baptism and the partaking of a mystical liquid, consisting of flour and water, to be drunk with the utterance of sacred formulas, were among the inaugural acts. The seven degrees—according to the number of the planets—were, 1. Soldiers: 2. Lions (in the case of men), or Hyænas (in that of women): 3. Ravens: 4. Degree of *Perses*: 5. of *Oromios*: 6. of *Helios*: 7. of Fathers—the highest—who were also called Eagles and Hawks. At first, of a merry character—thus the king of Persia was allowed to get drunk only on the Feast of the Mysteries—the solemnities gradually assumed a severe and rigorous aspect. From Persia, the cultus of M. and the mysteries were imported into Asia Minor, Syria, Palestine, &c., and it is not unlikely that in some parts human sacrifices were connected with this worship. Through Rome, where this worship, after many vain endeavours, was finally suppressed in 378 A.D., it may be presumed that it found its way into the west and north of Europe; and many tokens of its former existence in Germany, for instance, are still to be found, such as the M. monuments at Hedernheim, near Frankfurt-on-the-Maine, and at other places. Among the chief authorities on this subject are Anquetil du Perron, Creuzer, Silvestre de Sacy, Lajard, O. Müller (*Denkmäler d. alten Kunst*). See GÜEBRES, PARSEES, ZENDAVESTA.

**MITHRIDATES** (more properly, MITHRADATES, a name formed from the Persian *Mithras*, or *Mithra*, 'the sun,' and an Aryan root *da*, to give; hence 'sun-given' or 'sun-born' prince), the name of several kings of Pontus, Armenia, Commagene, Parthia, and the Bosphorus, all of whom have sunk into insignificance, with the exception of M. VI. of Pontus, surnamed EUPATOR and DIONYSUS, but more generally known as M. THE GREAT. Little is known of his early career. He succeeded his father, probably about 120 B. C., while under 13 years of age, and soon after subdued the tribes who bordered on the Euxine, as far as the Chersonesus Taurica (Crimea), and after the death of Parysatis, incorporated the kingdom of the Bosphorus with his dominions. The jealous behaviour of the Romans, and the promptings of his own ambitious spirit, now incited him to invade Cappadocia and Bithynia, but a wholesome fear of the power of the Great Republic induced him to restore his conquests. The *First Mithridatic War* was commenced by the king of Bithynia (88 B. C.), who, at the instigation of the Romans, invaded Pontus. M. sent an ambassador to Rome to complain of this treatment, but he was sent back with an evasive reply. M. immediately commenced hostilities, and his generals repeatedly defeated the Asiatic levies of the Romans, and he himself took possession of Bithynia, Cappadocia, Phrygia, and the Roman possessions in Asia Minor, the inhabitants of which last hailed him as a deliverer. By his orders, a great massacre of the Romans took place, in which, according to one account, 80,000, and according to another, 150,000 were slain. He also sent three powerful armies to aid the Greeks in their rebellion, but the disastrous battles of Chæronea and Orchomenus broke his power in that country. He was, however, driven from Pergamus (85 B. C.) by Flavius Fimbria, and reduced to the necessity of making peace with Sulla, relinquishing all his conquests in Asia, giving up 70 war-galleys to the Romans, and paying 2000 talents. The wanton aggressions of Murena, the Roman legate, gave rise to the *Second Mithridatic War*, in 83 B. C. M. was wholly successful in this war, but peace was concluded on the *status quo*, 81 B. C. M. felt, however, that this was merely a truce, and lost no time in preparing for a third contest, in alliance with Tigranes, king of Armenia, the next most powerful monarch of Asia. Tigranes seized Cappadocia, 76 B. C., and M., in the following year, invaded Bithynia, commencing the *Third Mithridatic War*. M. formed an alliance with Sertorius (q. v.), and obtained the services of Roman officers of the Marian party, who trained his army after the Roman manner. The arms of M. were at first successful; but afterwards the Roman consul Lucullus (q. v.) compelled him to take refuge with Tigranes, 72 B. C. Lucullus then conquered Pontus, defeated Tigranes, 69 B. C., at Tigranocerta, and both Tigranes and M. at Artaxata, 68 B. C. M., however, recovered possession of Pontus. After the war had lingered for some time, Cneius Pompeius (see POMPEY), completed the work of Lucullus, 66 B. C., defeating M. on the Euphrates, and compelling him to flee to the Bosphorus. Here his indomitable spirit prompted him to form a new scheme of vengeance, which was, however, frustrated by the rebellion of his son, Pharnaces, who besieged him in Panticapæum. Deeming his cause hopeless, M. put an end to his own life, 63 B. C. M. was a specimen of the true eastern despot, but he possessed great ability, and extraordinary energy and perseverance. His want of success was owing not to his defects as a general, but to the impossibility of raising and training an army capable of coping with the Roman legions, and his

## MITRE—MITYLENÉ.

system of tactics during the third Mithridatic war plainly shews his thorough conviction of this fact. He had received a Greek education at Sinope, could speak no less than 25 different languages and dialects, and possessed considerable love for the arts, of which his magnificent collections of pictures, statues, and engraved gems were a proof. In the estimation of the Romans, he was the most formidable opponent they ever encountered, and occasional reports of his various successes spread the utmost terror among them.

**MITRE**, the point or line of union of mouldings meeting at an angle.

**MITRE** (Lat. *mitra*, also *infula*), the head-dress worn in solemn church services by bishops, abbots, and certain other prelates in the Western Church. The name, as probably the ornament itself, is borrowed from the orientals, although, in its present form, it is not in use in the Greek Church, or in any other of the churches of the various eastern rites. The western mitre is a tall, tongue-shaped cap, terminating in a twofold point, which is

Mitre.

supposed to symbolise the 'cloven tongues,' in the form of which the Holy Ghost was imparted to the apostles, and is furnished with two flaps, which fall behind over the shoulders. Opinion is much divided as to the date at which the mitre first came into use. Eusebius, Gregory of Nazianzus, Epiphanius, and others speak of an ornamented head-dress, worn in the church; but there is no very early monument or pictorial representation which exhibits any head-covering at all resembling the modern mitre. From the 9th c., however, it is found in use, although not universally; and instances are recorded in which the popes grant permission to certain bishops to wear the mitre; as, for example, Leo IV. to Anshar, Bishop of Hamburg, in the 9th century. The material used in the manufacture of the mitre is very various, often consisting of most costly stuffs, studded with gold and precious stones. The colour and material differ according to the festival or the service in which the mitre is used, and there is a special prayer in the consecration service of bishops, used in investing the new bishop with his mitre. The mitre of the pope is of peculiar form, and is called by the name *Tiara* (q. v.). Although the mitre properly belongs to bishops only, its use is also permitted by special privilege to certain abbots, to provosts of some distinguished cathedral chapters, and to a few other dignitaries. See Binterim, *Denkwürdigkeiten der Kirche*, 1 B. 2 Th., p. 348.

The mitre, as an ornament, seems to have descended in the earliest times from bishop to bishop. Among the Cottonian MSS., is an order, dated 1st July, 4 Henry VI., for the delivery to Archbishop Chicheley of the mitre which had been worn by his predecessor. It was in some cases a very costly ornament. Archbishop Pecheham's new mitre, in 1288, cost £173, 4s. 1d. In England, since the Reformation, the mitre is no longer a part of the episcopal costume, but it is placed over the shield of an archbishop or bishop, instead of a crest. The mitre of a bishop has its lower rim surrounded with a fillet of gold; but the Archbishops of Canterbury and York are in the practice of encircling theirs with a ducal coronet, a usage of late date and doubtful propriety. The Bishop of Durham

surrounds his mitre with an earl's coronet, in consequence of being titular Count Palatine of the Rhine and Earl of Sedburgh. Before the custom introduced of bishops impaling the insignia of sees with their family arms, they sometimes encircled their paternal coat by the addition of a Mitre, which is now rare as a charge in heraldry, but sometimes borne as a crest, particularly in Germany, to indicate that the bearers were feudatories or dependents of ancient abbeys.

**MITSCHERLICH**, EILHARD, a distinguished Prussian chemist, was born at Neuende, near Berlin in 1794, and died at Berlin in 1863. In 1813 he proceeded to the university of Heidelberg, where he devoted himself to history, philology, oriental languages; and he continued the study of these subjects at Paris and Göttingen. It is not till 1818, when he was at Berlin, that he made chemistry as his special study. His observations on the striking similarity between the crystalline form and the chemical composition of the arsenates and the phosphates, led to his discovery of the law of Isomorphism (q. v.), the importance of which was so fully recognised by Berzelius, that he invited the young chemist, in 1819, to Stockholm, where he studied till 1821, when, on the death of Klaproth, he was, on the strong recommendation of Berzelius, appointed to the vacant chair of chemistry at Berlin. One of his earliest discoveries after his appointment was that of the double crystalline form of arsenic, the first observed case of Dimorphism. See DIMORPHISM. His investigations regarding the formation of artificial minerals, and his memoirs on Benzoin, on the Formation of Ether must be classed as his most important contributions to chemistry. It is mainly on the discovery of Isomorphism and Dimorphism that his reputation will finally rest. His principal work is his *Lehrbuch der Chemie*, begun in 1829, and concluded in 1841. It has passed through five editions, and is especially valuable for the clear and simple way in which he has brought mathematics and physics to bear upon the subject. He was an honorary member of almost all the great scientific societies, and received the gold medal from the Royal Society of London for his discovery of the law of Isomorphism.

**MITTAU**, or **MITAU**, the chief town of the government of Courland, in European Russia, situated on the right bank of the Aa, 25 miles south-west of Riga, and was founded in 1262 by the grand master of the Teutonic Knights. It was annexed to Russia in 1795. Pop. 23,100, the greater part of whom are Germans by birth or descent, 11,000 Jews, and only a few Russians. The town is entirely built, the houses being chiefly of wood painted of a green or brown colour. The important buildings are the old castle—now the seat of the governor of the province—four churches, an astronomical observatory, a public library, a museum, and a number of educational and charitable institutions. As regards commerce and industry, the town occupies only the third place in the government, its principal product being artichokes, japanned iron and tin; there is an export of hemp, flax, and corn. M. is the winter residence of the gentry of the surrounding country, and for some time the abode of Louis XVIII.

**MITTIMUS**, an English law-term for a writ, by which a record is transferred out of one court to another.

**MITYLENÉ**. See **LESBOS**.

## MIXED MARRIAGES—MIXED RACES.

**MIXED MARRIAGES.** In various countries of Europe, marriages between persons of different religious belief have either been prohibited or put under restrictions. The canon law forbade marriages between Christians and non-Christians; at one time, it merely discouraged, at another altogether prohibited the marriage of orthodox Christians with heretics. Subsequently to the Reformation, papal dispensations were in use to be granted for marriages between Catholics and Protestants, with the condition annexed, that the children should be brought up in the Catholic faith. During the latter part of the 17th c., parents seem to have been left at liberty to make what agreement they pleased on this head; and in default of their making any, it was presumed that the children would follow the religion of their father. In the middle of the 18th c., the validity of mixed marriages, even when celebrated by the civil magistrate, was recognised by the papal court; and under Napoleon's rule, they became common, without stipulations as to the children. The events of 1815 restored sufficient influence to the Roman Catholic Church, to enable the clergy to put in force a rule by which they could refuse to celebrate such marriages without an assurance that the children would be brought up Catholics. By the law of many of the German states, the clergyman of the bride was the only person who could competently officiate, and an engagement of this kind was often not only repugnant to the father as a Protestant, but illegal. Conflicts followed between the civil and ecclesiastical authorities, which have sometimes been obviated by the priest, on whom the law imposes the celebration of the marriage, not pronouncing the nuptial benediction, but giving his presence as a witness along with two other witnesses when the parties declared themselves husband and wife—a kind of marriage whose validity is perfectly recognised by the canon law. In Spain, marriages between Catholics and Protestants have sometimes taken place in this way, avoiding the stipulations otherwise necessary regarding the children.

There is a great diversity in the present state of the law of mixed marriages in different parts of Germany. The restrictions which, till lately, existed in Prussia, have been done away with by the very recent recognition of a civil ceremony alone as that which constitutes marriage in the eye of the law. Until that change, the letter of the law provided that the children should be brought up in the faith of their father, and no compacts to the contrary were allowed. Practically, however, the law was largely evaded, no one having a recognised interest to object to the fulfilment of such agreements. In Bavaria, mixed marriages may be performed either by Protestant or Catholic clergymen; and the spouses have it in their power to make what arrangements they please regarding the children before or after marriage; but if no such arrangements happen to have been made, the children are brought up in the religion of their father. In Saxony, and various other German states, the spouses may, before marriage, make what arrangements they like as to the religion of their children; but if they have made none, the law obliges them to be brought up in the faith of their father. At present (1874), these questions are in a transitional phase, owing to the complications which have arisen between the government and the Catholic bishops and clergy who adhere to the syllabus, and an attempt is being made by a bill now before the Reichstag to make civil marriage the law of the whole empire. Should these changes be carried out, it is understood the question regarding the religion in which the children are to be educated

will no longer be cognisable by the civil tribunals. In Austria, the interposition of the Catholic priest is required in marriages between Catholics and Protestants. He need not, however, give the sacerdotal benediction; his passive assistance only is required, either in taking the declaration of the parties, which is followed by a Protestant ceremony, or by being present as a witness at the Protestant ceremony. When the husband is Catholic, all the children must be brought up Catholics; when the husband is Protestant and the wife Catholic, the sons follow the father and the daughters the mother. In Denmark, stipulations may be made before or after marriage, and can be altered by mutual consent of the parents, or, in some cases, even after the death of one of them. Mixed marriages were, till lately, altogether prohibited in some of the Catholic cantons of Switzerland, but they are now authorised in all the cantons by the federal laws. It is generally the clergyman of the husband's creed who officiates, but at Zürich the ceremony is performed in both churches. In most cases, the children are required to be educated in the religion of their father.

In most German states, marriages between Christians and Jews or Mohammedans are interdicted; but since 1849, the prohibitions have in individual cases been dispensed with. In Denmark, such marriages have been permitted, on condition of the children being brought up Protestants. In Russia, the members of both Greek and Roman communions are prohibited from intermarrying with non-Christians: members of the orthodox Greek Church cannot marry Greek sectaries; but when an orthodox Russian marries a Protestant or Catholic, the benediction must be given in the Greek Church, and the children baptized in the Greek communion. When the parents are of different religions, but neither belongs to the Greek Church, ante-nuptial stipulations will be given effect to; if none have been made, the sons follow the father's faith, the daughters the mother's.

In France, the law regards marriage as a purely civil contract, and recognises only the civil celebration, which is completely separated from the religious rite. As the faith of the parents is not taken cognizance of, questions regarding the religious education of the children cannot arise before the civil tribunals.

The only restriction to which mixed marriages are now subjected in any part of the United Kingdom is imposed by act 19 Geo. II. c. 13, applicable to Ireland only, that a marriage celebrated by a Catholic priest between a Roman Catholic and a Protestant, or a person who within twelve months has been or professed to be a Protestant, or between two Protestants, is null.

**MIXED RACES.** The subject of *mixed races* is one intimately connected with an enlarged study of ethnology. It involves a consideration of the phenomena attendant upon the sexual union between individuals belonging to different varieties of the human race; as, for instance—adopting the classification of Blumenbach—between the European and the negro or the American Indian; or between the American Indian and the negro; or between any of these three and individuals belonging to the Malay and Mongolian varieties. It is understood that such unions are in general and not only so, but that their offspring prolific; and this fact is much relied upon by ethnologists, as an argument in favour of the human race. They reason thus: different varieties of mankind distinct has been frequently alleged, then it would follow that the offspring of such unions

as unfruitful as those between the horse and the ass, the goat and the sheep, the wolf and the dog; and similarly with respect to the hybrids among birds, insects, and plants. To sum up, in the words of Dr Prichard, the best exponent of this school of ethnology: 'It seems to be the well-established result of inquiries into the various tribes of organised beings, that the perpetuation of hybrids, whether of plants or animals, so as to produce new and intermediate tribes, is impossible. Now, unless all these observations are erroneous, or capable of some explanation that has not yet been pointed out, they lead, with the strongest force of analogical reasoning, to the conclusion, that a number of different tribes, such as the various races of men, must either be incapable of intermixing their stock, and thus always fated to remain separate from each other, or, if the contrary should be the fact, that all the races to whom the remark applies, are proved by it to belong to the same species.' Dr Prichard further observes, that so far from such unions between members of different varieties of the human race proving unfruitful, or their offspring unfruitful, the very opposite is the case, as, for instance, in unions between the negro and the European, the most strongly marked varieties of our race. 'If we inquire,' he says, 'into the facts which relate to the intermixture of negroes and Europeans, it will be impossible to doubt the tendency of the so-called Mulattoes to increase. The men of colour, or the mixed race between the Creoles and the negroes, are in many of the West India Islands a rapidly increasing people, and it would be very probable that they will eventually become the permanent masters of those islands, were it not for the great numerical superiority of the genuine negroes. In many parts of America, they are also very numerous.' It is to America, indeed, both north and south, that we must chiefly look for the numerous and varied phenomena resulting from this intermixture of races; for there we have not only the negro and the European mingling their blood, but the negro and the American Indian, the European and the Indian, and the offspring of each of these with the offspring of the other, or with members of either of the parent stocks; added to which, of late years, the Chinese (of Mongolian race or variety) have appeared upon the scene, thus contributing greatly to the number of what are termed *human hybrids*. All these, however, are not equally fertile; and with respect even to the Mulattoes, it is alleged by writers of the Morton school of ethnology that they do not perpetuate themselves for many generations. 'Nature,' says Squier, rather dogmatically, 'perpetuates no human hybrids—as, for instance, a permanent race of Mulattoes.' And Dr Nott, adopting the classification of species laid down by Dr Morton—namely, *Remote Species*, in which hybrids are never produced; *Allied Species*, which produce, *inter se*, an unfertile offspring; and *Proximate Species*, which produce with each other a fertile offspring—is of opinion that it is only by the union of southern or dark-skinned Europeans with negroes that thoroughly prolific Mulattoes are engendered, which is not the case in unions occurring between individuals of the Anglo-Saxon and negro races. In arriving at this conclusion, we cannot help thinking that the author has been helped forward by the strong prejudice existing in the Southern States against all taint of negro blood. A more impartial writer, Professor Wilson, in his *Prehistoric Man*, observes: 'There are upwards of four millions of people of African blood in the United States, and certainly not less than ten millions throughout the continent and islands of North and South America, and

of these the larger proportion consists of hybrids. . . . It is impossible to determine with certainty how far the hybrid coloured population of the United States is capable of permanency, either by the development of a fixed hybrid type, or by continuous fertility, until the predominant primary type reasserts its power, by their return to that of the original white or black parent, so long as the mixed breed is constantly augmented in the Southern States by means at variance with the natural and moral relations of social life.' As it is, the weight of evidence appears to be in favour of Dr Prichard's view; but until the doctrine of hybridity is better understood, and a more satisfactory answer to the vexed question, 'What is species?' has been supplied to us, we must deem it idle to pronounce dogmatically on the subject. See HYBRID and SPECIES. We conclude with a list of half-castes given by Dr Tschudi, with a few additions from other sources, printed in the appendix to Professor Wilson's valuable work just mentioned.

Father.	Mother.	Half-caste.
White.	Negro.	Mulatto.
White.	Indian.	Mestizo.
Indian.	Negro.	Chino.
White.	Mulatta.	Quarteron.
White.	Mestiza.	{ Creole, only distinguished from the white by a pale brown complexion.
White.	Chinese.	Chino-blanc.
White.	Quarterona.	Quintero.

MIXTURES are officinal preparations, extemporaneous in their nature, some of which—as, for example, *Mistura Camphora*, *Mistura Creta*, and *Mistura Ferri Composita*—are very extensively used in medical practice, either as vehicles for more active remedies, or for their intrinsic value.

MI'ZEN, or MIZZEN, the sternmost of the masts in a three-masted vessel, and also the smallest of the three. Above it, are the mizen-topmast, the mizen-top-gallant-mast, and the mizen-royal. It supports the usual yards, and, in addition, the gaff and boom of the Spanker (q. v.). A rear-admiral hoists his pendant at the mizen.

Although the word mizen is now applied adjectively to the several parts, it appears formerly to have been the name of a large triangular sail carried in the stern, and thence to have become the distinguishing title of the mast which bore that sail. The name is probably from It. *mezzano*, mean, in the middle; in opposition to a square sail which lies across the vessel.

MNEMO'NICS. See MEMORY.

MNEMO'SÝNE, in Classical Mythology, the goddess of Memory, and the mother of the nine Muses (q. v.), whom she bore to Jupiter. The principal seat of her worship was at Eleuthera, in Boeotia.

**MOA**, the name given by the New Zealanders to the large wingless or struthious birds (see *BREVI-PESNES*) of which the bones are found imbedded in the sands of the seashore, in swamps, forests, river-beds, and limestone caves, and of which traditions subsist among them as birds living in their country. The largest bones belong to the genus *Dinornis* (q. v.), others to *Palapteryx* (q. v.); and with them are found bones of a large bird (*Aptornis*) resembling a swan, supposed to be now extinct, also of the existing species of *Apteryx* (q. v.) and of *Notornis* (q. v.), much smaller birds. It is generally supposed that no large moas have been seen alive since about 1650; but it has recently been again alleged that some have been seen, and rewards have been offered for the capture of them. They are represented by the New Zealanders as stupid, fat, indolent birds, living in forests, mountain fastnesses, &c., and feeding on vegetable food. Their feet are said to have been adapted for digging. They seem to have been extirpated, or nearly so, for the sake of their flesh, feathers, and bones. The bones were made into fish-hooks, the skulls were used for holding tattooing-powder. The eggs were eaten. The leg-bones of the moas were filled with marrow, and not with air, as those of other birds.

**MOABITES**, a pastoral people, who inhabited the mountainous country east of the lower part of the Jordan and of the Dead Sea. Their *cultus* was characterised by many very odious rites, among which was human sacrifice. In the time of the Judges, the Jews were for eighteen years under the yoke of the M., who were afterwards made tributary by David, but, about 900 B. C., shook off their allegiance to the Jewish kings, and after the Assyrians invaded the land of Judah, took part with the Chaldeans against the Jews. The writings of the prophets are full of denunciations against the Moabites. Their name no longer exists, and the remnants of the people have long been included among the Arabs.

**MOAT**, the ditch round the ramparts of a fortress, may be either wet—i. e., full of water—or dry. In the latter, which is the commoner case, the depth should not be less than 12 feet, nor the width under 24. The more perpendicular the walls, so much the greater will be the obstruction to the enemy. In regular works, the walls are usually revetted with masonry, that at the foot of the rampart being the scarp or escarp, and that below the covered way the counterscarp. Further particulars relative to the moat and its extreme importance will be found under *DITCH* and *FORTIFICATION*.

**MOBILE**, the principal city and only seaport of Alabama, United States of America, is situated on the west side of Mobile River, and at the head of Mobile Bay, which opens into the Gulf of Mexico. It is built with broad shaded streets on a sandy plain, rising gradually from the river, with a fine Custom-house and Post-office, City Hall and Market-house, Theatre, Odd Fellows' Hall, Cathedral, 23 churches, 3 orphan asylums, several hospitals, a medical college; and in the suburbs, St Joseph's College (a Jesuit institution), and a Convent of the Visitation, and Academy for Young Ladies. M. has several ship-yards, foundries, and cotton-presses. Its chief business is the export of cotton, brought down the Alabama and Tombigbee rivers, and the Mobile and Ohio Railway. The average export for five years preceding the Civil War was 632,308 bales. Its harbour, defended by Fort Morgan, would be, with a deeper channel, one of the best on the Gulf. Its entire exports, in 1869, were over

20,000,000 dollars. M. was settled by the French in 1702. Pop. in 1870, 32,034.

**MOBILE**, a river and bay of Alabama, United States of America. The river is formed by the confluence of the Alabama and Tombigbee, 50 miles above Mobile, which lies at its mouth. It is a sluggish stream, with low banks, and several channels. The bay is 30 miles from north to south, and 10 or 12 from east to west. The entrance from the Gulf of Mexico, 3 miles wide, is defended by Fort Morgan and Fort Gaines.

**MOBILE**, **MOBILISE**, an adjective and verb, used respectively in regard to continental armies, to designate a state of readiness for taking the field, and the act of making ready for such an operation. The process consists in augmenting a regiment from its peace to its war complement, in calling in men on furlough, in organising the staff of divisions and brigades, constituting the commissariat, medical, artillery, and transport services, and in accumulating provisions and munitions. As the work of mobilising an army causes great and inevitable expense, it is only resorted to when hostilities appear imminent.

**MOBILIER, CRÉDIT**. On the 18th November 1852, the French government sanctioned the statutes of a new bank under the name of the *Société Générale de Crédit Mobilier*. The name was intended as a contrast to the *Sociétés de Crédit Foncier*, which are of the nature of land banks, and advance money on the security of real or immovable property; while the *Crédit Mobilier* proposed to give similar aid to the owners of movable property. The declared object of this bank is especially to promote industrial enterprises of all kinds, such as the construction of railways, sinking of mines, &c. Various privileges were conferred upon it under its charter; in especial, it was allowed to acquire shares in public companies, and to pay the calls made upon it in respect of such shares, by its own notes or obligations; also to sell or give in security all shares thus acquired. The operations of the society were conducted upon a very extensive scale. In 1854, it subscribed largely to the government loan on account of the Russian War, to the Grand Central Railway Company, to the General Omnibus Company of Paris, and to various other important undertakings. The dividend for this year was 12 per cent. In 1855, it lent two sums to the government—the one of 250, and the other of 375 millions of francs. Its operations were vast during this year, and the dividends declared amounted to 40 per cent. The directors had not hitherto availed themselves of their privilege of issuing their own obligations, but this they now resolved on doing. They proposed to issue two kinds—the one at short dates; the other at long dates, and redeemable by instalments. The proposed issue was to amount to 240 millions of francs, but the public became alarmed at the prospect of so vast an issue of paper-money, so that, in March 1856, the French government deemed it necessary to prohibit the carrying out of the proposed scheme. This was a severe blow to the institution. In 1856, its dividends did not exceed 22 per cent.; in 1857, they were only 5 per cent.; in 1859, they rose to 7½ per cent.; in 1860 and 1861, they were 10 per cent. The last dividend (July 1873) was 5 per cent. The shares are 500 francs, and the present (June 1874) market price is 315 francs. The *Crédit Mobilier* has undoubtedly been highly useful in developing the industrial power of France, but its operations have been hazardous, and had they not been checked in time, they would in all probability have ended in disaster.

**MO'CHA**, the most strongly fortified seaport, and once the capital of the province of Yemen, in Arabia. It is situated on the Red Sea, at the head of a little bay near the Strait of Bab-el-Mandeb, and 130 miles west-north-west of Aden (q. v.). All round the shore is a hot sandy waste. The principal trade is in coffee, of which 10,000 tons (of the finest quality) are annually exported to Jiddah, Seer, and Bombay. Other exports are dates, gums, balm, ivory, senna, &c. Pop. 5000.

**MOCHA STONES** are pieces of agate or of chalcedony, containing dendritic infiltrations, often assuming appearances very like finely ramified conifers, &c. They receive the name Mocha Stone because, when they first became known in Europe, they were brought from Mocha. Of the same nature with M. S. are *Moss Agates*. The resemblance of the enclosed infiltrations to plants is often merely accidental, but it appears to be sometimes really due to plants, which were enclosed in the cavity in which the silicious mineral itself was formed.

**MO'CKING-BIRD, or MOCKING-THRUSH** (*Mimus* or *Orpheus*), a genus of birds of the family *Merculidae*, having a more elongated form than the true thrushes, a longer tail, shorter wings, and the upper mandible more curved at the tip. They are all American. The best known species, the M. of the United States (*M. polyglottus*), is about the size

Mocking-bird (*Mimus polyglottus*).

of the song-thrush; the upper parts of a dark brownish ash colour, the wings and tail nearly black, the under parts brownish white. The M. is common in almost all parts of America, from the south of New England to Brazil; north of the Delaware, it is only a summer visitant, but in more southern regions it is found at all seasons. It is one of the most common birds of the West Indies, and its exquisite song fills their groves with melody by night, for which reason it is there very generally known as the Nightingale. By day, the M. is generally imitative, excelling all birds in its power of imitation, now taking up the song of one bird, and now of another, and often deceiving the most practised ear by its perfect performance. By night, its song is for the most part natural. It does not confine itself, however, to musical strains; it seems to take equal pleasure in repeating the harshest cries of the feathered tribes; and in domestication readily adds to its accomplishments the imitation of almost any sound which it is accustomed to hear, passing from one to another with great rapidity, so as to produce an incomparable medley. The M. readily learns to whistle a tune, even of considerable length, but there is no well authenticated instance of its imitating the

human voice. The barking of a dog, the mew of a cat, the crowing of a cock, the piping of a hen, the creaking of a wheel-barrow, are all within the compass of its powers. During its performance it spreads its wings, expands its tail, and turns itself about, as if full of enthusiasm and rapture. The M. is vocal at all seasons of the year, and enjoys almost everywhere the protection of man, and often makes its nest in a tree or bush beside a house. Two or three broods are produced in a year. The male is extremely attentive to his mate, and manifests extraordinary energy in driving away enemies from the nest. No birds often assemble on such occasions, but of prey, far superior to them in size and strength, are compelled to retreat. Snakes are killed by reiterated blows on the head, and cats are considered the vicinity of a mocking-bird's nest. The food of the M. consists chiefly of beetles and insects. Another species of M. is found in the Rocky Mountains, and species of the same genus are among the finest song-birds of the temperate parts of South America.

**MODE, in Music.** Every musical passage is referrible to and forms part of a succession of having some appreciable relation to one or more of the notes of the scale. This succession of sounds is called the Scale, a series of steps leading from a given note to the Key-note, or Tonic (q. v.), to its octave. The steps or degrees of the scale are of two kinds, and on the place of the smaller ones or of the larger depends the mode of the music. Taking our

Major Mode.

Minor Mode.

scale, there are only two notes in it which satisfy the ear as key-notes—viz, C and A. In the major mode, with C as key-note, the small interval falls between the third and fourth sounds; in the minor mode, with A as key-note, the small interval falls between the second and third sounds; in the former case, the third of the key-note is a third, in the latter a minor third. The minor mode further requires to be modified by occasionally sharpening its sixth and seventh, in order to be pleasing to modern ears. The scale of the major mode is derived from simpler harmonic principles than that of the minor. Melodies composed in the latter mode have generally more or less of a sad or melancholy character. For the theory of modes, see MUSIC. Ancient musicians admitted of a greater variety of modes. The Greek six, designated the Dorian, Phrygian, Lydian, Mixo-Lydian, Ionic, and Æolian. The latter is the modern major, the Æolian the minor; the others are more or less intolerable to a modern ear. They are used to a limited extent in the music of the Greek Church, and in the Ambrosian Chant.

**MO'DELLING** is the process of preparing an original pattern or design from which a work of sculpture is to be cast or carved: the technical details will be found under SCULPTURE. Modelling is also practised by metallists; the head of a statue intended to be cut in the die being first modelled in relief with wax on a piece of slate. Goldsmiths, and jewellers also model intricate artistic forms and ornaments of pieces of metal to be cast and chased by them, or in which they are to be set. Wax is the substance used for this purpose, and delicacy and minuteness are required. Modelling is also a branch of the potter's trade. F

ed for Wedgwood numerous figures and in wax. For large models, the material is potter's clay, which, when used by s, is mixed with a portion of sandstone, ulverised, to make it work freely.

MODENA (anc. *Mutina*), capital of the former of same name, a fortified city of Northern 4 miles west-north-west of Bologna. Pop.

It stands between the rivers Secchia and in a pleasant plain, noted for its rich soil, fertile air, and from its surrounding ramparts commands fine views of the Apennines. The social life of M. is somewhat stagnant, nevertheless a most agreeable city. It lies on the Via Emilia (see EMILIAN PROVINCES), and it is divided into the old and new city, connected by a navigable canal with the Secchia and Panaro. Amongst the public buildings, may be noted the cathedral of St Geminus, the patron of the city, a structure of the Lombard style. The campanile or belfry is the great tower of Italy; it is a square structure, 315 feet in height, its entire exterior being in white marble. The ducal palace, a fine structure of the 17th c., is adorned with a series of galleries, courts, and marble arches; it contains the splendid Biblioteca Estense, numbering 100,000 volumes, and 3000 rare MSS.; also the Estense archives, a most important collection of legal records, collections of coins and medals of great antiquity, and an observatory. Schools of logic, law, medicine, and mathematics have been at the university, suppressed in 1821; there are also fine museums of natural history, a botanic garden, theatres, and good public baths. The trade is unimportant: the manufactured products are confined to linen and woollen fabrics, leather, glass, and pottery, besides silk manufacture to a much less extent than formerly. M. is the birthplace of the great anatomist Fallopius, and the antiquary Sigonio.

The ancient history of M. affords evidence that it was at an early period a considerable degree of civi-ty; the splendour, wealth, and arts of the M. being mentioned by Cicero, Pliny, and others.

In modern times, M. has shared more or less of the various vicissitudes which befell Italy, and was at one time in the great internecine feuds of the Italian states.

In 960, a member of the great House of Este was proclaimed Marquis of Modena, and the then reigning marquis was created Duke by the Emperor Frederick III. In 1796, Modena was a part of the Cisalpine Republic, but was restored to the House of Este in 1814 by the congress of Vienna to the Este family. The duchy had at that time an area of 2310 square miles, and a population of 150,000.

In 1848, the Duke of Modena was temporarily deprived of his rights; and in 1860, the Duchy of Modena was definitively expelled their unpopular ruler, who carried off all the property and valuables of the state, including the silver handles of the doors. M. has now become a province of the Kingdom of Italy.

MODERATOR, a term used in Scotch ecclesiastical law to describe the chairman or president of a presbyterian church-court.

MODICA, the Mohac of the Saracens, a city of Sicily, in the province of Val di Noto, 12 miles from Syracuse. Pop. 33,169. The city, situated on a rocky hill, contains several fine buildings, and, notwithstanding the humidity of the climate, the sanitary condition of the inhabitants is satisfactory. The soil of the surrounding district is the most productive of Sicily, and yields vast quantities of corn, tobacco, oil, wine,

hemp, which, with cheese, wool, soda, and butter,

form the chief export trade of the place. The valley of Ipsica, or Ispica, in the vicinity of M., contains remarkable rocks, in which numerous dwellings are excavated.

MODILLION, an ornamental bracket (*a* in fig.), much used in classic architecture, especially in the cornices of the Corinthian and Composite styles.

Modillion.

MODULATION, in Music. When in the course of a melody the key-note is changed, and the original scale altered by the introduction of a new sharp or flat, such change is called modulation. Much of the pleasure of music is derived from a judicious use of modulation. The art of good modulation from one key to another consists in the proper choice of intermediate chords. Sudden transitions, without intermediate chords, should be employed but sparingly, and in peculiar circumstances. Every piece of music is composed in a particular key, in which it begins and ends, which generally predominates over any other keys that may be introduced in the course of the composition.

MODULE, in Classic Architecture, an arbitrary measure for determining the proportions of the various members of the orders. The diameter, semi-diameter, or one-third of the diameter are most frequently used; the first being usually divided into 60 parts (or minutes), the second into 30 parts, and the third into 20 parts.

MODULUS, a constant coefficient or multiplier, by means of which one series or system of quantities can be reduced to another similar series or system. Thus we have the modulus of Elasticity (*q. v.*), of Friction (*q. v.*), and of systems of Logarithms (*q. v.*). The system of logarithms which is universally accepted as the primary is Napier's, and from it all other systems are deduced in the following manner: Let *N* be a number of which the Napierian logarithm is *b*, *e* being the Napierian base, it is required to find the logarithm of *N* to some other base *a*. Let *x* be this logarithm, then (see LOGARITHMS)  $N = e^b = a^x$ , and taking the Napierian logarithms of both sides of this equation,  $b \log_e e = x \log_e a$ , or (since  $\log_e e = 1$ )  $b = x \log_e a$ , therefore  $x = \frac{b}{\log_e a}$ ; i.e.,  $\log_a N = \frac{\log_e N}{\log_e a} = \frac{1}{\log_e a} \times \log_e N$ .

This multiplier, or 'modulus,'  $\frac{1}{\log_e a}$ , is independent of *N*, and is therefore constant for the reduction of all Napierian logarithms to the system whose base is *a*. If *a* = 10, the multiplier becomes  $\frac{1}{\log_{10} e}$ , the modulus of Briggs's, or the common system of logarithms, and is equal to  $\frac{1}{2.30258509} = .4342944 \dots$

MODUS, in English Law, means a peculiar custom by which lands become exempted from payment of tithes on paying some composition or equivalent.

MÖEN, a Danish island in the Baltic Sea, separated from Seeland on the north-west by the *Ulfesund*, and from Falster on the south-west by the *Grönsund*.

## MÆRIS—MOHAIR.

It is 19 miles long, by about 5 miles in average breadth. Area, 84 square miles. Pop. about 15,000, who are supported by agriculture, fisheries, and commerce. It has been called the Switzerland of Denmark, and is remarkable for the irregularity of its surface. The soil is fruitful. Its chief town and seaport, Stege, has a population of 1934.

**MÆRIS, LAKE**, the ancient name of a sheet of water in Egypt, now known as *Birket-el-Kerûn*, or *El-Korn* ('The Lake of the Promontory'), is situated in the province of Fayûm, about 50 miles south-west of Cairo; extreme length from north-east to south-west, 30 miles; breadth, 6 miles: it was formerly much larger. Its average depth is 12, and its greatest ascertained depth 28 feet. On the north and west, its shores are rocky, but on the south, flat and sandy. It is connected with the Nile by a canal called *Bahr-Jusuf* ('The River of Joseph'). The waters are brackish, on account of their being impregnated with the alkaline salts of the desert, and with the muriate-of-lime depositions of the surrounding hills. In the time of the Pharaohs, the revenue derived from the fisheries was applied to the maintenance of the queen's wardrobe and perfumes. Under the Persians, they were let (during the season of the inundations, when the canal fed the lake) at £150 a day. At present, however, they only yield about £84 a year.

**MÆSIA**, an ancient Roman province, bounded by the Danube on the N., the Black Sea on the E., the mountain-chains of *Hæmus* (Balkan) and *Orbelus* on the S., that of *Scardus* and the rivers *Drinus* (Drina) and *Savus* (Save) on the W. The river *Giabrus* (Cibriz) divided it into two parts, of which the Eastern (*Mæsia Inferior*) is the present Bulgaria, and the Western (*Mæsia Superior*) is Servia. Its original inhabitants were mostly of Thracian race. Gaulish or Celtic invaders settled in Western Mæsia about 277 B.C., under the name of *Scordisci*. The Romans first came in contact with the tribes of M. after the conquest of Macedonia, when C. Scribonius Curio forced his way as far north as the Danube, and gained a victory over the Mæsians (75 B.C.), but the country was not completely subjugated till 29 B.C. It was made a Roman province in the reign of Augustus, and flourished for more than two centuries, but as a frontier province it was much exposed to hostile invasions, and required a line of fortresses and stations all along the south bank of the Danube. In 250 A.D., the Goths made an irruption into the country, and defeated and slew the Roman emperor, Decius. In the following year, and about the end of the 4th c., it was given up to them by the Emperor Theodosius I. Slavonian tribes settled in M. in the 6th and 7th centuries.

**MÆSO-GOTHS**, the name given to the Goths who in the 3d c. settled in Lower Mæsia at the mouth of the Danube. Ulfilas (q.v.) was a Mæso-Goth. The name, however, became of more general use to designate those who remained in Mæsia after the great migration in the beginning of the 5th century.

**MO'FFAT**, a market-town and favourite watering-place of Scotland, in the county of Dumfries, stands in the upper part of the broad and beautiful valley of the Annan, and is surrounded by hills of moderate elevation. It is two miles from the Beattock station, on the Caledonian Railway, and 19 miles north-north-east of Dumfries. Among other public edifices are the baths and the reading and assembly rooms. The mineral springs, the principal of which, like that of Harrogate, is saline and sulphurous, are highly celebrated; but perhaps the greatest attrac-

tions of the place are its salubrious air and exquisite environs. During the season, the town is increased in population by from 800 to 1000 visitors, to suit whose convenience great numbers of elegant villas, commanding fine views of the neighbouring country, have been erected. Pop. (1871) 1730.

—The Moffat Hills extend between the counties of Lanark and Peebles in the north, and Dumfries in the south; highest summit Hartfell, 2650 feet. See *Black's Guide to Moffat*.

**MOGADO'RE, or SUERRA**, a fortified town, and the principal seaport of Morocco, 130 miles west-south-west of the city of that name, on the Atlantic Ocean. Pop. about 20,000. It is the port of the capital, and was founded in 1760, on the site of an old Portuguese fort. It stands on a rocky promontory, opposite an island of the same name, long a haunt of pirates, which forms the harbour, and is said to be the best built town of the kingdom. Its streets are regular, though narrow, and it consists of two parts, each surrounded by water. The quarter called the Fortress contains the custom-house, and the treasury, and is the residence of the pasha, the vice-consul, and the Christian merchants. The town is defended by four batteries on the island, and by a fort on the land-side; the walls are also defensible. M. is the seat of considerable trade; it exports wool, gun, hides, feathers, gold-dust, and almonds. In 1864, 75 vessels, of 19,673 tons, entered, and 72, of 18,801 tons, cleared the port. In 1866, 94,854 cwts. and in 1867, 12,689 cwts. of olive-oil were exported. More than half the above vessels were British. The imports are woollens, cottons, hardware, &c.

**MOGU'L, GREAT**, the popular designation of the emperor of Delhi, as the impersonation of the powerful empire established in Hindustan by the Mongols (q.v.), who were called *Moguls* by the Persians. The first Great Mogul was Baber, the great-grandson of Timûr, who founded the Mongul empire in Hindustan in 1526. In 1803, the Great Mogul was deprived of his throne; in 1827, of even the appearance of authority, becoming a mere pensioner of the British; and in 1858, Mohammed Bahadûr, the last of the dynasty, was condemned, and transported for complicity in the Indian mutiny.

**MOHA'CS**, a market-town of Hungary, 110 miles south-south-west of Pesth, on the western arm of the Danube. It contains a gymnasium, has an important cattle-market, is a station for steamboats on the Danube, and the seat of considerable trade in wine, coal, timber, and agricultural produce. Pop. 12,140. It owes its historical importance to the great battle fought here, 29th August 1526, between Lewis II. of Hungary, with 25,000 Hungarians, and the Sultan Soliman, at the head of about 200,000 Turks. The battle resulted in the disastrous defeat of the Hungarians, who lost their king, 7 bishops, many nobles and dignitaries, and upwards of 22,000 men. A second battle was fought here on the 12th August 1687, when the Turks in their turn were defeated, by an Austro-Hungarian army under Charles of Lorraine.

**MO'HAIR**, the wool of the Angora goat (see GOAT and ANGORA), a native of Asia Minor. Few animals have so beautiful a covering as the fine, soft, silky, long, and always pure white wool of this goat. Each animal, at the annual clip in April or May, yields from 2 lbs. to 4 lbs. of wool. It is only within the last twelve or fourteen years that the wool has been in great request in Britain, but its development as an article of trade has been simultaneous with that of Alpaca. See WOOLLEN MANUFACTURES.

## MOHAMMED.

MOHAMMED (Arab. *the Praised*), the name, at a later period, by the founder of Islam. He was originally called *Halabi*. He was born about the year 570 A. D., at Mecca, and was the son of Abdallâh, of the family of the Hâshim; and Aminah, of the family of Zuhra, both of the powerful tribe of the Koreish, but of a side-branch only, and therefore of little or no influence. His father, a poor merchant, died either before or shortly after his birth, whom his mother then (according to a doubtful tradition) is supposed to have handed over, in the fashion of her tribe, to a Beduin woman, at she might nurse him in the salubrious air of the desert. In consequence of the repeated deaths of the child, however, which were ascribed to evil spirits, the nurse sent him back in his third year. When six years old, he also lost his mother. His grandfather, Abd-Al-Mutallib, adopted the boy; and when, two years later, he too died, M.'s uncle, Abu Talib, though poor himself, took him into his house, and remained his best friend and protector throughout his whole life. The accounts which have survived of the time of his youth are of too legendary nature to deserve credit; certain, however, it seems to be that he at first gained a scanty livelihood tending the flocks of the Meccans, and that he was twice accompanied by his uncle on his journeys into Southern Arabia and Syria. In his 25th year, he entered the service of a rich widow, named Chadidja, who descended from the Koreish, and accompanied her caravans—in an inferior capacity, perhaps as a camel-driver—to the fairs. Up to that time, his circumstances were very poor. Suddenly his fortune changed. The wealthy, but much older, and twice his age, Chadidja offered him her hand, which he accepted. She bore him a son, Al-Kâsim—whence he adopted the name Abu Al-Kâsim—and four daughters: Zainab, Rukaija, Umm Kulthûm, and Fatima; and afterwards a second son, whom he called Al-Manâf, after an idol worshipped among his people. Both his sons, however, died early. M. continued his merchant's trade at Mecca, but without much energy, spending most of his time in solitary meditations. In his 35th year, he is said to have, by chance only, been chosen arbiter in a quarrel about the replacing of the sacred black stone in the Kaaba (q. v.); but not before his 40th year is there anything really important to be told of his life. Before, however, entering on the weighty events of the subsequent period, it is by no means unimportant to advert to such traits of M.'s outward appearance as are yet recoverable. He was of middle height, rather lean, but broad shouldered, altogether of strong build; slightly curled black hair flowed round his strongly developed head; eyes, overhung with thick eyelashes, were large and coal-black; his nose, large and slightly bent, was well formed. A long beard added to the dignity of his appearance. A black mole between his shoulders became afterwards among the faithful a seal of prophecy. In his walk, he moved his whole body violently, 'as if descending a mountain.' His gait and presence were altogether of an extremely imposing nature. In his 40th year M. received his first 'revelation,' or, in other words, became first aware that he had a 'mission.' About the year 600 A. D., Christianity had penetrated the heart of Arabia, through Syria on the one, and Abyssinia on the other hand. Judaism no less held a prominent part in the peninsula, chiefly in the northern parts, which were dotted over with Jewish colonies, founded by emigrants after the

Or, according to Deutsch, whose view is fully corroborated and adopted by Sprenger in his *Leben und Lehre Mohammeds*, in allusion to Hag. ii. 7, the expected Messiah.

destruction of Jerusalem; and round about Yathrib (Medina). Besides these two all-important religious elements, several sects, remnants of the numerous ancient sects which had sprung up everywhere during the first Christian centuries: Sabians, Mandæans, &c., on the frontiers of Syria and Babylonia, heightened the religious ferment which, shortly before the time of M., had begun to move the minds of the thoughtful. At that time there arose, according to undoubted historical accounts, several men in the Hedjaz (Waraka, Obeid Allah, Othman, Zayd, &c.), who preached the futility of the ancient pagan creed, with its star-worship, its pilgrimages, and festive ceremonies, its temples and fetiches. It had in reality long ceased to be a living faith, and only the great mass of the people clung to it as to a sacred inheritance from times immemorial. The unity of God, the 'ancient religion of Abraham,' was the doctrine promulgated by these forerunners of M., and many of those who, roused by their words, began to search for a form of religion which should embody both the traditions of their forefathers and a purer doctrine of the Divinity, turned either to Judaism or to Christianity. The principal scene of these missionary labours was Mecca, then the centre of the pilgrimages of most of the Arabian tribes, and where, from times immemorial, long anterior to the city itself, the Kaaba (q. v.), Mount Arafat, the Valley of Mina, &c., were held sacred—the Koreish, M.'s tribe, having the supreme care over these sanctuaries, ever since the 5th century. It was under these circumstances that M. felt 'moved' to teach a new faith, which should dispense with idolatry on the one, as with Judaism and Christianity on the other hand. He was 40 years of age, as we said, when he received the first 'divine' communication in the solitude of the mountain Hirâ, near Mecca. Gabriel appeared to him, and in the name of God commanded him to 'read'—that is, to preach the true religion, and to spread it abroad by committing it to writing (Sur. xvi.). How far M. was a 'prophet,' in the common sense of the word, has been the subject of endless and utterly futile discussions in the Christian world. That he was no vulgar impostor, is now as generally recognised as that other once popular doctrine, that he was in league with the devil, is rejected by thinking men. What part his epilepsy had in his 'visions,' we are not able to determine. Certain it is that, after long and painful solitary broodings, a something—not clearly known to himself—at times moved him with such fearfully rapturous vehemence, that, during his revelations, he is said to have roared like a camel, and to have streamed with perspiration; his eyes turned red, and the foam stood before his mouth. The voices he heard were sometimes those of a bell, sometimes of a man, sometimes they came in his dreams, or they were laid in his heart. Waraka, one of his wife's relatives, who had embraced Judaism, spoke to him of the Jewish doctrine, and told him the story of the patriarchs and Israel; not so much as it is told in the Bible, but in the Midrash; and the gorgeous hues of the legendary poetry of the latter seem to have made as deep an impression on M.'s poetical mind as the doctrine of the unity of God and the *morale*—in its broad outlines—of the Old Testament, together with those civil and religious laws, scriptural and oral, which are either contained as germs or fully developed in this record. Christianity exercised a minor influence upon him and his spiritual offspring. All his knowledge of the New Testament was confined to a few apocryphal books, and with all the deep reverence before Jesus, whom, together with Moses, he calls the greatest prophet, next to himself, his notions of the Christian religion and its founder were excessively

## MOHAMMED.

vague. For some details on these points, however, we must refer to KORAN and MOHAMMEDANISM.

His first revelation he communicated to no one, it would appear, except to Chadidja, to his daughters, his stepson Ali, his favourite slave Zaid—whom he had probably freed and adopted by this time—and to his friend the prudent and honest Abu Bekr. His other relatives rejected his teachings with scorn. Abu Lahab, his uncle, called him a fool; and Abu Talib, his adoptive father, although he never ceased, for the honour of his family, to protect him, yet never professed any belief in M.'s words. In the fourth year of his mission, however, he had made forty proselytes, chiefly slaves and people from the lower ranks; and now first some verses were revealed to him, commanding him to come forward publicly as a preacher, and to defy the scorn of the unbelievers. With all his power, he now inveighed against the primeval superstition of the Meccans, and exhorted them to a pious and moral life, and to the belief in an all-mighty, all-wise, everlasting, indivisible, all-just, but merciful God, who had chosen him as he had chosen the prophets of the Bible before him, so to teach mankind that they should escape the punishments of hell, and inherit everlasting life. God's mercy—this was a primitive doctrine, common to the whole East—was principally to be obtained by prayer, fasting, and almsgiving. The belief in the sacredness of the Kaaba and the ceremonies of the pilgrimage was too firmly rooted in his and the people's minds not to be received into the new creed; but certain barbarous habits of the Beduins, such as the killing of their new-born daughters, were ruthlessly condemned by Mohammed. The prohibition of certain kinds of food also belongs to this first period, when he as yet entirely stood under the influence of Judaism; the prohibition of gambling, usury, &c., probably being of a somewhat later date. Whether he did or did not understand the art of writing and reading at the commencement of his career, is not quite clear; certain it is that he pretended not to know it, and employed the services of amanuenses for his Koranic dicta, which at first consisted merely of brief, rhymed sentences in the manner of the ancient Arabic soothsayers. [KORAN.] The Meccans did not object to his doings; they considered him a common 'poet' or 'sooth-sayer,' who, moreover, was not in his right senses, or simply a liar. Gradually, however, as the number of his converts increased, they began to pay more and more attention to his proceedings; and finally, fearing mostly for the sacredness of Mecca, which the new doctrine might abolish, thus depriving them of their chief glory and the ample revenues of the pilgrimages, they rose in fierce opposition against the new prophet and his adherents, who dared 'to call their ancient gods idols, and their ancestors fools.' Many of the converted slaves and freedmen had to undergo terrible punishments; and others suffered so much at the hands of their own relatives, that they were fain to revoke their creed; so that the prophet himself advised his followers to emigrate to Abyssinia. M. himself, although protected by the strong arm of Abu Talib, was yet at that time so low-spirited and fearful, that he even raised the idols, which hitherto he had represented as nought, to intermediate beings between God and man—a dictum, however, which he soon revoked, as an inspiration of Satan, thereby increasing the hatred of his adversaries, at whose head stood two members of the family of Machzum, Al-Walid and Abulhakam Amr (called by Mohammed 'Father of Foolishness'), and who in every way tried to throw ridicule on him. At last it became necessary that he should be put beyond the reach of his persecutors, and Abu Talib hid him in

a fortified castle of his own in the country. Here his uncle, and Omar, formerly a bitter enemy of M. and who afterwards, with M. and Abu Bekr, became the third head of Islam, continued in the mean time to spread the new doctrine. The Koran demanded that M. should be delivered into their hands; but Abu Talib steadfastly refused to comply with their wishes; a feud thereupon broke out between their family and that of the Hashemites, and M. and all the members of his family, except perhaps, Abu Lahab, were excommunicated. In the space of three years, however, the 'peace party' in Mecca brought about a reconciliation, and M. was allowed to return. A great grief befell him at this time—his faithful wife Chadidja died, and shortly afterwards, his uncle Abu Talib, and to add to his misery, the vicissitudes of his career had reduced him by this time to poverty. An emigration to Taif, where he sought to improve his position, proved a failure; it was with great difficulty that he escaped with his bare life. During this epoch, he had the well-known dream of his journey to Jerusalem and in the heaven on the back of the Borak (Miraj), the relation of which caused even his staunchest adherents to smile at his hallucination. Shortly after his return from Taif, he married Sauda, and afterwards increased the number of his wives, that at his death he still left nine, of whom Ayidsh, the daughter of Abu Bekr, and Hafsa, the daughter of Omar, are best known. In the midst of his endeavours to find a hearing in his own city, and those near it, he succeeded, during a pilgrimage, in converting several men from Medina, whose inhabitants had long been accustomed to hear from the mouths of the numerous Jews living in the city and its neighbourhood the words Revelation, Prophecy, God's Word, Messiah: to the Meccans mere words without any meaning. The seed sown into the minds of these men bore a fruitful harvest. The next pilgrimage brought twelve, and the third more than seventy adherents to the new faith from Medina, and with these he entered into a close alliance. M. now conceived the plan to seek refuge in the friendly city of Medina, and about 622 (ten, thirteen, or fifteen years—according to the different traditions—after his first assuming the sacred office) he fled thither, about one hundred families of his faithful flock having preceded him some time before, accompanied by Abu Bekr, and reached, not without danger, the town, called then Medinat Annabi (City of the Prophet), or Medina 'City,' by way of eminence; and from this flight, or rather from the first month of the next Arabic year, dates the Mohammedan Era (Hedjrah). Now everything was changed to the advantage of the prophet and his religion; and if formerly the incidents of his life are shrouded in comparative obscurity, they are, from this date, known often to their most insignificant details. Formerly a despised 'madman or impostor,' he now assumed at once the position of highest judge, lawgiver, and ruler of the city and two most powerful Arabic tribes. His first care was directed towards the consolidation of the new worship, and the inner arrangements in the congregation of his flock; his next chief endeavour was to proselytise the numerous Jews who inhabited the city, to whom, besides having received their principal dogmas into his religion, he made many important concessions also in the outer observance of Islam, and concluded alliances with many of their tribes; but he was sorely disappointed in his hopes to convert them. They ridiculed his pretensions to be the Messiah, and so enraged him by their constant taunts, that he soon abrogated his concessions, and became their bitterest adversary up to the hour of

## MOHAMMED.

his death. The most important act in the first year of the Hedjrah was his permission to go to war with the enemies of Islam in the name of God—a kind of manifesto chiefly directed against the Meccans. Not being able at first to fight his enemies in open field, he endeavoured to weaken their power by attacking the caravans of the Koreish on their way to Syria. Being successful enough to disturb their trade, and, at the same time, to conclude alliances with the adjoining Beduin tribes, he at last dared to break even the peace of the sacred month of Radjab, and with this the signal to open warfare was given. A battle, the first, between 314 Moslems and about 600 Meccans was fought at Badr, in the second year of the Hedjrah; the former gained the victory, and made many prisoners. A great number of adventurers now flocked to M.'s colours, and he successfully continued his expeditions against the Koreish and the Jewish tribes, chiefly the Beni Keinukâ, whose fortified castles he took after a long siege. Notwithstanding a severe loss which he suffered in the battle near Ohod, in which he himself was dangerously wounded, his power increased so rapidly that in the sixth year of the Hedjrah already he was able to proclaim a public pilgrimage to Mecca. Although the Meccans did not allow this to be carried out, he gained the still greater advantage that they concluded a formal peace with him, and thus recognised him as an equal power and belligerent. He was now allowed to send his missionaries all over Arabia, and even beyond the frontiers, without any hindrance; and in the following year he had the satisfaction of celebrating the pilgrimage for three days undisturbed at Mecca. Shortly afterwards, during his expeditions against the Jews of Chaibar and Fadak, M. very nearly lost his life: a Jewess, Zainab by name, a relative of Abim had fallen in the fight against him, placed a poisoned piece of roast meat before him, and although he merely tasted it, he yet, up to his death, suffered from the effects of the poison. His missionaries at this time began to carry his doctrines abroad, to Chosroes II., to Heraclius, to the king of Abyssinia, the Viceroy of Egypt, and the chiefs of several Arabic provinces. Some received the new Gospel; but Chosrû Parvis, the king of Persia, and Amru the Ghassanide, rejected his proposals with scorn, and the latter had the messenger executed. This was the cause of the first war between the Christians and the Muslims, in which the latter were beaten with great loss by Amru. The Meccans now thought the long-desired moment of revenge at hand, and broke the peace by committing several acts of violence against the Chuzaites, the allies of Mohammed. The latter, however, marched at the head of 10,000 men against Mecca, before its inhabitants had had time to prepare for the siege, took it, and was publicly recognised by them as chief and prophet. With this the victory of the new religion was secured in Arabia. While, however, employed in destroying all traces of idolatry in the besieged city, and fixing the minor laws and ceremonies of the true faith, M. heard of new armies which several warlike Arabic tribes marched against him, and which were concentrated near Taif (630). Again he was victorious, and his dominion and creed extended further and further every day. From all parts flocked the deputations to do homage to him in the name of the various tribes, either as the messenger of God, or at least as the Prince of Arabia, and the year 8 of the Hedjrah was therefore called the year of the Deputations. Once more he made most extensive preparations for a war against the Byzantines; but not being able to bring together a sufficient army; he had to be satisfied with the

homage of a few minor princes on his way to the frontiers, and to return without having carried out his intention. Towards the end of the 10th year of the Hedjrah he undertook, at the head of at least 40,000 Muslims, his last solemn pilgrimage to Mecca, and there (on the Mount Arafat) instructed them in all the important laws and ordinances, chiefly of the pilgrimage; and the ceremonies observed by him on that occasion were fixed for all times. [HAJJ.] He again solemnly exhorted his believers to righteousness and piety, and chiefly recommended them to protect the weak, the poor, and the women, and to abstain from usury.

Returned from Mecca, he occupied himself again with the carrying out of his expedition against Syria, but fell dangerously ill very soon after his return. One night, while suffering from an attack of fever, he went to the cemetery of Medina, and prayed and wept upon the tombs, praising the dead, and wishing that he himself might soon be delivered from the storms of this world. For a few more days he went about; at last, too weak further to visit his wives, he chose the house of Ayesshah, situated near a mosque, as his abode during his sickness. He continued to take part in the public prayers as long as he could; until at last, feeling that his hour had come, he once more preached to the people, recommending Abu Bekr and Usma, the son of Zaid, as the generals whom he had chosen for the army. He then asked, like Moses, whether he had wronged any one, and read to them passages from the Koran, preparing the minds of his hearers for his death, and exhorting them to peace among themselves, and to strict obedience to the tenets of the faith. A few days afterwards, he asked for writing materials, probably in order to fix a successor to his office as chief of the faithful; but Omar, fearing he might choose Ali, while he himself inclined to Abu Bekr, would not allow him to be furnished with them. In his last wanderings he only spoke of angels and heaven. He died in the lap of Ayesshah, about noon of Monday the 12th (11th) of the third month, in the year 11 of the Hedjrah (8th of June 632). His death caused an immense excitement and distress among the faithful, and Omar, who himself would not believe in it, tried to persuade the people of his still being alive. But Abu Bekr said to the assembled multitude: 'Whoever among you has served Mohammed, let him know that Mohammed is dead; but he who has served the God of Mohammed, let him continue in his service, for he is still alive, and never dies.' While his corpse was yet unburied, the quarrels about his successor, whom he had not definitively been able to appoint, commenced; and finally, Abu Bekr received the homage of the principal Muslims at Medina. M. was then buried in the night from the 9th to the 10th of June, after long discussions, in the house of Ayesshah, where he had died, and which afterwards became part of the adjoining mosque.

This, in briefest outline, is M.'s career. We have not been able to dwell, as we could have wished to do, with any length, either on the peculiar circumstances of his inner life, which preceded and accompanied his 'prophetic' course, nor on the part which Idolatry, Judaism, Christianity, and his own reflection respectively, bore in the formation of his religion; nor have we been able to trace the process by which his 'mission' grew upon him, as it were, and he, from a simple admonisher of his family, became the founder of a faith to which now above 130 millions are said to adhere. The articles KORAN and MOHAMMEDANISM contain some further details on his doctrine and its history. We have, in addition to the few observations on the points indicated at the beginning,

only to reiterate, that a man of Mohammed's extraordinary powers and gifts is not to be judged by a modern common-place standard; and that the manners and morals of his own time and country must also be taken into consideration. We are far from overrating his character. He was at times deceitful, cunning, even revengeful and cowardly; and generally addicted beyond limit to sensuality. But all this does not justify the savage and silly abuse which has been heaped upon his name for centuries by ignorance and fanaticism. Not only his public station as prophet, preacher, and prince, but also his private character, his amiability, his faithfulness towards friends, his tenderness towards his family, and the frequent readiness to forgive an enemy; besides the extreme simplicity of his domestic life (he lived, when already in full power, in a miserable hut, mended his own clothes, and freed all his slaves), must be taken into consideration; and, to do him full justice, his melancholic temperament, his nervousness, often bordering on frenzy, and which brought him to the brink of suicide, and his being a poet of the highest order, with all the weaknesses of a poet developed to excess, must not be forgotten. Altogether, his mind contained the strangest mixture of right and wrong, of truth and error. Although his self-chosen mission was the abolition of superstition, he yet believed in Jins, omens, charms, and dreams, and this is an additional reason against the, as we said, now generally abandoned notion, that he was a vulgar designer, who by no means deceived himself about those revelations which he pretended to have received. And however much the religion of Islam may, rightly or wrongly, be considered the bane and prime cause of the rottenness of eastern states and nations in our day, it must, in the first place, not be forgotten that it is not necessarily Islam which has caused the corruption, as indeed its ethics are for the most part of the highest order; and in the second place, that Mohammed is not to be made responsible for all the errors of his successors. Take him all in all, the history of humanity has seen few more earnest, noble, and sincere 'prophets'—using the word prophet in the broad human sense of one irresistibly impelled by an inner power to admonish, and to teach, and to utter austere and sublime truths, the full purport of which is often unknown to himself.

The most important European biographies of M. are those of Sprenger, Weil, Muir, Nöldeke, Reinaud. See also KORAN, MOHAMMEDANISM, SUNNA.

**MOHAMMED**, the name of four sultans of Turkey, of whom the most noted is **MOHAMMED II.**, surnamed *Bujuk* or **THE GREAT**, the conqueror of Constantinople. He was born at Adrianople in 1430, and succeeded his father, Amurath II., in 1450. His first acts were the murder of his two brothers, and the suppression of a rebellion in Karaman. Having thus secured himself on the throne, he bent all his energies to the accomplishment of the great project which had always been kept prominently in view by his predecessors—the capture of Constantinople. This city was now the sole remnant of the once mighty empire of the Cæsars; and after more than a year spent in preparations, M. commenced the siege, 6th April 1453, with an army of 258,000 men, and a fleet of 320 vessels. The Greeks, aided by a gallant band of 2000 strangers, under Gian Justiniani, a noble Genoese, long maintained an obstinate resistance. On the morning of the 29th May, a combined attack was made by land and sea without success; but the retirement from the ramparts of Justiniani, who had been severely wounded, and despaired of a successful defence, caused a panic among his followers, and the simultaneous charge of

a chosen body of janizaries, with M. himself at their head, was irresistible. Constantine XIII. died in the breach, and the Turks poured in over the corpse to plunder and devastate his capital. M. now transferred the seat of his government to Constantinople, and sought to win back the infidels by promising them the free exercise of the religion. He next reduced the kingdoms of Man and Trebizond, offshoots of the Greek empire, obtained possession of Servia on the death of its last prince, and made formidable preparations for the invasion of Hungary. Belgrade was the first point of attack; and with 100,000 men, supported by a fleet of 200 ships on the Danube, M. set down before its walls. The enormous ordinance which had done such good service at Constantinople, was employed to batter the ramparts; but the valor, skill, and activity of the defenders foiled his stout efforts. John Hunyady (q. v.), who, with 300 chosen troops, had reinforced the garrison, destroyed or captured all his vessels, and soon after, by a sudden sally, defeated his army, and carried off the battering-train, compelling him to raise the siege, 6th August 1456. His next enterprise was the invasion of Epirus, where Scanderbeg had hitherto successfully defied the sultan's power. Three Turkish armies were destroyed in rapid succession, and a fourth and fifth under M. himself met with no greater success; but the death of the gallant Epirote, in 1467, removed the only obstacle to the success of the sultan's plans, and Epirus was forthwith annexed to Turkey. The latter half of M.'s reign was also fruitful in important achievements, but our space will permit only a cursory notice of them. He reduced the Khan of the Crimea to the condition of a vassal, deprived the Genoese of Caffa, and the Venetians of Friuli, Istria, Negropont, and Lemnos; but the Knights of St. John repelled him from Rhodes, and the Venetians from Scodra. He carried his arms into Italy, and took Otranto, but died in 1481 at Nicomedia, while on the way to join his son Bajazet, who was warring with the Persians and Egyptians. His frequent contests with the former of these nations had always interfered very much with the successful prosecution of his designs of conquest in Europe. M. was possessed of great abilities; he was brave, enterprising, and sagacious; nor was he deficient in learning, for he spoke four languages fluently, was well versed in geography, ancient history, and the natural sciences, and was practically acquainted with the fine arts. But the brilliancy of his career, and the occasional generosity and even magnanimity which he shewed, cannot obliterate the recollection of those acts of cruelty and treachery which have justly branded him as the most ruthless tyrant of the House of Osman. As the founder of the Turkish power in Europe, his memory has always been revered by the Turks.

**MOHAMMEDANISM**, the religion founded by Mohammed, or, according to him, the only orthodox creed existing from the beginning of the world, and preached by all the prophets ever since Adam. It is also called *Islām*, Resignation, entire Submission to the will and precepts of God. In its exclusively dogmatical or theoretical part, it is *Imān*, Faith; in its practical, *Dīn*, Religion (by way of eminence). The fundamental principles of the former are contained in the two articles of belief: 'There is no God but God; and Mohammed is God's Apostle.' The Mohammedan doctrine of God's nature and attributes coincides with the Christian, in so far as he is by both taught to be the Creator of all things in heaven and earth, who rules and preserves all things, without beginning, omnipotent, omniscient, omnipresent, and full of mercy. Yet, according to

## MOHAMMEDANISM.

the Mohammedan belief, he has no offspring: 'Hegetteth not, nor is he begotten.' Nor is Jesus called anything but a prophet and apostle, although a birth is said to have been due to a miraculous virgine operation; and as the Koran superseded the Gospel, so Mohammed, Christ. The crucifixion is said to have been executed upon another person, Christ having been taken up unto God before the decree was carried out. He will come again upon the earth, to establish everywhere the Moslem religion, and to be a sign of the coming of the day of judgment. Next to the belief in God, that in angels forms a prominent dogma. Created of fire, and endowed with a kind of incorporeal body, they stand between God and man, adoring or waiting upon the former, or interceding for and guarding the latter. The four chief angels are 'The Holy Spirit,' or 'Angel of Revelations'—Gabriel; the special protector and guardian of the Jews—Michael; the Angel of Death—Azraël (Raphael, in the apocryphal gospel of Barnabas), and Israfil—Uriel, whose office it will be to sound the trumpet at the Resurrection. It will hardly be necessary, after what is said under MOHAMMED, to point out, in every individual instance, how most of his 'religious' notions were taken almost bodily from the Jewish legends; his angelology, however, the Jews had borrowed themselves from the Persians, only altering the names, and, in a few cases, the offices of the chief angelic dignitaries. Besides angels, there are good and evil genii, the chief of the latter being Iblis (Despair), once called Azazel, who, refusing to pay homage to Adam, was rejected by God. These are of a grosser fabric than angels, and subject to death. They, too, have different names and offices (Genii, Fairies; Divs, Giants; Takvins, Fates, &c.), and are, in almost every respect, like the Shédim in the Talmud and Midrash. A further point of belief is set in certain God-given Scriptures, revealed successively to the different prophets. Four only of the original one hundred and four sacred books: *the Pentateuch, the Psalms, the Gospel, and the Koran*, are said to have survived; the three former, however, in a mutilated and falsified condition. Besides these, a certain apocryphal gospel, attributed to St Barnabas, and the writings of Daniel, together with those of a few other prophets, are taken notice of by the Moslems, but not as canonical books. The number of prophets, sent at various times, is stated variously at between two and three hundred thousand, among whom 313 were apostles, and six were specially commissioned to proclaim new laws and dispensations, which abrogated the preceding ones. These were Adam, Noah, Abraham, Moses, Jesus, and Mohammed—the last the greatest of them all, and the propagator of the final dispensation. The belief in the resurrection and the final judgment is the next article of faith. The dead are received in their graves by an angel announcing the coming of the two examiners, Monker and Nakir, who put questions to the corpse respecting his belief in God and Mohammed, and who, in accordance with the answers, either torture or comfort him. This, again, is the Jewish 'Chibbut hakkeber,' the Beating of the grave, a hyperbolical description of the sufferings during the intermediate state after death (purgatory). The soul, awaiting the general resurrection, enters according to its rank, either immediately into paradise (prophets), or partakes, in the shape of a green bird, of the delights of the abode of bliss (martyrs), or—in the case of common believers—is supposed rather to stay near the grave, or to be with Adam in the lowest heaven, or to remain either in the well of Zem-Zem, or in the trumpet of the resurrection. According to others, it rests in the shape of a white

bird under the throne of God. The souls of the infidels dwell in a certain well in the province of Hadramaut (Heb. Chambers of Death), or, being first offered to heaven, then offered to earth, and rejected by either, subject to unspeakable tortures until the day of resurrection. Concerning the latter, great discrepancy reigns among the Mohammedan theologians. Mohammed himself seems to have held that both soul and body will be raised, and the 'Bone Luz' of the Jewish Haggadah was by him transformed into the bone Al Ajb, the rump-bone, which will remain uncorrupted till the last day, and from which the whole body will spring anew, after a forty days' rain. Among the signs by which the approach of the last day may be known—nearly all taken from the legendary part of the Talmud and Midrash, where the signs of the coming of the Messiah are enumerated—are the decay of faith among men, the advancing of the meanest persons to highest dignities, wars, seditions, and tumults, and consequent dire distress, so that a man passing another's grave shall say: 'Would to God I were in his place!' Certain provinces shall revolt, and the buildings of Medina shall reach to Yahab. Again: the sun will rise in the west, the Beast will appear, Constantinople will be taken by the descendants of Isaac, the Anti-Christ will come, and be killed by Jesus at Lud. There will further take place a war with the Jews, Gog and Magog's (Jajug and Majug's) eruption, a great smoke, an eclipse, the Mohammedans will return to idolatry, a great treasure will be found in the Euphrates, the Kaaba will be destroyed by the Ethiopians, beasts and inanimate things will speak, and finally, a wind will sweep away the souls of those who have faith, even if equal only to a grain of mustard seed, so that the world shall be left in ignorance. The time of the resurrection, even Mohammed could not learn from Gabriel: it is a mystery. Three blasts will announce it: that of consternation, of such terrible powers, that mothers shall neglect the babes on their breasts, and that heaven and earth will melt; that of examination, which will annihilate all things and beings, even the angel of death, save paradise and hell, and their inhabitants; and forty years later, that of resurrection, when all men, Mohammed first, shall have their souls breathed into their restored bodies, and will sleep in their sepulchres until the final doom has been passed upon them. The day of judgment, lasting from one to fifty thousand years, will call up angels, genii, men, and animals. The trial over, the righteous will enter paradise, to the right hand, and the wicked will pass to the left, into hell; both, however, have first to go over the bridge Al Sirât, laid over the midst of hell, and finer than a hair, and sharper than the edge of a sword, and beset with thorns on either side. The righteous will proceed on their path with ease and swiftness, but the wicked will fall down headlong to hell below—a place divided into seven stories or apartments, respectively assigned to Mohammedans, Jews, Christians, Sabians, Magians, idolaters, and—the lowest of all—to the hypocrites, who, outwardly professing a religion, in reality had none. The degrees of pain—chiefly consisting in intense heat and cold—vary; but the Mohammedans, and all those who professed the unity of God, will finally be released, while unbelievers and idolaters will be condemned to eternal punishment. Paradise is divided from hell by a partition (Orf), in which a certain number of half-saints will find place. The blessed, destined for the abodes of eternal delight (Jannat Aden, Heb. Gan Eden)—of which it is, however, not quite certain whether it is created already—will first drink of the Pond of

degrees), they are a wild conglomeration of Jewish, Christian, Magian, and other fancies on the subject, to which the Prophet's own exceedingly sensual imagination has added very considerably. Feasting in the most gorgeous and delicious variety, the most costly and brilliant garments, odours and music of the most ravishing nature, and above all, the enjoyment of the Hûr Âl Oyûn, the black-eyed daughters of paradise, created of pure musk, and free from all the bodily weaknesses of the female sex, are held out as a reward to the commonest inhabitants of paradise, who will always remain in the full vigour of their youth and manhood.\* For those deserving a higher degree of recompense, rewards will be prepared of a purely spiritual kind—i. e., the 'beholding of God's face' (Shechinah) by night and by day. A separate abode of happiness will also be reserved for women, but there is considerable doubt as to the manner of their enjoyment. That they are not of a prominently spiritual nature, is clear from the story of the Prophet and the old woman. The latter solicited Mohammed to intercede with God that she might be admitted into paradise, whereupon he replied that old women were not allowed in paradise, which dictum—causing her to weep—he further explained by saying that they would first be made young again. The last of the precepts of pure faith taught by Mohammedanism is the full and unconditional submission to God's decree [ISLAM], and the predestination of good and evil, which is found from the beginning inscribed on a 'preserved table.' Not only a man's fortunes, but his deeds, and consequently his future reward or punishment, are irrevocably, and thus unavoidably, pre-ordained (Fate): a doctrine which is not, however, taken literally by *all* Moslems, but which has no doubt contributed largely to the success of Islam, by inspiring its champions with the greatest indifference and contempt for the dangers of warfare; their destiny being immutably fixed under any circumstances.

Thus far, briefly, the Iman, dogmatical or theoretical part of Islam. The Din, or practical part,

\* 'The whole earth will be as one loaf of bread, which God will reach to them like a cake; for meat they will have the ox Balâm and the fish Nûn, the lobes of whose livers will suffice seventy thousand men. Every believer will have eighty thousand servants and seventy-two girls of paradise besides his own former wives if

the case of water being beyond reach, sand may supply its place. 'The religion being founded on cleanliness sufficient that the believer himself should be clean, but even the ground or the carpet he prays must be as clean as possible, and of a special prayer-carpet (Seggâdéh) is recommended. Every Mohammedan is to pray five times in the space of every twenty-four hours. The prayer (Salah) itself consists of extracts from the Revealed Book, the Koran, partly of pieces ordained by the Prophet, partly of a divine order (Sunnah). The time of prayer commences at the Maghrib, or sunset; the second, at the Eshâ, or nightfall; the third, at the Subh, or daybreak; the fourth, at the Duhr, or about noon; the fifth, at the Asr, or afternoon. The believers are not to commence prayers exactly at sunrise, or noon, or sunset, lest they might be confounded with the idol worshippers. These several times of prayer are announced by the Mu'addins (q. v.) from the minarets or madnehs of the mosques. Their chant is a very simple but solemn melody, soundly and sonorously down the height of the mosque, through the mid-day din and the evening adhan, but its impression is one of the most strikingly poetical in the stillness of night; so that even many Europeans cannot help exclaiming, 'Allah! Allah!' imitating the Prophet on his preferring the voice to either the Jewish trumpet-call of the Temple, or the Christian church-day-call (the Adan) consists chiefly of the recitation of the verses of faith (God is most great—Mohammed is the apostle—come to prayer, come to security). The night-calls (Ula, the first, and the second), destined for persons who perform supererogatory acts of devotion, are longer. The believer often changes his position during his prayers; and a certain number of inclinations of head and knees, prostrations, is called a Rekah. It is also necessary that the face of the worshipper should be turned towards the Kibleh, in the direction of Mecca. The exterior wall of the mosque marking the place of prayer is distinguished by a niche (Mihrab), and the sumptuous and pompous apparel is laid out on the floor. When the believer approaches the sacred place

## MOHAMMEDANISM.

propagators of Islam, need, after what we said under MOHAMMED, not be dwelt upon here. For the particulars of the service in the Mosque, the reader is referred to that heading. It may be remarked in passing, that Mohammedanism has no clergy in our sense of the word, the civil and religious law being bound up in one. See also MOLLAH, MUFTI.

Next in importance stands the duty of giving alms. These are twofold—legal (Zekah) and voluntary (Sadakah; Heb. Zedakah, piety, righteousness); but the former, once collected by the sovereign, and applied to pious uses, has now been practically abrogated. The Sadakah is, according to the law, to be given once every year, of cattle, money, corn, fruits, and wares sold, at about the rate of from two and a half up to twenty per cent. Besides these, it is usual to bestow a measure of provisions upon the poor, at the end of the sacred month of Ramadan.

The duty of fasting follows. [FASTS.] During the whole month of Ramadan, the Moslem is commanded to refrain from eating, drinking, smoking, smelling perfumes, bathing, and every unnecessary indulgence in worldly pleasure, from daybreak until sunset. From that period till the morning, he is allowed to eat, drink, and enjoy himself. The Arabian years being lunar, it often happens that Ramadan falls in midsummer, when the fasting, more especially the abstaining from drinking, is excessively mortifying. None are exempt from this duty save the sick, travellers, and soldiers at a time of war; but they are bound to fast an equal number of days during some other months. Nurses and pregnant women are entirely free from fasting. It is Mohammed's special and express desire, that no one should fast who is not quite equal to it, lest he might injure his health, and disqualify himself for necessary labour. Of the other commendable fast-days, the Ashura, on the 10th of Moharram (the Jewish Jom Kippur), deserves special mention. There are very few Moslems who do not keep the Ramadan, even if they neglect their other religious duties; at all events, they all pretend to keep it most strictly, fasting being considered 'one-fourth part of the faith,' nay, 'the gate of religion.'

Of the fourth paramount duty of the Mohammedan—viz., the pilgrimage to Mecca—we have spoken both under that heading, and, more fully, in the article HAJJ. Suffice it here briefly to recapitulate, that the Kaaba (q. v.) is to be encompassed seven times, the celebrated black stone being kissed at each round, that Mount Arafat is to be visited, the sacrifice El-Fida (the Ransom, in memory of Isaac's sacrifice) to be performed, and a number of minor ceremonies to be gone through by the pilgrim, and that he who neglects to perform the sacred pilgrimage, 'might as well die a Jew or a Christian.'

To the 'positive' ordinances of Islam may also be reckoned the 'Saghir,' or minor, and 'Kebir,' or great festivals. [FESTIVALS.] The first (Al-Idr, or breaking the fast), following immediately upon the Ramadan, begins on the first day of the month of Shawal, and lasts three days. The second (Ed Al-Kurban, or sacrifice) begins on the 10th of Muharrag, when the pilgrims perform their sacrifice, and lasts three or four days. Yet, although intended to be the most important of the two, the people have in most places changed the order, and, by way of compensation for the previous fast, they make the lesser festival which follows the Ramadan the most joyful and the longest of the two. The day set aside for the weekly day of rest is the Friday—not, as is generally supposed, because both the Jewish Sabbath and the Christian Sunday were to be avoided, but because, from times long before

Mohammed, the people used to hold public assemblies for civil as well as religious purposes on that day. The celebration of the Moslem days of religious solemnity is far less strict than is the custom with the other Shemitic religions. Service being over, the people are allowed to return to their worldly affairs, if they cannot afford to give themselves up entirely to pleasure or devotion for the rest of the sacred period.

Thus far, briefly, the principal positive laws of Islam relating to faith and practice. We shall now touch upon the fundamental prohibitory laws contained in the Koran.

First of all, the drinking of wine, which includes all strong and inebriating liquors, as giving rise to 'more evil than good,' is rigorously forbidden; and although of late, chiefly through European influence, very many Moslems have lost their religious scruples on that score, and not only secretly, but openly indulge in spirits, yet the great bulk of the faithful refuse even to make use of the proceeds of the sale of wine or grapes. Some over-scrupulous believers even include opium, coffee, and tobacco in the prohibition; but general practice has decided differently. The prohibitory laws respecting food resemble closely those of Judaism: blood, the flesh of swine, further, animals which have died from disease or age, or on which the name of some idol has been invoked, or which have been sacrificed unto an idol, or which have been strangled, or killed by a blow, a fall, or by some other beast, are strictly forbidden. 'Pure' animals must be slaughtered according to certain fixed rules, and the name of God is to be invoked before the operation, without, however, the usual addition of the benevolent epithets, since these would ill befit the sufferings of a fellow-creature. Fish, birds, game are mostly allowed for food, yet there are in nearly all cases certain religious ceremonies to be observed, before they become fit for the believer's table.

All games subject to chance ('casting lots by arrows')—such as dice, cards, tables, bets, &c.—are considered so wicked, that a gambler's testimony is invalid in a court of law. (The Talmud only rejects the testimony of the habitual 'dice' [Kubia, i. e., Cube] gambler and better upon doves.) Chess and other games depending on skill—provided they do not interfere with the regular performance of religious duties, and that they are played without any stakes whatsoever—are allowed by the majority of Moslem theologians. Usury is strictly prohibited. Taking interest upon any loan, however large or small, or profiting in trade through any questionable means, save by buying and selling, is severely condemned.

To prevent the faithful from ever falling back into idolatry, the laws relating to images and pictures have been made very stringent. Whosoever makes an imitation of any living being in stone, wood, or any other material, shall, on the day of judgment, be asked to endow his creation with life and soul, and, on his protesting his inability of doing so, shall undergo the punishment of hell for a certain period.

The civil and criminal laws of Mohammedanism, founded both on the Koran and the Traditions (Sunna), are, in some instances, where the letter of the written or oral precept allows of various explanations, or where the case in question is not foreseen, interpreted according to the opinion of one of the four great masters of Islam: Abu Hanifa, Malec Ibn Ans, Shafel, Ibn Hanbal, within the pale of their respective sects. The principal points, however, upon which all Mohammedans agree are the following: Polygamy is allowed, not, as is commonly supposed, without any restriction, but: 'Take in marriage of the women who please you, two,

## MOHAMMEDANISM.

three, or four; but if ye fear that ye cannot act equitably, one; or those whom your right hands have acquired—i.e., your slaves. These are the explicit words of the Koran (iv. 3), so that four wives, and a certain number of concubine slaves, is the whole extent to which a Moslem may legally go. The Prophet's example proves nothing to the contrary, since he was endowed with special privileges, and not subject to the common law in many respects. It is, moreover, added, as an advice, that to marry one or two is quite sufficient for a man, if he apprehend any inconvenience from a larger number of wives. A Moslem may, if urged by excessive love, or if unable to obtain a wife of his own creed, marry a Christian woman or a Jewess, but a Mohammedan woman is not, under any circumstances, to marry an unbeliever. In all cases, however, the child born of a Moslem, whatever the mother's faith, is a Moslem; nor does the wife, who is an unbeliever, inherit at her husband's death. Forbidden degrees are: the mother, daughter, sister, half-sister, aunt, niece, foster-mother, or a woman related to the faithful 'by milk in any of the degrees which would preclude his marriage with her, if she were similarly related to him by consanguinity;' the mother of his wife, even if he be not properly married to the latter yet; the daughter of his wife, if the latter still be his legal wife; his father's wife and his son's wife; or two sisters at the same time; or wives who stand to each other in the relation of aunt and niece; or the unemancipated slave, or another man's slave, if he have already a free wife. A simple declaration of a man and woman at the age of puberty, before two witnesses, of their intention to marry each other, and the payment of part of the dowry (which is indispensable, and must amount to at least ten dirhems, or about five shillings), is sufficient for a legal marriage. A girl under age is given away by her natural or appointed guardian, with or without her consent. To see the face of any woman who is neither his wife nor his concubine, nor belongs to any of the forbidden degrees, is strictly forbidden to the believer. Divorce is a comparatively light matter with the Mohammedans. Twice, a man may send away his wife and take her back again without any ceremony; the third time, however—if he unite the triple divorce in one sentence at once—he dare not receive her again in wedlock until she have been married properly to another man in the meantime. Mere dislike is sufficient reason for a man to dissolve the conjugal ties, and his saying: 'Thou art divorced,' or 'I divorce thee,' together with the payment of part of the wife's dowry, is all that is required from him by the law. A wife, on the other hand, is bound to her husband for ever, unless she can prove some flagrant ill-usage or neglect of conjugal duty on his part; and even then, she forfeits part, or the whole, of her dowry. A divorced woman is obliged to wait, like a widow, for a certain period before marrying again: if pregnant, until delivery; three months, or four months and ten days, according to circumstances. If she have a young child, she is to suckle it until it be two years old, and the father is to bear all the expenses of the maintenance of mother and child. A woman proving disobedient to her husband, may be declared by the kadi 'nāshizeh,' i.e., rebellious, and the husband is no longer bound to maintain her. Yet, he cannot be forced to divorce her under these circumstances, so that the woman is generally in so sore a plight that she is obliged to promise good-behaviour for the future, and the husband has then either to take her back to his house, or to set her free by a formal divorce. On the other hand, it often happens that a woman prefers a mere separa-

tion, to continuing to live with her husband; in which case she gets herself, of her own accord, inscribed a 'nashizeh.' If a slave becomes a mother by her master, and he acknowledges the child to be his own, the latter is free, and the mother is to be emancipated at the master's death, and may not be given away, or otherwise disposed of by him, during his lifetime. A free person, wishing to marry his or her slave, must first emancipate this slave; and if the slave of another person has been married by a free man or woman, and afterwards becomes the latter's property, the marriage becomes illegal, and can only be renewed by a legal contract and emancipation.

The privilege of primogeniture does not exist in the Mohammedan law, but males generally receive a double share. A person may not bequeath more than one-third of his property, unless there be no legal heirs. Children, whether begotten with the legal wife, or slave, or concubine, or only adopted, and their descendants, are the first heirs; next come the claims of wives, parents, brothers, sisters, in their order. Where there is no legal heir, the property falls to the crown.

The law is very lenient towards debtors, the Koran recommending the creditor to remit a debt 'as alms.' Insolvency and inability to work for the discharge of the claim, solve all further obligations. The most conscientious performance of all private contracts, however, is constantly recommended in the Koran.

Murder is either punished with death, or by the payment of a fine to the family of the deceased, according to their own pleasure. There must, however, be palliating circumstances in the latter case. The Bedawis, however, have expanded the law of blood-revenge in a terrible manner, and up to this day the 'vendetta' often rages not only between family and family, but between whole tribes, villages, and provinces. Unintentional homicide is expiated by freeing a believer from slavery, and paying to the family a certain sum in proportion to the rank and sex of the deceased. He who has not the means of freeing a believer, is to fast for two months, by way of penance. According to the strict letter of the law, a man is not liable to capital punishment for killing his own child or an infidel; but, practically, no difference is generally made by the Mohammedan governments (chiefly the Turkish) in our day. Murder is punished with death, and no fine frees the culprit.

The Mosaic law of retaliation, in case of intentional wounds and mutilation, holds good also for Islam; that is (not, as has ignorantly been supposed, that the corresponding limb of the offender is to be cut off), a certain proportionate fine or money is to be paid to the injured. The payment for any of the single limbs of the human body—e.g., the nose—is the full price of blood, as for a homicide; for a limb which is found twice, like hand or foot, half; for a finger or toe, the tenth part, &c. Women and slaves have smaller claims. Injuries of a dangerous, or otherwise grievous nature, pay the full price; those of an inferior kind, however, bring the perpetrator within the province of the lash or cudgel, which is supposed to have 'come down from heaven, to be used by the judge for the promotion of virtue and duty.'

The Koran orders theft—of no less than the value of half-a-crown—to be punished by cutting off the chief offending limb: the right hand; the second theft is punishable by the loss of the left foot; the third, of the left hand; the fourth, of the right foot, &c.; but the ordinary punishments of imprisonment, hard labour, and the bastinado, have been substituted in our days. The property stolen must not, however, have been of easy access to the thief, nor

## MOHAMMEDANISM.

must it have consisted of food, since he may have taken this to satisfy the craving of his hunger.

Unchastity on the part of a woman was, in the commencement of Islam, punished by imprisonment or life, for which afterwards, however, stoning was substituted in the case of a married woman; and a hundred stripes and a year's exile in the case of an unmarried free woman; a slave to undergo only half of that punishment. Yet, it is necessary that he who accuses a 'woman of reputation' of adultery or fornication, shall produce four (male) witnesses, and if he be not able to do so, he is to receive fourscore stripes, nor is his testimony ever after to be received, for he is considered an 'infamous prevaricator'—unless he swear four times that he speaks the truth, and the fifth time imprecate God's vengeance if he speak false. Yet, even this testimony may be overthrown by the wife's swearing four times that he is a liar, and imprecating the fifth time the wrath of God upon herself, if he speak the truth. In the latter case, she is free from punishment; the marriage, however, is to be dissolved. Fornication in either sex is, by the law of the Koran, to be visited with a hundred stripes.

Infidelity, or apostasy from Islam, is a crime to be visited by the death of the offender, if he have been warned thrice without recanting. Severer still, that is, not to be averted by repentance or evocation of any kind, is the punishment inflicted for blasphemy—against God, Mohammed, Christ, Moses, or any other prophet. Instantaneous death is the doom of the offender; for if apostasy may be caused by error and misguidance, 'blasphemy is the sign of complete wickedness and thorough corruption of the soul.'

A further injunction of the Koran, for the carrying out of which, however, the time has well-nigh come by, is that of making war against the Infidels. He who is slain while fighting in defence and for the propagation of Islam, is reckoned a martyr; while a deserter from the holy war is held up as an object of execration, and has forfeited his life in this world as well as in the world to come. At first, all the enemies taken in battle were ruthlessly slain; later, however, it became the law to give the people of a different faith against whom war was declared the choice of three things: either to embrace Islam—in which case they became Moslems and free in their persons and fortunes, and entitled to all the privileges of Moslems; or to submit to pay tribute—in which case they were allowed to continue in their religion, if it did not imply gross idolatry or otherwise offended against the moral law; or to decide the quarrel by the fortune of war—in which case the captive women and children were made slaves, and the men either slain, unless they became converts at the last moment, or otherwise disposed of by the prince. The fifth part of the spoil belongs 'to God,' that is, to the Sanctuary (Kaaba, &c.), to the apostle and his kindred, to the orphans, the poor, and the traveller.

We need hardly urge, that the Koran is not systematically arranged code, and that all the laws and regulations hitherto enumerated, although contained in it, either bodily or, as it were, in germs further developed by the Sunna (q.v.)—are to a great extent only mentioned in an incidental manner, thrown together and mixed up, often in the strangest manner, with the most heterogeneous dicta, legends, moral exhortations, civil and criminal laws, &c., and are principally to be considered as supplementary to the existing laws and regulations which may either be abrogated, confirmed, or extended, according to the pressing demand of circumstances during the Prophet's life. In cases for which subsequent ages found no written rules laid down by

the Prophet, traditional oral dicta were taken as the norm, and later still, precedents of the Khalifs were binding. Hence contradictions in theory and practice have crept in, according to the different traditions and decisions of the Imams or expounders of the Law, besides the various interpretations put upon the book itself within the pale of the different Mohammedan sects. The secular tribunals, therefore, not unfrequently differ in their decisions from the judicial tribunals; and the distinction between the written civil Law of the ecclesiastical courts and the common Law, aided by the executive power, is, fortunately for the cause of human culture, and the spread of civilisation, getting clearer and clearer every day.

That part of Islam, however, which has undergone (because not to be circumscribed and defined by doctors) the least changes in the course of time, and which most distinctly reveals the mind of its author, is also its most complete and its most shining part—we mean the ethics of the Koran. They are not found, any more than the other laws, brought together in one, or two, or three Surahs, but 'like golden threads' they are woven into the huge fabric of the religious constitution of Mohammed. Injustice, falsehood, pride, revengefulness, calumny, mockery, avarice, prodigality, debauchery, mistrust, and suspicion are inveighed against as ungodly and wicked; while benevolence, liberality, modesty, forbearance, patience and endurance, frugality, sincerity, straightforwardness, decency, love of peace and truth, and above all, trusting in God, and submitting to His will, are considered as the pillars of true piety, and the principal signs of a true believer. Nor must we omit to point out expressly that Mohammed never laid down that doctrine of absolute predestination and 'fatality' which destroys all human will and freedom, since the individual's deeds cannot alter one iota in his destiny either in this world or in the next. So far from it, foolhardiness is distinctly prohibited in the Koran (ii. 196). Caution is recommended. Prayer, the highest ceremonial law of Islam, is modified in case of danger. It is legal to earn one's livelihood on Friday after prayer, and to shorten the readings in the Koran for the sake of attending to business. All of which is enough to shew that the Moslem is not to expect to be fed pursuant to a Divine decree whether he be idle or not. On the other hand, a glance at the whole system of faith, built on hope and fear, rewards and punishments, paradise and hell, both to be man's portion according to his acts in this life, and the incessant exhortations to virtue, and denunciations of vice, are sufficient to prove that aboriginal predestination, such as St Augustine taught it, is not in the Koran, where only submission to the Lord's will, hope during misfortune, modesty in prosperity, and entire confidence in the Divine plans, are supported by the argument, that everything is in the hands of the Highest Being, and that there is no appeal against His absolute decrees.

And this is one instance of the way in which most of Mohammed's dicta have been developed and explained—both by sectarians and enemies within and without Islam—in such a manner that he has often been made to teach the very reverse of what he really did teach; and thus monstrosities now found in his creed, if carefully traced back to their original sources, will, in most cases, be seen to be the growth of later generations, or the very things he abrogated. That, again, the worst side of his character, the often wanton cruelty with which he pursued his great mission, the propagation of his faith, should by his successors have been taken as a thing to be principally imitated, is not to be wondered at, considering how brilliant the results of the policy

of the bloody sword had proved. Scarcely a century had elapsed after Mohammed's death, and Islam reigned supreme over Arabia, Syria, Persia, Egypt, the whole of the northern coast of Africa, even as far as Spain; and notwithstanding the subsequent strifes and divisions in the interior of this gigantic realm, it grew and grew outwardly, until the Crescent was made to gleam from the spires of St Sophia at Constantinople, and the war-cry 'Allah il Allah!' resounded before the gates of Vienna. From that time, however, the splendour and the power of Mohammedanism began to wane. Although there are counted about 130 millions this day all over the globe who profess Islam, and although it is, especially at this present juncture, making great progress among the African races, yet the number of real and thorough believers is infinitely small; and since it has left off conquering, it has lost also that energy and elasticity which promises great things. Its future fate will depend chiefly, we should say, on the progress of European conquest in the East, and the amount of Western civilisation which it will, for good or evil, import into those parts.

We cannot consider in this place what Islam has done for the cause of all humanity, or, more exactly, what was its precise share in the development of science and art in Europe. We refer to the special articles which treat of these subjects, and particularly to the biographies found in the course of this work of men eminent in every branch of human knowledge who have issued from the ranks of Islam. Broadly speaking, the Mohammedans may be said to have been the enlightened teachers of barbarous Europe from the 9th to the 13th century. It is from the glorious days of the Abbasside rulers that the real renaissance of Greek spirit and Greek culture is to be dated. Classical literature, would have been irredeemably lost, had it not been for the home it found in the schools of the 'unbelievers' of the 'dark ages.' Arabic philosophy, medicine, natural history, geography, history, grammar, rhetoric, and the 'golden art of poetry,' schooled by the old Hellenic masters, brought forth an abundant harvest of works, many of which will live and teach as long as there will be generations to be taught.

Besides the Koran, the Sunna, and the native (Arabic, Persian, Turkish, &c.) writers on the foregoing subject, we mention as further references the works of the European scholars Maracci, Hyde, Prideaux, Chardin, Du Ryer, Reland, D'Herbelot, Sale, De Sacy, Hammer, Burckhardt, Sprenger, Burton, Muir, Garcin de Tassy, Lane, Weil, Geiger, Nöldeke, &c. See also KORAN, MOHAMMED, SHITES, SHAFIITES, SUNNA, &c.

**MOHAWK**, a river of New York, United States, named from a tribe of Indians. It rises in Oneida county, 20 miles north of Rome, and runs east-south-east into the Hudson at Waterford, 10 miles above Albany. It is 135 miles long, and has numerous and picturesque waterfalls, especially at Little Falls, Cohoes, and Waterford, affording abundant water-power. In its populous valley are the Erie Canal and New York Central Railway.

**MOHICANS**, **MOHEGANS**, or **MAHICANNI**, once a powerful and warlike sub-tribe of North American Indians, of the great Algonquin family, which, in the 17th c., inhabited the territory north-north-west of Long Island Sound, and east of the river Hudson, now included in the states of New York, Connecticut, and Massachusetts. Being compelled to give way to the conquering Iroquois confederacy, they retired to the valley of the Housatonic River in Connecticut, and were consequently one of the first tribes who came into colli-

sion with, and were dispossessed of their territory by the early British settlers. They subsequently lived dispersed among the other tribes, and all traces of them have now nearly disappeared. Their name has become widely known through Mr J. Fenimore Cooper's celebrated novel, *The Last of the Mohicans*.

**MOHILEV**, or **MOGILEV**, a government of European Russia, lying between Minsk and Smolensk, contains 18,189 English square miles, with a population of 908,858. The inhabitants are mostly Rusniaks, though there are also many Russians, Germans, Jews, and even Bohemians. The country is generally a plain, with here and there an occasional undulation; the soil is very fertile, and the climate most agreeably mild. Agriculture has here reached a high degree of perfection, and the same may be said of arboriculture and horticulture. The natural pasturage is of fine quality, and affords abundant nourishment to immense herds of cattle. The forests are extensive. The country is watered by the Dnieper and its numerous affluents, which form the means of communication with the Black Sea ports, and of the transit of corn, timber, and masts, of which last large quantities are annually floated down to Kherson. Bog iron-ore is found in abundance. The inhabitants are celebrated for their activity and industry; and M., from its great natural advantages, has now become one of the richest provinces of Russia.

In early times, M. belonged to the territory of the Russian prince of Smolensk, but was subsequently conquered by the Grand Duke of Lithuania, and was, along with Lithuania, united to the kingdom of Poland. In 1772, it was seized by Russia at the first partition of Poland; and in 1796, was joined to the government of Vitebsk, under the name of *White Russia*; but since 1802, it has formed a separate government.

**MOHILEV**, or **MOGILEV**, the capital of the government of the same name in European Russia, and one of the finest towns of Russia, is situated in the centre of the government, on the right bank of the Dnieper, 100 miles south-west of Smolensk. It is the seat of a Greek archbishop, and of the Roman Catholic primate of Russia and Poland, besides being the favourite residence of many of the Russian nobility. It possesses a fine Greek cathedral, built in 1780, 20 Greek, one Lutheran, and 4 Roman Catholic churches, several synagogues, and a variety of religious, educational, and charitable institutions. Its streets are wide, straight, and well paved, and there is a fine promenade bordered with trees, whence a beautiful view of the valley of the Dnieper is obtained. Pop. 38,922, of whom one-third are Jews. There is a large export trade to the chief ports of the Baltic and Black Seas.

**MOHILEV**, or **MOGILEV**, a district town on the south-west frontier of the government of Podolia, European Russia, is situated on the left bank of the Dniester, 50 miles east-by-south from Kaminsk. Pop. 9756. It carries on an active trade with the adjacent Russian provinces, and with the Turkish principalities of Moldavia and Wallachia. The climate is so mild, that silk and other products of warm climates are extensively produced.

**MÖHLER**, **JOHANN ADAM**, one of the most distinguished modern polemical divines of the Roman Catholic Church, was born of humble parents, at Igersheim, in Würtemberg, May 6, 1796. He received his early education at the gymnasium of Mergentheim, whence, in his 17th year, he was transferred, for the higher studies, to the Lyceum

## MOIDORE—MOLDAVIA AND WALACHIA.

vangen; and soon afterwards entered upon theological course in the university of Tübingen, received priests' orders in 1819; and for a short time was employed in missionary duty; but in 1820 he returned to college-life, for two years engaged as classical tutor; but, in 1822, the offer of a theological appointment in the university of Tübingen, finally decided his choice to the study of theology. He was permitted, before entering on his duties, to spend some time in making himself acquainted with the routine of the theological studies of other universities—as Göttingen, Berlin, Vienna, and Landshut; and in 1823, he took upon his new position. In 1828, in which year he was also admitted to the degree of Doctor of Theology, he was appointed ordinary professor of Theology. His earliest publication was a treatise *Unity of the Church* (1825), which was followed in 1827, by a historico-theological essay *Janasius and the Church of his Time, in connection with Arianism*. But his reputation, both at home and among his own contemporaries, was mainly on his well-known *Symbolism; or Doctrinal Differences between Catholics and Protestants, as represented by their Public Confessions of Faith* (1832). This remarkable book fixed the attention of the theological world.

It passed through five large editions in Germany. It was translated into all the leading languages of Europe, and drew forth numerous answers and rejoinders, the most considerable of which is that of Dr F. C. Baur (q. v.), 1833. To this he replied in 1834, by a work entitled, *Further Remarks into the Doctrinal Differences of Catholics and Protestants*. The polemical bitterness evoked by these controversies made it desirable that M. should leave the university of Tübingen. He was transferred to Breslau, and also to Bonn, but ultimately in 1835 the university of Munich, then in the full flush of its efficiency, under King Louis I., appointed him nominally the chair of Exegesis, but he really devoted himself to the department of Church History, in which his course was eminently successful; but, unfortunately, a naturally delicate constitution began to give way under the constant fatigues of a professor's life; and although he continued, under these disadvantages, to maintain and to add to his reputation, and although, in 1837, the invitation to the Bonn professorship was renewed in still flattering terms, he gradually sunk under the strain, and died April 12, 1838. His miscellaneous works were collected and published posthumously, in 2 vols. 8vo (1839—1840), by his son, the now celebrated Dr Döllinger. M. may be regarded as at once the most acute and the most philosophical of the modern controversialists of the church. He deals more, however, with the logical differences of modern sects, than with the discussion of the scriptural or traditional grounds of the peculiar doctrines of any among

**MOIDORE**, a former gold coin of Portugal, of the value of 4800 reis, or nearly 27s. sterling. It is so called *Lisbonine*.

**MOIRÉE**, the French name (formerly *mohère*, and said to be taken from the Eng. *mohair*, which is probably of Eastern origin) applied to silks dyed by the peculiar process called watering. Silks for this purpose must be broad and of a substantial make; thin and narrow pieces will not do; they are wetted, and then folded with great care, to insure the threads of the fabric all in the same direction, and not crossing

each other, except as in the usual way of the web and the warp. The folded pieces of silk are then submitted to an enormous pressure, generally in a hydraulic machine. By this pressure, the air is slowly expelled, and in escaping, draws the moisture into curious waved lines, which leave the permanent marking called watering. The finest kinds of watered silks are known as *Moirés antiques*.—The same process has been applied to woollen fabrics called *Moreen*, which is only an alteration of the word *moire*.

**MOIRÉE MÉTALLIQUE**, a French term applied to tin-plate upon which a peculiar figuring like that caused by frost on windows is produced by dipping plates, in a heated state, into nitromuriatic acid, and then washing with water, to remove the acid. When dry, the plates are varnished or lacquered, and have a pretty effect. The cheapness and ease of the process have made it very common for inferior articles in tin.

**MOISSAC**, a town of France, in the department of Tarn-et-Garonne, on the river Tarn, 15 miles north-west of Montauban. The church of St Pierre dates from the year 1100, and contains some excellent carvings and curious fantastic sculptures. M. is the centre of an important trade in grain. Pop. 9036.

**MO'LA**, a city and seaport of the Italian province of Bari, delightfully situated among gardens and olive groves, on the Adriatic, 13 miles from Bari. It contains fine churches and other edifices, and excellent streets. From all accounts, it seems to have exceedingly little trade of any kind. Pop. 12,181.

**MOLA'SSES**. See **SUGAR**.

**MOLD** (anciently *Monte Alto*; Welsh, *Wyddgrug*), a parliamentary borough in the county of Flint, situated on the Alun, 12 miles west-south-west of Chester. Though Flint is the county town, the assizes and quarter-sessions for the county are held here. The town possesses a good market, a fine old church, and several dissenting chapels. It is connected with England by a branch of the Chester and Holyhead Railway. The neighbourhood abounds with mineral wealth, coal and lead being the principal produce; it has also numerous interesting relics of antiquity—e. g., so-called Druidic circles, Roman roads and encampments, Saxon earthworks, an eminence called *Bryn Beili* (formerly surmounted by a castle), and a castellated building known as the Tower of Rheinalt ab Gruffydd, the two latter having been scenes of frequent contentions between the English and Welsh. Many old families have mansions in the neighbourhood, whose pleasing variety of scenery renders it attractive. Pop. of parliamentary borough (1871), 4534.

**MO'LDIAU** (Bohemian, *Vitava*), the chief river of Bohemia, and an important tributary of the Elbe, rises in the Böhmerwald Mountains, on the south-west frontier, at an elevation of 3750 above the level of the sea, and flows south-east to Hohenfurth, where it bends northward, and pursues that direction to its confluence with the Elbe opposite Melnik, after a course of 276 miles. Its course to the point of confluence is longer than that of the Elbe, and the navigation of that river is greatly facilitated by the body of water which it contributes. It receives on the left, the Wotawa and the Beraun; and on the right, the Luschnitz and the Szawa. The chief towns on its banks are Krumau, Budweis, and Prague. It becomes navigable from Budweis.

**MOLDAVIA AND WALACHIA**, two states forming the so-called *Danubian Principalities*, which, since 23d December 1861, have been united under one

## MOLDAVIA AND WALACHIA.

prince and one administration, and officially bear the single name of RUMANIA. Their political relations have always been so close, that it has been considered best to describe them together.

1. MOLDAVIA (Ger. *Moldau*, Turk. *Bogdan*, or *Kera-Isak*) is bounded on the N. and E. by Russia, on the S. by Walachia and the Danube, and on the W. by the Austrian empire. Greatest length, from north-west to south-east, 280 miles; greatest breadth, 128; area, 18,142 square miles. The country forms, geographically, part of the great undulating pastoral plains or steppes of South Russia, except towards the west, where spurs from the Carpathians give it a somewhat mountainous character. It is watered by the Pruth, the Sereth, and the Danube, and is almost everywhere fertile, producing considerable quantities of grain, fruit, and wine. The forests of M. are also of great extent and importance. But the riches of the country consist mainly in its cattle and horses, of which immense numbers are reared on its splendid and far-stretching pastures; swine and sheep are also numerous; and the rearing of bees, owing to the multitude of lime-trees, is extensively carried on. The great plagues of the land are locusts and earthquakes. Minerals and precious metals are said to be abundant, but they have not as yet been worked. There are only a few salt-pits near Okna, in the Carpathian Mountains. Trade is almost exclusively in the hands of the numerous Jews, Armenians, Greeks, and Russians who have settled in the country. The capital of M. is Jassy (q. v.); but the great centre of trade is Galacz (q. v.), where, of late, several British merchants have established houses. The principal exports are grain, wool, lambs' skins, hides, feathers, maize, tar, tallow, honey, leeches, cattle, and salt (in blocks); the imports are chiefly the manufactured products of Western Europe. M. is divided into 13 districts, each of which has a prefect or governor, a receiver-general of taxes, and a civil tribunal consisting of a president and two other judges.

2. WALACHIA, the larger of the United Danubian Principalities, is bounded on the N. by the Austrian empire and Moldavia, on the E. and S. by the Danube, and on the W. by the Austrian empire and the Danube. Length from the western frontier to Cape Kaliakra on the Black Sea, 305 miles; greatest breadth, 130 miles; area, 27,500 square miles. The greater part of W. is quite flat; but in the north, where it borders on Hungary and Transylvania, it gradually rises up into a great mountain-wall, impassable save in five places. It is destitute of wood throughout almost its whole extent; and especially along the banks of the Danube, is covered with marshy swamps, miles upon miles in breadth. The principal river flowing through the country is the Aluta, which joins the Danube at Nikopol. The climate is extreme; the summer heats are intense; while in winter, the land lies under deep snow for four months. The principal products are corn, maize, millet, wine, flax, tobacco, and olive-oil. The vast treeless heaths afford sustenance to great herds of cattle, sheep, and horses. As in Moldavia, agriculture is an important branch of industry; and the swampy districts of the south are haunted by immense numbers of wild water-fowl. In minerals—especially gold, silver, copper, and rock-salt—the soil is rich, but only the last of these is extensively worked. W. is divided into 18 districts, with similar officers to Moldavia. Capital, Bucharest. The population of the two states, according to the *Almanach de Gotha* for 1874, amounts to 4½ millions.

**Administration.**—The ruler of the Principalities—officially called by the Sublime Porte, *Voivod* (Prince); by the Turks generally, *Ijauer-Effendi*

(Lord of the Unbelievers); and by the Rumanians, *Hospodar* (Prince)—receives his investiture from the sultan, but is otherwise independent. By the treaty of Paris (30th March 1856) and the Convention (19th August 1858), M. and W. were politically united under one prince, with a special ministry for each country, two elective assemblies, and a central commission, which had its seat at Fokshani. But in November 1861, the sultan sanctioned the administrative union of the two states; and in the following month, it was publicly proclaimed at Bucharest and Jassy. The first ruler of Rumania, Prince Alexander John Couza, was forced to abdicate in 1866, when Karl I., son of the prince of Hohenzollern-Sigmaringen, was chosen his successor. At the same time, a new and more popular constitution was adopted by a constituent assembly elected by universal suffrage. The legislative power is vested in two houses, a senate and a chamber of deputies. The former consists of 76, and the latter of 117 members, of whom 82 are for W. and 75 for Moldavia. The members of both houses are chosen by indirect election—i. e., the first voters nominate electors, who choose the members. All citizens who have reached their 25th year, and who can read and write, are voters in the first instance, and every Ruman who possesses a small yearly income is eligible for a seat in parliament. The prince has a suspensive veto over all laws passed by both chambers. He is also chief of the executive, which is composed of a council of seven ministers, heads of the departments of the Interior, of Foreign Affairs, of War, of Finance, of Justice, of Commerce and Agriculture, and of Religion and Public Instruction. Judges are removable at the pleasure of the superior authorities. The legal codes are founded upon the civil law and the customs of the Principalities; but though the system of jurisprudence has been much amended, many reforms remain to be effected, especially in the administration of the laws, which is said to be most corrupt.

**Religion.**—The established religion of Rumania is that of the Greek Church, to which nearly the whole population belong; but all forms of Christianity are tolerated, and their professors enjoy equal political rights. At the head of the Greek clergy stand the metropolitan archbishops of M. and W., the latter of whom is primate of Rumania. Every bishop is assisted by a council of clergy, and has a seminary for priests; the superintendent of the preaching clergy is the *Proto-pope* of the diocese. The ecclesiastical wealth of the country was formerly very great, but the increased expenditure that followed the union of the two states rendered a scheme of spoliation the only means left to the government to extricate itself from its difficulties—in a word, the convent-properties were wrested from the hands of the Greek monks, and placed under the administration of the state. It had been the fashion to establish such convents in Turkey as supports to the orthodox faith, and the institutions in the Principality itself were richly endowed in land and other ways: it was resolved to apply the revenues to the relief of national needs, such as schools, hospitals, the support of the poor, &c., and to give only the overplus to the clergy. This has considerably increased the revenue of the state. The administration, however, is now put upon a better footing.

**Education.**—There are 2000 elementary schools, 5 normal schools, 13 gymnasia, and 2 universities, besides 2 academies of art and 2 of music, which are both failures. Education is gratuitous and compulsory. There are numerous French boarding-schools, and French is now the language of the educated circles, especially ladies (as Greek used to

bel, but the state language and the proper national tongue is the Rumanian.

**Army.**—The military force of Rumania is organized on the plan of the Russian army, and the staff-officers are principally Russian. The militia is formed by the peasantry in the proportion of two men for every 100 families; but along the banks of the Danube, all the inhabitants capable of bearing arms are organized into a military force. By the law of 1872, all natives of Rumania from twenty to forty are liable to military service in the standing army, four years active and four in the reserve. The militia is composed of all who have been in the standing army at any age between twenty and thirty-six. In 1873, the entire Rumanian military force numbered 60,787 men, but of these only 18,333 belonged to the regular army.

**Commerce.**—The total value of the imports of Rumania in 1871 amounted to 89,000,000 lei (= a franc) or about £3,708,330; and of the exports, 172,000,000 lei, or about £7,033,330. The principal article of export is grain, especially wheat and maize. Rumanian industry has largely profited by the construction in recent years of several lines of railway. In 1869, the first line, 42 English miles in length, was opened from Bucharest to Giurgevo on the Danube, and in subsequent years to 1873, a network of railways was completed, connecting the capital with Western Europe through the towns of Pivesti, Iasi, Braila, Tekutch, Roman, and Suceava, and from thence to Lemberg in Austria. In 1872 there were also 2160 miles of telegraph in the Principalities. The revenue in 1871 was £2,735,840; the expenditure, £2,766,338, and the public debt, a little over £1,000,000.

**Race, Language, and Literature.**—The great majority of the inhabitants are known in Western Europe as Walachs, but they call themselves *Aromeni*. The Walachs, however, are not confined to the Principalities, but inhabit also the southern part of Bukovina, the greater part of Transylvania, Eastern Hungary, a part of the Banat, Bessarabia, some districts in Podolia and Kherson, and portions of Eastern Servia. They are also found in Macedonia, Albania, and Thessaly. They are a mixed race, produced by the amalgamation of the Emperor Trajan's Roman colonists with the original Dacian population, and subsequently modified by Grecian, Gothic, Slavic, and Turkish elements. This mixture is seen in their language, three-fourths of the words of which are Latin (the Dacian has disappeared), while the remaining fourth is made up of words from the other four languages. Walachian literature is rich in popular songs; since the 16th c., many works in prose and verse have been printed, and of late years, two political journals in the Walachian tongue have been established, one at Bucharest, and another at Jassy. A *Grammatica Daco-Romana* was published by Johann. Alexi (Vienna, 1826); and a *Historia Lingua Daco-Romana* by Laurianus (Vienna, 1849). A large Latin-Romanian-Hungarian Dictionary was carefully executed by the bishop of Fogarasch, Joh. Bob (3 vols. Klausenburg, 1839).

**Social Condition.**—Very recent statistics on this point are not attainable. In M., there are rather more, in W., considerably more than 3000 bojars, besides whom there is an extensive inferior nobility. In W., every twenty-eighth man is a nobleman; every one hundred and thirty-third, a merchant; and in the capital, every twentieth is a merchant. The free peasants, or yeomen, called *Reseschs*, are not numerous—in all W., there are under 5000. Peasant communities are an important element in the population; upwards of 150,000 of this mysterious class are or were serfs belonging to the rich bojars

and the monasteries. In 1844, about 30,000 were emancipated, and settled in colonies in different parts of the land: they call themselves *Romnitschel* or *Romni*. The common people are on the whole good-humoured, frugal, sober, and cleanly; murder and larceny are almost unknown. Their dwellings, however, are, as may be supposed, of the most wretched description; composed chiefly of interlaced willow-withes, covered with mud, cane, and straw.

**History.**—In ancient times, M. and W. formed an important part of Dacia (q. v.), and the two countries have in general experienced the same vicissitudes. At the period of the migration of nations, and in the following centuries, they were the scene of the struggles between the Gothic, Hunnic, Bulgarian, and Slavic races—the Avari, Chazars, Petschenegi, Uzi, and Magyars, who alternately ruled or were expelled from the country. These peoples all left some traces (more or less) of themselves among the Romanised Dacian inhabitants, and thus helped to form that composite people, the modern Walachs, who, in the 11th c., were converted to the Christianity of the Eastern or Greek Church. Their incursions, however, frightfully devastated the country. In the 11th c., the Kumans, a Turkish race, established in M. a kingdom of their own. Two centuries later, the great storm of Mongols broke over the land. It now fell into the hands of the Nogai Tartars, who left it utterly wasted, so that only in the forests and mountains was any trace left of the native Walachian population. In the latter half of the 13th c., a petty Walach chief of Transylvania, Radu Negru of Fogarasch, entered W., took possession of a portion of the country, divided it among his bojars (noble followers), founded a senate of 12 members, and an elective monarchy; and gradually conquered the whole of Walachia. Rather less than a century later (1354), a similar attempt, also successful, was made by a Walach chief of the Hungarian Marmarosch, of the name of Bogdan, to re-people Moldavia. In the beginning of the 16th c., both Principalities placed themselves under the protection of the Porte, and gradually the bojars lost the right of electing their own ruler, whose office was bought in Constantinople. After 1711, the Turks governed the countries by Fanariot princes (see FANARIOTS), who in reality only farmed the revenues, enriched themselves, and impoverished the land. In 1802, the Russians wrested from Turkey the right of surveillance over the Principalities. A great number of the nobles—through family marriages with the Fanariots—were now of Greek descent, the court-tongue was Greek, and the religious and political sympathies of the country were the same. Hence the effort of the Principalities in 1821 to emancipate themselves from Turkish authority, which was only the prelude to the greater and more successful struggle in Greece itself. In 1822, Russia forced Turkey to choose the princes or hospodars of W. and M. from natives, and not from the corrupt Greeks of Constantinople; and after 1829, to allow them to hold their dignity for life. The Principalities were united, as has been already mentioned, under one ruler in 1858, and under one administration in 1861. See RUMANIA, in SUPP.

**MOLÉ, LOUIS MATTHIEU, COMTE**, a French statesman, and a descendant of the famous French statesman and magistrate, Matthieu Molé (b. 1584; d. 1653), was born at Paris, 24th January 1781. His father, President of the Parliament of Paris, died by the guillotine in 1794. His mother was a daughter of Malesherbes. M. was for the most part his own preceptor, and displayed a wonderfully precocious love of hard work and independent reflection.

## MOLE.

In 1805, he published *Essais de Morale et de Politique*, in which he vindicated the government of Napoleon on the ground of necessity. The attention of the Emperor was drawn to him; he was appointed to various offices in succession, and raised to the dignity of a count, and to a place in the cabinet. After Napoleon's return from Elba, he refused to subscribe the declaration of the Council of State banishing the Bourbons for ever from France, and declined to take his seat in the Chamber of Peers. In 1815, Louis XVIII. made him a peer, and he voted for the death of Ney. In 1817, he was for a short time Minister of Marine, but afterwards acted independently of party, and was one of the principal orators in the Chamber of Peers. In 1830, he became Minister of Foreign Affairs in Louis Philippe's first cabinet, but only for a short time. In 1836, he succeeded Thiers as prime minister; but in the eyes of the liberal party, he displayed too entire a devotedness to the wishes of the king, and thus rendered his ministry very unpopular, so that in 1839 he felt it necessary to resign. In 1840, he was chosen a member of the *Académie Française*. From that time he took little part in political affairs, but after the revolution of 1848 exerted himself, but in vain, to rally and unite the party of order in the assembly to which he had been elected. He died at Champlâtreux, 23d November 1855. M. was fiercely attacked and abused in the latter part of his political career, but it is not now believed that he was servile towards the court. He detested anarchy, and believed in the necessity of a strong government; but he loved genuine liberty, and always placed the constitution above the king. When Louis Napoleon's *coup d'état* extinguished the republic, M. proudly said, that henceforth he could have nothing to do with politics.

**MOLE** (*Talpa*), a genus of quadrupeds of the order *Insectivora*, and family *Talpidae*. All the *Talpidae* live chiefly underground, and their structure is adapted to their mode of life. In their general form, the character of their fur, the shortness of their limbs, the great muscular strength of the fore-parts, and great breadth of the fore-paws, the elongated head, the elongated and flexible snout, the smallness of the eyes, and the complete concealment of the ears, they all resemble the COMMON M. (*T. Europæa*), with which also they pretty nearly agree in the nature of their food, their mode of seeking it, their dentition, and the shortness of their alimentary canal.—The Common M. is abundant in most parts of Europe, except the utmost north and utmost south. In Britain, it is very plentiful, except in the north of Scotland; but is not found in Ireland nor in some of the Scottish islands. Instead of its ordinary uniform black colour, it is occasionally found yellowish white, or gray, and even orange. Its silky or velvety fur lies smoothly in every direction, the short hairs growing perpendicularly from the skin; a peculiarity which preserves it clean as the animal moves either backwards or forwards in its subterranean galleries. The fore-paws are not only very broad, but are turned outwards, for the better throwing back of the earth in burrowing. They are terminated by five long and strong claws. The phalangeal bones are remarkable for breadth, and an elongated bone of the carpus gives additional strength to the lower edge of the paw. The two bones of the forearm are fastened together. The shoulder-blades and the clavicles are very large; and the sternum has an elevated ridge as in birds and bats, for the attachment of powerful muscles. The muscles which move the head are also very powerful, and the cervical ligament is even strengthened by a peculiar bone; the M. making

much use of its flexible snout in burrowing. The hinder limbs are comparatively feeble, and the feet small, with five toes. The eyes are black and very small, capable of being partially retracted and exerted. The senses of hearing, taste, and smell are very strongly developed in the mole. The cutting-teeth are very small and sharp; the canines long and sharp; the true molars broad, with many sharp conical elevations. This dentition adapts the animal for feeding not only on worms and grubs, but also on frogs, birds, and small quadrupeds, which accordingly are its occasional prey, although earthworms are its chief food. The M. is an excessively voracious animal; digestion is rapid, and no long interval can be endured between meals, hunger soon ending in death. When pressed by hunger, it will attack and devour even one of its own kind; and its practice is immediately to tear open the belly of any bird or quadruped which it has killed, and, inserting its head, to satiate itself with the blood. In eating earthworms, it skins them with remarkable dexterity. In quest of them, it works its way under ground, throwing up the earth in mole-hills; more rarely in the fine nights of summer it seeks for them on the surface of the ground, when it is itself up to be picked up by an owl equally in want of food. The habitation of the M. is of very remarkable construction: a hillock of earth larger than an ordinary mole-hill, and containing two circular galleries, one above the other, with five connecting passages, and a central chamber which has access to the upper gallery by three passages; whilst about nine passages lead away from the lower gallery in different directions. The end of a passage entering a gallery

Mole (*Talpa Europæa*):

a, vertical section of the habitation of the mole; b, plan of same.

on one side is never opposite to the end of a passage entering on the other. To afford all facility of escape in case of any alarm, a passage leads at first downwards from the central chamber, and then upwards again till it joins one of the high roads which the M. keeps always open, which are formed by pressing the earth till it becomes smooth and compact, and are not marked by any mole-hills thrown up, and which not only serve for escape when necessary, but lead to those parts of the creature's appropriated domain where the ordinary mining for worms is to be prosecuted. The nest in which the female M. produces her young is in this habitation, but is formed generally under a mole-hill rather larger than usual, where two or three runs meet, and is lined with leaves and other warm materials. The M. breeds both in spring and

## MOLE—MOLESWORTH.

and generally produces four or five young. The attachment of the parent moles is strong, but transitory.

It has been sometimes alleged that moles eat as well as animal food, and that they are to farmers, by devouring carrots and other at it appears rather that they only gnaw in the way of their mining operations, or also, in quest of grubs which they contain. They are generally regarded as a pest by farmers, owing to the injury which mole-hills do to gardens and pastures, the burying up of young and the disturbance of their roots. But they are mainly of use in the economy of nature in digging the excessive increase of some other insects; and probably also contribute to the fertility of some pastures, by the continual tillage they carry on. Mole-traps of various kinds are used, which are planted, if the mole-catcher is a native, in the often-traversed roads of the animals. Digging has long been a distinct trade in

the same M. is abbreviated from the old English *Mouldwarp*, or *Mouldiwarpe*, still provincial, and which is derived from the Anglo-Saxon *moeld*, mould, and *weorpan*, to throw up.

Another species of M. (*T. cæca*) is found in the northern parts of Europe; very similar to the Common M., but rather smaller, and having the eyes covered by the eyelid, so as to justify the statement, that the M. is blind.—A species also very similar to the Common M., is the *North American*.

Among the other *Talpidae* are the *CHANGEABLE TAPE M.* (*Chrysochloris Capensis*) of South Africa, which is remarkable as the only one of the family that exhibits the splendid metallic reflection frequently seen in some other classes of the *SHREW M.* (q. v.) and the *STAR-NOSE* of North America.

E. See *NAEVUS*.

**E-CRICKET** (*Gryllotalpa*), a genus of the Cricket (q. v.) family (*Achetidae* or *Cricketidae*), remarkable for burrowing habits, and for the strength and breadth of the fore-legs. Its legs are also large and strong, but of the

way. The M. feeds both on animal and vegetable substances, and often does no small injury to crops. The chirping, and somewhat musical call of the M., produced in the same way as that of the common cricket, is heard chiefly in the end of spring and beginning of summer, and only in the evening or at night. In some parts of England, this sound has gained it the name of *Chur-worm*. Another local English name is *Croaker*.—The female M. prepares a curious nest, a rounded subterranean cell, about as large as a hen's egg, having a complicated system of winding passages around it, and communicating with it. In this cell, she deposits from 100 to 400 eggs. The young live for some time in society. They run actively, both in the larva and pupa states. The M. is very combative, and the victor generally eats the vanquished.—A species of M. (*G. didactyla*) does great injury to the plantations of sugar-canes in the West Indies.—A curious Indian insect, of a closely allied genus (*Schizodactylus monstrosus*), has prodigiously long wings, which, as well as the wing-covers, are rolled into spiral coils at the tips.

**MOLE-RAT** (*Spalax* or *Aspalax*), a genus of rodent quadrupeds of the family *Muridae*, having teeth almost like those of rats, but in many respects resembling moles, as in general form, shortness of limbs, concealment of ears, smallness or even rudimentary condition of eyes, and burrowing habits—although their food is altogether different, consisting wholly of vegetable substances, and chiefly of roots. One species (*S. typhlus*) inhabits the south of Russia and some parts of Asia. It is also known as the *Podolian Marmot*, *Blind Rat*, *Slepez*, *Zemni*, &c. The M. makes tunnels and throws up hillocks like the mole, but its hillocks are much larger.—Another species, found in the Malayan Archipelago, is as large as a rabbit.—Nearly allied is the *COAST RAT* or *SAND MOLE* of South Africa (*Bathyergus maritimus*), also as large as a rabbit, with, other species of the same genus, also natives of South Africa, which drive tunnels through the sandy soil, and throw up large hillocks.

**MOLESTATION**, in Scotch Law, means disturbing the possession of heritage, and an action of molestation is a remedy for the trespass.

**MOLESWORTH**, SIR WILLIAM, RIGHT HONOURABLE (eighth baronet), English statesman, was born in 1810. Lineally descended from an old Cornish family of large possessions (the first baronet was president of the Council in Jamaica in the time of Charles II., and subsequently governor of that island), he early shewed promise of distinction. His university career at Cambridge was, however, cut short by his sending (under circumstances of great provocation) a challenge to his tutor to fight a duel. He continued his education at the university of Edinburgh, and subsequently at a German university. After making the usual tour of Europe, he returned home, and threw himself, in 1831, into the movement for parliamentary reform. Next year, although only just of age, he was elected member of parliament for Cornwall (East). He sat for Leeds from 1837 to 1841, and then remained out of parliament four years, during which interval he used to say he gave himself a second and sounder political education. He was the intimate friend of Bentham and James Mill, and was regarded as the parliamentary representative of the 'philosophical Radicals.' Having been a great admirer of Hobbes, he accumulated materials for a life of the 'Philosopher of Malmesbury,' which remains in MS. uncompleted. In 1839, he commenced and carried to completion, at a cost of many thousand pounds, a reprint of the entire miscellaneous and voluminous writings of that eminent author. The publication was a valuable

Cricket, and Eggs (*Gryllotalpa vulgaris*).

in the family.—The best known species (*G. vulgaris*)—common in many parts of Europe, and abundant in some places in England, but it is almost two inches long; of a velvety blue; the wings, when folded, do not cover more than one-half of the abdomen, although they are expanded. It uses its fore-legs not only to dig burrows in earth, but for cutting through off the roots of plants which come in its

contribution to the republic of letters, and the works of Hobbes were placed by M.'s munificence in most of our university and provincial public libraries. The publication, however, did him great disservice in public life, his opponents endeavouring to identify him with the freethinking opinions of Hobbes in religion, as well as with the great philosopher's conclusions in favour of despotic government. In 1845, he was elected for Southwark (which he continued to represent until his death), and entered upon a parliamentary career of the greatest energy and usefulness. He was the first to call attention to the abuses connected with the transportation of criminals, and as chairman of a parliamentary committee brought to light all the horrors of the convict system. He pointed out the maladministration of the colonial office, explained the true principles of colonial self-government, prepared draught constitutions for remote dependencies, and investigated the true and natural relations between the imperial government and its colonial empire. M.'s views, although at first unpalatable to the legislature, have been adopted by successive administrations, and are now part and parcel of the colonial policy of Great Britain. In January 1853, he accepted the office of First Commissioner of Public Works, in the administration of the Earl of Aberdeen; and in 1855, the post of Secretary of State for the Colonies, in that of Viscount Palmerston. This appointment gave great satisfaction to our dependencies; but before he could give proof of his administrative capacity, he was (October 22, 1856) struck by the hand of death, while yet in the full vigour of life and intellect. He established the *London Review*, a new quarterly, in 1835; and afterwards purchased the *Westminster Review*, the organ of the 'philosophical Radicals.' The two quarterlies being then merged into one, under the title of the *London and Westminster*, M. contributed to it many able articles on politics and political economy.

**MOLFETTA**, a city of Italy, in the province of Terra di Bari, situated on the Adriatic, 18 miles north-west of Bari; pop. 26,829. The neighbourhood yields excellent fruits, especially almonds and oranges, and has extensive olive plantations. Fish abound along the coast. The city contains a magnificent cathedral, and is partly enclosed by walls; it is conjectured that it occupies the site of some early forgotten town, from the numerous vases, urns, and other relics of antiquity found in its vicinity.

**MOLIÈRE**, JEAN BAPTISTE (properly, *Jean Baptiste Poquelin*—the name of Molière not having been assumed till he had commenced authorship), was born at Paris, 15th January 1622. His father, Jean Poquelin, was then an upholsterer, but subsequently became a valet-de-chambre to the king. Regarding the boyhood of M., almost nothing is known, but his credulous biographers have put together whatever traditionary gossip they could find floating on the breath of society. Voltaire, while recording these *contes populaires*, as he calls them, pronounces them *très-faux*. All that we really are certain of is, that in his 14th year he was sent to the Jesuit *Collège de Clermont* in Paris, where he had for a fellow-student Prince Armand de Conti, and that, on leaving the Collège, he attended for some time the lectures of Gassendi. He was charmed, we are told, by the freedom of thought permitted in speculative science, and, in particular, conceived a great admiration for Lucretius, the Roman poet-philosopher, whom he undertook to translate. Of this translation, only a single passage remains, intercalated in the *Misanthrope* (act ii. scene 4). About 1641, he commenced the study of law, and appears to have even passed as an advocate; but the statement of

Tallement des Réaux that he actually ventured the precincts of theology, is generally rejected. M. detested priests. So gay, humorous, and eyed a humanitarian would have felt quite miserable under the restraints of a monkish life. In 1646 suddenly appeared upon the stage as member of a company of strolling players, which took the name of the *Illustre Théâtre*, and performed at first in the faubourgs of Paris, and afterwards in the provinces. For the next 12 years, we can only catch an occasional glimpse of him. He was playing at Lyons and Bordeaux in 1648, at Narbonne and Toulouse in 1649, at Lyon in 1653 (where his first play, *L'Étourdi*, a comedy of intrigue, was brought out), at Lyons and Narbonne again in 1655, at Orléans during the carnival, and also at Rouen in 1656. During these now obscure peregrinations, he was, although an industrious actor, to have been a diligent student. He read Plautus, Terence, Lucian, and the Italian and Spanish comedies, but without which, indeed, all the rest would have been of little avail—making a constant use of quick eyes as ever glittered in a Frenchman's. At Paris, by the powerful recommendation of an old schoolfellow, the Prince de Conti, M. got permission to act before the king, who was highly pleased, that he allowed them to establish themselves in the city under the title of the *Troupe de Monsieur*. In 1659, M. brought out *Les Femmes Ridicules*, the fine satire of which—lapis times, however, into caricature—was instantly received and relished. '*Courage, Molière!*' cried the old man on its first representation; '*voilà la véritable comédie.*' The old man was a prophet. Very soon the comedy dated in France from that night. M. the critic, is reported to have said to Chaptain the poet, as they were going out of the theatre: 'Henceforth (as St Remi said to Clovis), we will burn what we have worshipped, and worship what we have burned.' In 1660 appeared *Scaramouche le Cocu Imaginaire*; and in 1661, *L'École des Femmes*, partly founded on the *Adelphi* of Terence, in which M. completely passes out of the region of farce that of pure comic satire—and *Les Fâcheux* the following year. M. married Armande-Grise Béjart, either the sister or daughter (for it is undetermined) of Madeleine Béjart, an actress, with whom he had formerly lived in the French politely call 'intimate relations.' However, there is the slightest ground for saying that the great comedian incestuously married his own daughter, nobody now believes, though revolting calumny was freely circulated even in M.'s lifetime. His literary activity continued brisk as before. Among several pieces begun to this year, the most celebrated is *L'École des Femmes*, which excited, not without reason, the most violent indignation among the clergy and the devout, for there was an excessive indecency in its expression, and the author indulged in a caricature of religious mysteries that could not but be offensive. M. defended himself with incredible ardour in his *Impromptu de Versailles*. *Le Tartuffe*, written in 1664, was prohibited from being brought upon stage; but M. was invited by his literary friends Boileau and others, to read it in a semi-private manner, which he did with the greatest approbation. In 1665, Louis XIV. bestowed a pension of 7000 livres on M.'s company, which now called itself the *Troupe du Roi*. Next year appeared *Le Misanthrope*, the most artistic of all his comedies, shortly after followed by *Le Médecin Malade*. When *Tartuffe* was at last brought upon the stage in 1669, it obtained a superb success. The variety, the contrast of the characters, the exquisite art shewn in the management of

accidents, the abundance of the sentiments, and the wonderful alternations of feeling—laughter, anger, indignation, tenderness, make this, in the opinion of most critics, M.'s master-piece. To the same year belongs *L'Avare*. In 1670 appeared *Le Bourgeois Gentilhomme*, a very pleasant satire on a very prevalent vice among wealthy tradesmen—viz. the vulgar ambition to pass for fine gentlemen. Then came *Les Fourberies de Scapin* (1671), followed by *Les Femmes Savantes* (1672), full of admirable passages; and *Le Malade Imaginaire* (1673), the most popular, if not the best of all M.'s comedies. While acting in this piece, he was seized with severe pains, which, however, he managed to conceal from the audience; but on being carried home, hæmorrhage ensued, and he expired at ten o'clock at night (17th February 1673). As M. had died in a state of excommunication, and without having received the last aids of religion—which, however, he had implored—the Archbishop of Paris refused to let him be buried in consecrated ground; but the king interfered—a compromise was effected, and he was privately interred in the cemetery of St. Joseph, being followed to the tomb by a hundred of his friends with lighted torches. In 1792, his remains were transferred to the Museum of French monuments, from which they were removed to the Lachaise in 1817. M. ranks as the greatest French comic dramatist—perhaps the greatest of all comic dramatists. An excellent edition of his works, with a commentary, a preliminary criticism, and a life, is that by M. Anger of the French Academy (Paris, 1819—1825); but a still more complete one, containing some recently discovered pieces of M., is that by M. Aimé-Martin, commenced in 1845. The books devoted to M. and his works would themselves form a large library.

**MOLINA, LOUIS**, a celebrated Spanish Jesuit theologian, was born at Cuenca, in New Castile, in the year 1535; and having entered the Jesuit society in his 18th year, studied at Coimbra, and was appointed Professor of Theology at Evora, where he continued to teach for 20 years. He died at Madrid in 1600, in the 65th year of his age. M.'s celebrity is mainly confined to the theological schools. His principal writings are a commentary on the *Summa* of St. Thomas (Cuenca, 2 vols. 1593); a minute and comprehensive treatise *On Justice and Right* (Cuenca, 6 vols. 1592; reprinted at Mainz in 1659); and the celebrated treatise on *The reconciliation of Grace and Free-will*, which was printed at Lisbon in 1588, with an appendix, printed the following year. Although it is to the last-named work that M.'s celebrity is mainly due, we must be content with a very brief notice of it. The problem which it is meant to resolve is almost as old as the origin of human thought itself, and had already led, in the 4th c., to the well-known **PELAGIAN CONTROVERSY** (q. v.). In reconciling the freedom of man's will with the predestination of the elect to happiness, and of the reprobate to punishment, M. asserts that the predestination consequent on God's foreknowledge of the free determination of man's will, and, therefore, that in no way affects the freedom of the particular actions, in requital of which man is predestined either to punishment or to reward. God, in M.'s view, gives to all men sufficient grace whereby to live virtuously, and merit happiness. Certain individuals freely co-operate with this grace; certain others resist it. God foresees both courses, and this foreknowledge is the foundation of one or of the other decree. This exposition was at once assailed in the schools on two grounds—first as a revival of the Pelagian heresy, inasmuch as it appears to place the efficacy of grace in the consent

of man's will, and thus to recognise a natural power in man to elicit supernatural acts; second, as setting aside altogether what the Scriptures represent as the special election of the predestined, by making each individual, according as he freely accepts or refuses the grace offered to all in common, the arbiter of his own predestination or reprobation. Hence arose the celebrated dispute between the **MOLINISTS** and the **THOMISTS**. It was first brought under the cognizance of the Inquisitor-general of Spain, by whom it was referred to Pope Clement VIII. This pontiff, in 1607, appointed the celebrated congregation, *De Auxiliis*, to consider the entire question; but notwithstanding many lengthened discussions, no decision was arrived at during the lifetime of Clement; and although the congregation was continued under Paul V., the only result was a decree in 1607, permitting both opinions to be taught by their respective advocates, and prohibiting each party from accusing the adversaries of heresy. The dispute, in some of its leading features, was revived in the Jansenist controversy (see **JANSEN**); but with this striking difference, that whereas the rigorous Jansenists denied the freedom of the will when acted on by efficacious grace, all the disputants in the scholastic controversy—even the Thomists—maintain that, in all circumstances, the will remains free, although they may fail to explain how this freedom is secured under the action of efficacious grace. See **AQUINAS**.

**MOLINISM**, the name given to the system of grace and election taught by Louis Molina (q. v.). This system has been commonly taught in the Jesuit schools; but a modification of it was introduced by the celebrated Spanish divine Suarez (q. v.), in order to save the doctrine of *special election*. Suarez held, that although God gives to all grace absolutely sufficient for their salvation, yet he gives to the elect a grace which is not alone in itself sufficient, but which is so attuned to their disposition, their opportunities, and other circumstances, that they infallibly, although yet quite freely, yield to its influence. This modification of Molina's system is called **CONGRUISM**. Molinism must not be confounded either with Pelagianism or semi-Pelagianism, inasmuch as Molinism distinctly supposes the inability of man to do any supernatural act without **GRACE** (q. v.).

**MOLINOS, MICHAEL DE**, was born of noble parentage at Patadina, in the kingdom of Aragon, December 21, 1627. He received holy orders and was educated at Pampeluna, and afterwards at Coimbra, at which university he obtained his theological degree. After a career of considerable distinction in his native country, M. went to Rome, where he soon acquired a high reputation as a director of conscience and a master of the spiritual life. His private character was in keeping with this public reputation. He steadily declined all ecclesiastical preferment, and confined himself entirely to his duties in the confessional, and in the direction of souls. An ascetical treatise which he published, under the title of *The Spiritual Guide*, added largely to the popularity which he had acquired in his personal relations; but there were not wanting many who, in the specious, but visionary principles of this work, discovered the seeds of a dangerous and seductive error. Among these, the celebrated preacher, F. Segneri, was the first who ventured publicly to call them into question; but his strictures were by the friends of M. ascribed to jealousy of the influence which M. had acquired with the people. By degrees, however, reports unfavourable to the practical results of this teaching, and even to the personal

always present. They usually consist of round vesicles in the neighbourhood of the oesophageal ring, from which they receive a nervous filament. They contain a clear fluid and a small concretion of carbonate of lime, which is sometimes roundish, and sometimes of a crystalline form, and is in a perpetual state of vibration, in consequence of ciliary action in the interior of the vesicle. Whether there are any special *organs of smell and taste* in the M., is still undecided.

The organs of *vegetative* life (of digestion, circulation, &c.) are much more fully developed in the M. than those of *animal* life. The alimentary canal, which presents almost every variety of form from a simple cavity to a complicated intestine, is always

Fig. 2.—Anatomy of the Snail :

a, the mouth; bb, foot; c, anus; dd, lung; e, stomach, covered above by the salivary glands; ff, intestine; g, liver, h, heart; i, aorta; j, gastric artery; l, hepatic artery; k, artery of the foot; mm, abdominal cavity, supplying the place of a venous sinus; nn, irregular canal in communication with the abdominal cavity, and carrying the blood to the lung; oo, vessel carrying the blood from the lung to the heart.

provided with two distinct openings, a mouth and an anus, the latter being often situated (as in the Gasteropoda and Pteropoda) on the right side of the anterior part of the body. The liver is always present, existing in a mere rudimentary form in the Polyzoa, constituting a large part of the body in the acephalous bivalve *M.* (as the mussel and cockle), and a still larger part in the Gasteropoda (as the snail), while in the Cephalopoda it is constructed upon nearly the same plan as in fishes. Other excretory organs, such as salivary glands, pancreas, and urinary organs, are also present in the more highly developed mollusca.

The circulation of the blood is effected (except in the Polyzoa) by means of a distinct heart, which usually communicates with a regular, closed vascular system; but in some cases the venous system is absent, and the blood which has been trans-

arteries to the system in general is a distinct vessels but understands passages enclosed in the tissues, when it reaches the pulmonary apparatus it is transmitted through vessels to a heart. The blood is very abundant of light blue or green color and contains floating corpuscles. In the very beginning there is a distinct vessel containing excepting in the case of the arteries (as, for example,

the openings for the ingress and egress of water are prolonged into tubes or syphons, which are sometimes of considerable length; the tube through which the water enters being termed the *oral* syphon, while that through which it escapes is termed the *anal* syphon (see fig. 3). In all the

Fig. 3.—Anatomy of an Acephalous Mollusc (*Mactra*): m, mouth; s, stomach; ii, intestine; ag, anterior ganglia; pg, posterior ganglia; mu, muscles; a, anus; h, heart; l, liver; f, foot; sh, shell; ma, mantle; b, branchiae; t, tentacula; r, oral, or respiratory syphon; t, anal syphon.

aquatic M. except the Cephalopoda, the renewal of the water in contact with the surface of the gills is mainly due to ciliary action. In the air-breathing gasteropodous M. (of which the snails and slugs are well-known examples), there is a pulmonary sac or bag, into which the air penetrates by an opening on the right side of the body near the neck.

There are considerable differences in the modes of propagation of the mollusca. In the Molluscoids—the Polyzoa and Tunicata—there is both propagation by gemmation (like that of Zoophytes, q. v.) and sexual reproduction, the sexes being distinct in the Polyzoa, and united in the same individual (constituting Hermaphroditism, q. v.) in the Tunicata. In the Lamellibranchiata, or bivalve M., and in the Cephalopoda, the sexes are separate; while in the Gasteropoda the sexes are most commonly separate, although a considerable number are hermaphrodites, which, however, require mutual impregnation to fertilise the ova. The eggs vary greatly in form; in some cases, they are laid separately, but most commonly they are agglutinated together in a mass; while in some marine species many eggs are enclosed in a leathery capsule, while numerous capsules are united to form a large mass. A comparatively few M. produce living offspring, the ova being retained in the oviduct until the extrusion of the young animals.

The M. are widely diffused through time and space. They were amongst the earliest animal inhabitants of our globe, and are everywhere found in fresh and salt water (except at great depths), and in every latitude of the earth. The great majority are marine animals, and it is in the tropical regions that the largest and most beautiful forms are developed. It is impossible to form even an approximate estimate of the number of mollusca. According to Leunis (*Synopsis der drei Naturreiche; erster Theil*,

1860, p. 77), there are 16,732 living, and 4390 fossil species, exclusive of Polyzoa; and it is probable that only a small proportion of the naked or less M. is yet known.

The uses of many species of M. for food are well known to require notice; and as bait fishing, mussels and some other M. are of value.

The animals of this sub-kingdom are divisible into the Molluscoids and the true Mollusca, the former being distinguished from the latter by the very development of the nervous system, which is composed of only a single ganglion, giving off nerves in different directions; and by their propagating by gemmation. The Molluscoids are divisible into: 1. POLYZOA or BRYOZOA. Examples—*Plasma*, *Flustra*. Class 2. TUNICATA. Examples—*Ascid*, *Salpa*. The true Mollusca are divisible into: Class 1. BRACHIOPODA or PALLIOBRANCHIATA. Examples—*Terebratula*. Class 2. LAMELLIBRANCHIATA. Examples—*Oyster*, *Mussel*, *Cockle*. Class 3. GASTEROPODA. Examples—*Snail*, *Cowry*, *Limpet*, *Doris*. Class 4. CEPHALOPODA. Examples—*Cuttle-fish*, *Nautilus*. The distinctive characters of these classes are given in separate articles.

The literature of this subject is very extensive. Amongst the most important works on the subject generally may be mentioned Cuvier, *Mémoires de l'Académie des Sciences, Paris, 1817*, 4to; Lamarck, *Histoire des Animaux sans Vertèbres*, 2d edit., par Deshayes et Milne-Edwards (11 vols. 8vo); Woodworth, *Manual of the Mollusca*; and the third volume of Bronn's great work, published at Leipzig in 1858, entitled *Classen und Ordnungen des Thierreichs*, while for information on the M. of Great Britain the reader is especially referred to Forbes and Hanley, *Molluscan Animals and their Shells* (4 vols. 8vo); Gosse, *A Manual of Marine Zoology for the British Isles*; and Alder and Hancock, *Natural History of the Mollusca* (published by the Ray Society).

**Fossil Mollusca.**—The hard shells of most molluscs fit them for long preservation, and make the most frequent organic remains in the fossiliferous rocks from the Silurian upwards. The tunicate nudibranchiate gasteropods, having no hard parts that could be preserved, are without fossil representatives; the glassy and translucent fragile shells of the pteropoda are only known fossil from species in the Tertiary strata; unless, indeed, comparatively large forms (*Conularia* and *Palæodonta*) from the older rocks have been rightly referred to this order. The remaining four orders—the Brachiozoa, Gasteropoda, Brachiozoa, and Lamellibranchiata—have existed together from the earliest geological period. The tetrabranchiate Cephalopoda were developed in great profusion and variety in the Palæozoic and Secondary periods; and as they decreased the dibranchiate group took their place, and continued to increase in numbers until it reached its greatest development in the seas of our own day. Chambered shells like the pearly nautilus are estimated that over 1400 species are known, of which only five or six exist in the ocean now. Cuttle-fishes and squids, on the other hand, are represented in the Secondary and Tertiary periods by about 100 species, while at least twice as many are known as living species.

The living Gasteropoda exceed the fossil proportion of 4 to 3. This disproportion appears greater when we remember that the fossil record of the present seas is set against the fossil record of thirty different periods, yet it must not be forgotten that we can never be acquainted with more than a fraction of the entire animal life of any

ge. Almost contemporaneous with the first living organisms, this group has gone on increasing to the present time, when the numbers are so great that more than 8000 living species have been recorded. A genus of air-breathing univalves has been described by Lyell, from the coal-measures of Nova Scotia. A single species—a modern-looking *Physa*—has been obtained from the Purbeck limestone, the newest of the Secondary rocks. They are more frequent in Tertiary beds.

The Brachiopoda, or Lamp-shells, like the nautilus group, have their history chiefly written in the rocky tablets of the earth. Of 1300 known species, only 15 are living, and these are comparatively rare, or are at least found in inaccessible localities, whereas, in some periods of the earth's history, as when the chalk and mountain limestone beds were being formed, and especially during the Devonian period, the individuals abounded to an enormous extent. The genus *Lingula*, seven species of which live in the modern seas, can be traced through the intervening strata, down to the first fossiliferous bed, to which, indeed, it gives the name of 'Lingula Bed'; but this species, though externally not to be distinguished from the existing shell, has a pedicle groove in the ventral valve—a character sufficient, perhaps, for the establishment of a different genus. Indeed, none of the genera of the Palæozoic rocks still exist; the want of exact information is the only excuse for the continued application of the names of recent genera to the ancient inhabitants of the globe.

The Conchifera have been gradually increasing in numbers and importance from the earliest period, and they attain their maximum development in the existing seas. The more simple forms, with an open mantle, are common in the Palæozoic strata; the siphonated families, unknown in the older rocks, appear in considerable number in the Secondary strata, and continue to increase upwards. The recent species number about 3000, while the fossil are nearly twice as many.

**MOLLWITZ**, a village of Prussian Silesia, in the government of Breslau, seven miles west of Biege. Pop. 619. To the east of it lies the celebrated battle-field where Frederick II. of Prussia gained his first victory over the Austrians under Marshal Neipperg, April 10, 1741. According to the usual account, Frederick, on seeing his right wing and centre thrown into confusion and routed, put spurs to his charger, and fled from the field; but the advance of three battalions of Prussian infantry stopped the Austrians, while by this time Marshal Schwerin, who commanded on the Prussian left, routed the Austrian right wing, and compelled the whole to retreat. The Austrians suffered immense loss in killed, wounded, and prisoners. The immediate result of this victory was an alliance between France and Prussia, to dissolve which Austria was compelled to surrender the province of Silesia to Frederick, in 1742.

**MOLO**, a city of the Philippine Islands, on an island of the same name, four miles from Iloilo. See **PHILIPPINES**. In ancient times, it was a Chinese colony, and is now occupied by Mestizos and their descendants, most of them having a mixture of Chinese blood. Pop. 16,000.

**MOLOCH** (more correctly **MOLECH**), also **MILKOM**, **MALKOM** (their king), from Heb. *Melech*, king, the chief Ammonite deity (the Chemosh of the Moabites), whose worship consisted chiefly of human sacrifices, purifications, and ordeals by fire, mutilation, perpetual virginity, and the like; practices specially inveighed against in the Mosaic records. Even the stranger who should devote his offspring to this idol was to be put to death by

stoning. It is not quite certain which was the particular manner of this sacrifice. Rabbinical tradition represents Moloch as a human figure of brass or clay, with a crowned bull's head, upon whose extended arms were laid the doomed children. A fire within the hollow statue soon scorched them to death, while their shrieks of agony were deadened by a loud noise made by the priests upon various instruments. But although this description nearly coincides with that of the statue of the Carthaginian Kronos, and although so late a traveller even as Benjamin de Tudela speaks of having seen the remains of an ancient Ammonite temple at Gebal, with the fragments of an idol somewhat corresponding to the above representation, yet nothing certain is known about this point at present; nay, even the burning of the children itself has been questioned; and it is contended, yet without much show of reason, that the victims were merely carried through two pyres of fire by way of solemn purification or baptism. It seems, however, certain that the worship of M., in whatever shape it may have been, was common throughout the Canaanite nations. The Carthaginians, through whom it was probably spread over the whole East, worshipped Kronos in rites of fire and bloodshed; and human beings, children or grown-up persons, prisoners or virgins, were, either on certain periodical festivals, or on sudden emergencies, offered up throughout almost all the lands and islands which the merchant-people of antiquity may be supposed to have touched at. The description of the Kronian statue, as given by classical writers, differs only in that small respect from the one given above, that the child fell, according to the former, from the hands of the god into a burning fire below, instead of being slowly burned to death. On fire-worship in general, which is the main idea of 'Moloch'—probably worshipped originally as the symbol of the sun—we have spoken under **GUEBRES**. The name itself gives no clue to its special nature, nor does any comparison with cognate roots lead any further. Molech, or Melech, is the supreme king or deity of the people, who have enthroned him as their tutelary god. Naturally, the princes of Ammon are the princes of *Malcham* = their (the Ammonites') king or god, and his priests were high in social rank.

Respecting the special history of this worship among the Israelites, we can only say that, although we do not see any more reason to presuppose its wide spread at early times (on account of the frequent occurrence of the word 'king' in doubtful passages), than there is the slightest ground for assuming (as has been done by Daumer and others) that the whole Mosaic religion originated in a Moloch-service (a notion which hardly required a serious refutation for its instant explosion)—yet there is no doubt that it had its secret, although few adherents, even before the Canaanite women in Solomon's harem reintroduced it publicly. The Valley of Hinnom and the Mount of Olives were the chief places of these abominable rites; the former being afterwards adopted as the name for Hell, even in Islam. Not until the time of Josiah was it rooted out from among the people. The word has now become a designation for a kind of irresistible dread influence, at whose shrine everything would be sacrificed, even as the deluded father offered his own child to the terrible idol.

**MOLO'GA**, a district town in the west of the government of Jaroslavl, in European Russia, is situated near the confluence of the Mologa and Volga, 68 miles west-north-west of Jaroslavl. It is a town of great antiquity, and first belonged to the principality of Rostof, afterwards to Yaroslavl, but from 1321 till 1471, it had its own princes. There

## MOLUCCAS.

was formerly an extensive fair at Mologa. At the present time, the timber-trade, and the carriage of goods by river-boats and rafts, occupy the majority of the inhabitants. Pop. (1867) 3715.—The river Mologa is one of the links between the Volga and the Neva.

**MOLUCCAS**, or **ROYAL ISLANDS**, properly so called are Ternate, Tidore, Makian, Motir, and Batjan, lying to the west of Gilolo, and washed by the Moluccas Strait or Passage, which separates Gilolo from Celebes.—Ternate, the most important, is a volcanic mountain with plains at its base. The top is in  $0^{\circ} 48' 30''$  N. lat., and  $127^{\circ} 26' 30''$  E. long. Area,  $33\frac{1}{2}$  sq. m. Pop. 8594, of whom 109 are Europeans. The town is on the east side and contains the sultan's palace, the Dutch residency, Protestant church, government school, &c. The island is fertile and well watered; the natives peaceful. They cultivate, rice, cotton, tobacco, &c., trade with the adjacent islands, and build vessels, from the light skiff and the tent-boat to the war-galley of 60 or 80 rowers, carrying two or more pieces of light artillery.—Tidore is south of Ternate, its north point being  $1^{\circ} 11'$  N. lat., and  $126^{\circ} 7'$  E. long. Area, 33 sq. m. Pop. 8157. The island is a volcano, 5532 feet high, and fertile for 3000 feet. The natives are less gentle, but more industrious than those of Ternate, and diligently cultivate the soil, weave, and fish. They are Mohammedans, and have many mosques. The sultans of Ternate and Tidore are subsidised by and subject to the Netherlands, exercising their authority under the surveillance of the Resident.—Makian lies in  $0^{\circ} 18' 30''$  N. lat., and  $127^{\circ} 24'$  E. long., is very fertile, yields much sago, rice, tobacco, canary-oil, &c., and has important fishings. Pop. 5000. The natives are industrious, make good nets, spin yarns, and weave coarse striped fabrics.—Further north, in  $0^{\circ} 28'$  N. lat., and  $127^{\circ} 29' 30''$  E. long., is Motir, which formerly yielded a considerable quantity of cloves, and later, sent much earthenware to all the Spice Islands.

Batjan, the only remaining Royal Island, lies between  $0^{\circ} 13' - 0^{\circ} 55'$  S. lat., and  $127^{\circ} 22' - 128^{\circ}$  E. long., is 50 miles in length, and 18 in breadth, has many mountain peaks from 1500 to 4000 feet in height, the sources of numerous rivers. The greatest part of this beautiful island is covered with ebony, satin-wood, and other valuable timber trees, which give shelter to numerous beautiful-plumaged birds, deer, wild hogs, and reptiles. Sago, rice, cocoa-nuts, cloves, fish, and fowls are plentiful, and a little coffee is cultivated. Coal is abundant, gold and copper in small quantities. The inhabitants, 1800, who are lazy and sensual, are a mixed race of Portuguese, Spaniards, Dutch, and natives. These islands are all volcanic, Ternate being a mountain, sloping upwards to 5563 feet, to which Tidore bears a striking resemblance. Makian is an active volcano, which, so late as December 1861, threw forth immense quantities of lava and ashes, by which 326 lives were lost, and 15 villages in part or in whole destroyed. Motir is a trachyte mountain, 2296 feet in height; and Batjan, a chain with several lofty peaks. Total population of the M. Proper, 23,551.

To the south-west of Batjan lie the Obi group, consisting of Obi Major, Obi Minor, Typha, Gonoma, Pisang, and Maya, of which Obi Major, in  $1^{\circ} 35'$  S. lat., and from  $127^{\circ}$  to  $128^{\circ}$  E. long., is by far the largest, having an area of 598 square miles. It is hilly and fertile, being covered, like the smaller islands of the group, with sago and nutmeg trees. They are uninhabited, and serve as lurking-places for pirates and escaped convicts. In 1671, the Dutch built a block-house, called the Bril; and a few years later, the Sultan of Batjan sold the group

to them for 800 dollars; but the station being found unhealthy, the company abandoned it in 1738.

The **MOLUCCAS**, or **SPICE ISLANDS**, in the broad use of the term, lie to the east of Celebes, scattered over nearly eleven degrees of lat. and long., between  $3^{\circ}$  S.— $8^{\circ}$  N. lat., and  $126^{\circ} - 135^{\circ}$  E. long., including all the territories formerly ruled over by the sultans of Ternate and Tidore. They are divided into the residencies of Amboyna (q. v.), Banda (q. v.), and Ternate; a fourth residency being Menado (q. v.). Over the northern groups of the Spice Islands, the Netherlands exercise an indirect government, the sultans of Ternate and Tidore requiring to have all their appointments of native officials ratified by the Resident. The southern groups are directly under European rule. The residency of Amboyna contains that island, sometimes called Ley-Timor, or Hia, from the two peninsulas of which it is formed, Bera, the Uliassers group, and the west part of Ceram. That of Banda includes the Banda, Keffing, Key, Arru, and other islands, also the eastern portion of Ceram. Under the residency of Ternate are placed the M. Proper, Gilolo, the neighbouring islands, and the north-west of Papua. In 1871, pop. of the M. and dependencies, 4214 Europeans and 735,800 natives.

Amboyna, the Banda and Uliasser Islands, chiefly supply the cloves, nutmegs, and mace which form the staple exports. The Banda Islands are Neira or Banda-Neira, Great Banda, Ay or Way, Elen, Rozingain, and Goenong-Api, containing an area of 588 square miles. In 1857, pop. 6101, of whom 400 were Europeans; that of the whole residency, 110,302, including the eastern part of Ceram. The principal island of the group is Neira, south-east from Amboyna, in  $4^{\circ} 33'$  S. lat., and  $130^{\circ}$  E. long., separated by narrow straits from Goenong-Api to the west, and Great Banda on the east. The coast is steep, and surmounted by several forts and batteries, which command the straits and roadstead. The town of Neira, on the south side of the island, is the capital of the Dutch residency of Banda, has a Protestant church, school, and hospital. The Banda Islands have a rich soil, and are planted with nutmeg-trees, producing, in 1860, upwards of a million lbs. of nuts, and 275,586 lbs. of mace. The culture has nearly doubled since 1851. Pine-apples, the vine, banana, cocoa-nut, and other fruit-trees thrive, and are abundant. Ay is the prettiest and most productive of the group. Goenong-Api is a lofty volcano. There are wild cows, hogs, and deer; sea-carp and mackerel, which last are dried, and form with sago the food of the slaves. The east monsoon begins in May, and the west in December, and are accompanied with rain and storms. The climate is not particularly healthy.

The Uliassers, which, with Amboyna, produce the cloves of commerce, are Saparoua, Oma or Harouka, and Nousa-Laut. They lie to the east of Amboyna, in  $3^{\circ} 40'$  S. lat., and  $128^{\circ} 33'$  E. longitude, and have an area of  $107\frac{1}{2}$  square miles. Saparoua is the largest, and is formed of two mountainous peninsulas joined in the middle by a narrow strip of undulating grassy land. In 1854, there were 91,124 trees, producing 181,137 lbs. of cloves. The population amounts to 11,665, of whom 7340 are Christians, and have 12 schools, with a very large attendance of scholars.—Oma, separated from Saparoua by a strait of a league in width, has eleven villages, of which Harouka and Oma are the chief. It is mountainous in the south, and has several rivers and sulphurous springs. The produce of cloves, in 1854, amounted to 38,863 lbs.; and the villagers possessed 45,745 cocoa palms, besides other fruit-trees. The woods abound with deer and wild hogs, the rivers with fish. Sago is grown, but not as

## MOLYBDENUM—MOMENTUM.

sufficient quantities to meet the wants of the people, who draw further supplies from Ceram. The beautiful village of Harouka, on the west coast, is the residence of the Dutch Postholder, who is president of the council of chiefs. Here is the head office of the clove-produce. There are two forts on Oma, several churches, and six schools, with 700 pupils. Pop. 7188, one-half Christians, the other Mohammedans.—Noussa-Laut lies to the south-east of Saparoua. It is planted with clove-trees, which, in 1853, produced 120,283 lbs. There are upwards of 30,000 cocoa-nut trees. The inhabitants, who formerly were pirates and cannibals, amount to 3479 souls, are all Christians, and have schools in every village—in 1859, they were attended by 870 pupils.

The clove-tree and the nutmeg are indigenous to all the Spice Islands, but the clove-cultivation is confined to Amboyna and the Uliassers, the nutmeg to the Banda Islands. Till 1824, the Dutch prohibited the planting of these trees in other parts, and caused those of native growth to be rooted out, in order to prevent smuggling, and to retain the supply of these spices to the European market. The Spice Islands are generally healthy both for Europeans and Asiatics; and though the plains are sometimes very hot, mountains are always near, where it is pleasantly cool in the mornings and evenings. Besides the spice-trees, the bread-fruit, sago, cocoa-nut, banana, orange, guava, papaw, also ebony, iron-wood, and other valuable timber-trees, are abundant. The natives of some of the islands are Alfoers; of others, Malays on the coasts, and Alfoers in the interior. In Ceram are also Papuan negroes, brought originally from Bali and Papua as slaves.

The Resident and other Dutch officials reside in the city of Amboyna, the streets of which are broad, planted with rows of beautiful trees, and cut each other at right angles. There are two Protestant churches, a town-house, orphanage, hospital, and theatre, besides a useful institution for training native teachers, with which is connected a printing-press. Near the city are beautiful promenades and country-seats. Pop. 10,500.

In 1854, the clove-produce amounted to 580,592 lbs., the number of trees planted being 405,639, of which one-third part were fruit-bearing; nutmegs, 337,861 lbs., and mace, 133,986 lbs.; the trees planted being 424,573, of which 297,272 were bearing. The total cost of the nutmegs and mace delivered in the Netherlands that year was £30,768 sterling, realising £94,466. In 1859, the M. sent to Java for the account of government, 2012 picols of mace (the picol = 133 lbs.), 81,101 of cloves, 6636 of nutmegs, and 28 of cocoa-nut soap; the value being £59,416. The produce of nutmegs, in 1851, was 463,309 lbs.; in 1859, it had risen to 832,634, and in 1860, to 1,044,657. The clove-crop varies much, as the following table will shew: 1856, 617,250 lbs.; 1857, 187,093½; 1858, 233,518; 1859, 390,888; 1860, 258,117. Amboyna and Banda have been free ports since 1854; but as government monopolises the labour, there is no fair competition, and the people are slaves of the soil, their chiefs being paid in proportion to the produce delivered.

In 1521, Antonio de Brito first appeared to take possession of the M. in the name of the king of Portugal; and after a long period of violence, intrigue, and perfidy, the Portuguese were driven out by the Dutch and natives, at the beginning of the 17th century. The change was of no advantage to the natives, for the Dutch, having obtained the exclusive right of buying all the cloves, at a nominal value, a series of wars ensued, which resulted in the subjugation of the Spice Islands. Recently, new

sultans of Ternate and Tidore have been appointed, with less power than their predecessors; and the wars with the Alfoers of Ceram, in 1859 and 1860, have brought them more fully under Dutch rule.

**MOLYBDENUM** (sym. Mo; equiv. 48; sp. grav. 8.62) is a rare metal, which, in a state of purity, is of a silvery white colour, has a strongly metallic lustre, is brittle, and very difficult of fusion. It never occurs native, and its principal ore is the bisulphide, which much resembles graphite. It is also occasionally found oxidised, in molybdate of lead. The metal may be obtained by roasting the bisulphide in a free current of air, when the sulphur goes off oxidised as sulphurous acid, and the M. is also oxidised into Molybdic Acid ( $\text{MoO}_3$ ), and remains in the vessel. By the action of charcoal, the reduced metal is then obtained from the acid.

M. forms three compounds with oxygen—the protoxide ( $\text{MoO}$ ), the binoxide ( $\text{MoO}_2$ ), and molybdic acid ( $\text{MoO}_3$ ). Of these three, the last alone has any practical value. Molybdic acid is a white, glistening, crystalline powder, which is almost insoluble in water, fuses at a red heat, and unites with bases to form well-marked salts, the molybdates, which are either colourless or yellow. A solution of molybdate of ammonia is one of the most delicate tests for phosphoric acid.

M. forms various compounds with sulphur, chlorine, &c., none of which are of any practical importance, except the native bisulphide.

**MOMENT**, of any physical agency, is its importance with reference to some special application. Thus, the moment of a force applied (perpendicularly) to a lever, is the importance of the force as regards turning the lever about its fulcrum. It is, as we know (see **LEVER**), proportional to the product of the force by the distance of its point of application from the fulcrum. The moment of a force about any axis (to which its direction is perpendicular) is the product of the force by its least distance from the axis; and a similar definition is laid down for moment of velocity and moment of momentum. It is easy to see (see **MOMENTUM**) that in any system of mutually acting bodies the moment of momentum about any axis remains constant, since the equal mutual forces measure the momentum transferred from one body to another, and the moments of these forces are in pairs equal and opposite. A particular case of this is Kepler's law, that each planet describes equal areas in equal times about the sun.

**Moment of Inertia**.—In the rotation of bodies round an axis, the moment of inertia is the sum of the products of each particle of the body into the square of its distance from the axis; or if  $M$  be the body,  $m_1, m_2, m_3$ , &c., the particles composing it, and  $r_1, r_2, r_3$ , &c., their corresponding distances from the axis, then the moment of inertia of  $M = m_1r_1^2 + m_2r_2^2 + m_3r_3^2 + \dots$ ; and if a quantity,  $k$ , be found such that  $Mk^2 = m_1r_1^2 + m_2r_2^2 + m_3r_3^2 + \dots$ , then  $k$  is called the *radius of gyration*. See **CENTRE OF GYRATION**.

**MOMENTUM**, or **QUANTITY OF MOTION**, is defined by Newton as proportional to the mass moving, and its velocity, conjointly. If we assume unit of momentum to be that of unit of mass moving with unit of velocity, we shall evidently have, for the momentum of a mass  $M$ , moving with velocity  $V$ , the expression  $MV$ . And such is the unit generally adopted.

It is shewn by experiment that, when force produces motion in any body, the momentum produced in one second is proportional to the force—and, in fact, *force is measured by the momentum it is capable of producing in unit of time*. Thus, the same force,

if acting for one second on each of a number of bodies, produces in them velocities which are *inversely* as their masses. Also when, as in the case of falling bodies, the velocities produced in one second are the same in all, we conclude that the forces are *proportional* to the masses; and, in fact, this is the physical proof that the weight of a body is proportional to its mass. Again, if different forces act, each for a second, on the *same* mass, the velocities produced are proportional to the forces. All these are but different modes of statement of the experimental fact, that force is proportional to the momentum it produces in unit of time; which forms a part of Newton's second Law of Motion.

When two masses act on each other, Newton's third Law of Motion (see MOTION, LAWS OF) shews that the forces they mutually exert are equal and opposite. The momenta produced by these must therefore be equal and opposite. Thus, in attraction or impact of two masses, *no momentum is lost*; since what is lost by one is gained by the other.

The momentum of a system of bodies can be resolved (as velocity is resolved) into components in any assigned directions, and the mutual forces of the system may be thus likewise resolved. Applying the previous result, we see at once that in any system of mutually acting bodies (such, for instance, as the solar system), no momentum is, on the whole, either gained or lost in any particular direction, it is merely transferred from one part of the system to another.

This fact, called the Conservation of Momentum, has caused great confusion in the minds of pseudo-physicists, who constantly confound it with Conservation of Work or Energy, a totally different thing.

The momentum produced by a force in any period of time is measured by the product of the force and the *time during which it has acted*—the energy or work done by a force is measured by the product of the force and the *space through which it has acted*. Momentum is proportional to the simple velocity of a body, and can never, by any known process, be transformed into anything else. Energy, when depending on velocity (see FORCE, CONSERVATION OF), is proportional to the *square* of the velocity, and is in the natural world constantly being transformed from its actual or kinetic form to its potential form, and back again, or to some other kinetic form such as heat, and finally must become heat. Momentum, on the contrary, is never altered, either in kind or in amount.

In knocking down a wall, or in staving in the whole side of a ship, the battering-ram of the ancients (when constructed of sufficient mass, and worked by the proper number of men or animals) was probably nearly as effective as the best modern artillery. But in making a breach in a wall, or in punching a hole in the armour of an iron-clad, mere massive shot with low velocities (such as those of the Dahlgren guns) are comparatively ineffective, however great their momentum; while an Armstrong or Whitworth projectile, with a fraction of the momentum, but with greater velocity, and, for its size, much greater kinetic energy, effects the object with ease.

In many every-day phenomena, we see most distinctly the difference between these two affections of matter. Thus, a blow delivered from the shoulder by a heavy pugilist, even if it be sluggishly given, generally floors its man, without doing much other injury; but a sharp stroke administered by a light weight, while hardly disturbing the adversary's equilibrium, inflicts serious punishment.

MOMMSEN, THEODOR, a distinguished writer on the history and polity of ancient Rome, was born in 1817 at Garding, in Slesvig, where his father was

a pastor in the Lutheran Church. M. studied first at Altona, and subsequently at the university of Kiel, where he graduated in arts in 1843. Having obtained some assistance from the Academy of Berlin to defray the expenses of a prolonged course of travels, M. spent three years in investigating Roman inscriptions in France and Italy, and from time to time published the result of his investigations in the *Annals of the Archaeological Institute of Rome* and the *Herculean Academy of Naples*. The political disturbances of 1848 diverted M. from his favourite pursuits; and for a time he devoted himself to politics, taking upon himself the editorship of the leading Slesvig-Holstein paper, for which he wrote the leading articles in the summer of 1848. M. held for a short time a chair in the university of Leipsic, but his appointment was cancelled on account of his strong political tendencies. He was made Titular Professor of Law at Zurich in 1852, and at Breslau in 1854; while, since 1858, he has filled the chair of Roman Law at Berlin. His attention has long been devoted to those branches of archaeology and ancient history with which his name is now so honourably associated. Among his most valuable contributions to these departments of knowledge, special mention must be made of the following: *Die Unteritalischen Dialekte* (Leip. 1850); *Corpus Inscriptionum Neapolitanarum* (Leip. 1851); his monographs on *The Chronography of the year 354* and *Roman Coins* (Leip. 1850); the edict of Diocletian, *De Pretiis Rerum Venalium* A. 301 (Leip. 1851); *Inscriptiones Regni Neapolit.-Latinae*, 1852; *Die Rechtsfrage zwischen Cæsar und d. Senat*, 1857; his great work on Roman history, *Röm. Geschichte*, 5th edition, 1868—1870 (ably translated into English by W. P. Dickson); *Römische Forschungen*, articles on special points of Roman antiquities (1st vol., Berlin, 1864); *Römisches Staatsrecht* (1st vol., Leip. 1871); *Die Erzählung von Caius Marius Coriolanus*; and his *Digesta Justiniani Augusti* (Berlin, 1868—1870).

MOMORDICA, a genus of plants of the natural order *Cucurbitaceæ*, having lateral tendrils, and the fruit splitting when ripe. *M. Balsamifera*, a native of the south of Europe and of the East, produces a curious, oblong, much-warted fruit, called the BALSAM APPLE, which, when green, is infused in oil, to form a vulnerary much esteemed in Syria and some other countries. The ripe fruit is a dangerous poison. The plant is used to form arbours.—The large, red, thorny fruit of *M. mixta*, called *Gol-kakra* in India, is there used for food.—*M. echinata* is called the *Gooseberry Gourd*, because its fruit, which is covered with bristles, is about the size and shape of a large gooseberry. The unripe fruit is used for pickling, and is sometimes to be seen in Covent Garden market.

MOMPO'X, a town of the Granadian Confederation, on the Magdalena, 110 miles south-east of Cartagena. Here the Magdalena, during its periodical floods, rises 12 or 15 feet above its usual level; and the quay and custom-house of M. are built unusually high, in order to provide against this emergency. All the foreign goods destined for the consumption of the Valley of the Magdalena pass through this town. Pop. estimated at 10,000.

MO'NACHISM (Gr. *monachos*, a monk, from *monos*, alone) may in general be described as a state of religious retirement, more or less complete, accompanied by contemplation, and by various devotional, ascetical, and penitential practices. It is, in truth, ASCETICISM (q.v.), with the element of religious solitude superadded. The institution of monachism has, under different forms, entered into several religious systems, ancient and modern. That it was

## MONACHISM.

known among the Jews before the coming of our Lord, appears from the example of the prophet Elias, and from that of the Essenians; and it is probable that religious seclusion formed part of the practice of the NAZARITES (q. v.), at least in the later periods of Jewish history. In the Brahmanical religion, it has had a prominent place; and even to the present day, the *lanaseries* of Tibet may be said to rival in number and extent the monasteries of Italy or Spain. The Christian advocates of monachism find in the gospel exhortations to voluntary poverty (Matt. xix. 21) and to celibacy (1 Cor. vii. 37), at once the justification and the origin of the primitive institution. Its first form appears in the practice of asceticism, of which we find frequent mention in the early part of the 2d century. The primitive ascetics, however, lived among the brethren, and it is only in the following century that the peculiar characteristic of monachism begins to appear. The earliest form of Christian monachism is also the most complete—that already described under the head ANCHORITES (q. v.); and is commonly believed to have in part originated in the persecutions, from which Christians were forced to retire into deserts and solitary places. The anchorites maintained from choice, after the cessation of the persecutions, the seclusion to which they had originally resorted as an expedient of security; and a later development of the same principle is found in the still more remarkable psychological phenomenon of the celebrated PILLAR-SAINTS (q. v.). After a time, however, the necessities of the religious life itself—as the attendance at public worship, the participation of the sacraments, the desire for mutual instruction and edification—led to modifications of the degree and of the nature of the solitude. First came the simplest form of common life, which sought to combine the personal seclusion of individuals with the common exercise of all the public duties; an aggregation of separate cells into the same district, called by the name *Laura*, with a common church, in which all assembled for prayer and public worship. From the union of the common life with personal solitude is derived the name *cenobite* (Gr. *koinos bios*, common life), by which this class of monks is distinguished from the strict solitaries, as the anchorites or eremites, and in which is involved, in addition to the obligations of poverty and chastity, which were vowed by the anchorites, a third obligation of obedience to a superior, which, in conjunction with the two former, has ever since been held to constitute the essence of the religious or monastic life. The first origin of the strictly cenobitical or monastic life has been detailed under the name of SAINT ANTONY (q. v.), who may be regarded as its founder in the East, either by himself or by his disciples. So rapid was its progress, that his first disciple, PACHOMIUS (q. v.), lived to find himself the superior of 7000. In the single district of Nitria, there were no fewer than 50 monasteries (Sozomen, *Eccles. History*, vi. 31), and before long, the civil authorities judged it expedient to place restrictions on their excessive multiplication. It seems to be admitted, that, in the East, where asceticism has always been held in high estimation, the example of Christian monasticism had a powerful influence in forwarding the progress of Christianity; although it is also certain that the admiration which it excited occasionally led to its natural consequence among the members, by eliciting a spirit of pride and ostentation, and by provoking, sometimes to fanatical excesses of austerity, sometimes to hypocritical simulations of rigour. The abuses which arose, even in the early stages of monachism, are deplored by the very Fathers who are most eloquent in their praises of the institution itself. These abuses prevailed chiefly in a class of monks called *Sarabaites*, who

lived in small communities of three or four, and sometimes led a wandering and irregular life. On the other hand, a most extraordinary picture is drawn by Theodoret, in his *Religious Histories*, of the rigour and mortification practised in some of the greater monasteries. The monks were commonly zealots in religion; and much of the bitterness of the religious controversies of the East was due to that unrestrained zeal; and it may be added that the opinions which led to these controversies originated for the most part among the theologians of the cloisters. Most famous among these were an order called *Acemetes* (Gr. *sleepless*), from their maintaining the public services of the church day and night without interruption. See MONOPHYTES, MONOTHEISM, NESTORIANS, IMAGE-WORSHIP.

It was in the cenobitic rather than the eremitic form that monachism was first introduced into the West, at Rome and in Northern Italy by Athanasius, in Africa by St Augustine, and afterwards in Gaul by St Martin of Tours. Here also the institute spread rapidly under the same general forms in which it is found in the Eastern Church; but considerable relaxations were gradually introduced, and it was not until the thorough reformation, and, as it may be called, religious revival effected by the celebrated St BENEDICT (q. v.), in the beginning of the 6th c., that western monachism assumed its peculiar and permanent form. In some of the more isolated churches, as, for instance, that of Britain, it would seem that the reformations of St Benedict were not introduced until a late period; and in that church, as well as in the church of Ireland, they were a subject of considerable controversy. One of the most important modifications of monachism in the West, regarded the nature of the occupation in which the monks were to be engaged during the times not directly devoted to prayer, meditation, or other spiritual exercises. In the East, manual labour formed the chief, if not the sole external occupation prescribed to the monks; it being held as a fundamental principle, that for each individual the main business of life was the sanctification of his own soul. In the West, besides the labour of the hands, mental occupation was also prescribed, not, it is true for all, but for those for whom it was especially calculated. From an early period, therefore, the monasteries of the West, and particularly those of Ireland, or of the colonies, founded by Irish monks, as Iona and Lindisfarne, became schools of learning, and training-houses for the clergy. At a later period, most monasteries possessed a *scriptorium*, or writing-room, in which the monks were employed in the transcription of MSS.; and although a great proportion of the work so done was, as might naturally be expected, in the department of sacred learning, yet it cannot be doubted that it is to the scholars of the cloister we owe the preservation of most of those among the master-pieces of classic literature which have reached our age.

In the remarkable religious movement which characterised the church of the 12th c. (see FRANCIS OF ASSISI, FRANCISCANS), the principle of monachism underwent a further modification. The *spiritual egotism*, so to speak, of the early monachism, which in some sense limited the work of the cloister to the sanctification of the individual, gave place to the more comprehensive range of spiritual duty, which, in the institute of the various bodies of FRIARS (q. v.) which that age produced, made the spiritual and even the temporal necessities of one's neighbour equally with, if not more than, one's own, the object of the work of the cloister. The progress of these various bodies, both in the 12th c. and since that age, is detailed under their several titles. It only remains to detail the later history of monachism,

properly so called. The monastic institutes of the West are almost all offshoots or modifications of the BENEDICTINES (q.v.); of these, the most remarkable are the CARTHUSIANS, CISTERCIANS, GRAND-MONTINES, CLUGNIACS, PREMONSTRATIENSIS, and above all MAURISTS, or Benedictines (q.v.) of St Maur. In more modern times, other institutes have been founded for the service of the sick, for the education of the poor, and other similar works of mercy, which are also classed under the denomination of monks. The most important of these are described under their several heads.

The enclosure within which a community of monks reside is called a MONASTERY (q.v.)—Gr. *monasterion*, Lat. *monasterium*. By the strict law of the church, called the law of cloister or enclosure, it is forbidden to all except members of the order to enter a monastery; and in almost all the orders, this prohibition is rigidly enforced as regards the admission of females to the monasteries of men. To such a length is this carried in the Greek Church, that in the celebrated enclosure of Mount Athos, not only women, but all animals of the female sex are rigorously excluded. The first condition of admission to a monastic order is the approval of the superior, after which the candidates remain for a short time as *postulants*. After this preliminary trial, they enter on what is called the *novitiate*, the length of which in different orders varies from one to three years; and at its close, they are admitted to the profession, at which the solemn vows are taken. The age for profession has varied at different times and in different orders; the Council of Trent, however, has fixed 16 as the minimum age. Originally, all monks were laymen; but after a time, the superiors, and by degrees other more meritorious members, were admitted to holy orders. The distinction of priest-monks and lay-brothers has been already explained under the head FRIAR; but in both alike, where the order is one of those solemnly approved by the church, the engagement taken at the final profession is life-long and irrevocable.

The monastic institute, from the very earliest time, embraced women as well as men. The former were called in Greek by the name *nonis* or *nonna*, and in Latin *nonna* (from which the English *nun*), as also *sanctimonialis*. The cloistered residence of nuns is called by various names, as NUNNERY, CONVENT, a name also applied to the houses of men. The general characteristics of the monastic institute for females are substantially identical with those of the male orders; and as the principal varieties of institute are detailed under their respective heads, it is needless to particularise them here.

It is hardly necessary to say that the reformed churches in the 16th c. discarded the practice of monachism, and suppressed the monastic houses. In some of the German states, the temporalities of the suppressed monasteries were retained, and were granted at pleasure by the sovereign, to be enjoyed together with the titular dignity. Some of the German churches, however, in later times, have revived the institute both for men and for women, as has also been done in the Anglican Church both in the time of Laud and in our own day. In all these Protestant revivals of monachism, however, the engagement is revocable at the will of the individual. At the French Revolution, the monastic establishments of France were utterly suppressed; and in most of the other Catholic countries of Europe, the example has been followed to a greater or less extent. In England and Ireland and America, on the contrary, the institute has made rapid progress within the last 20 years. Most of the orders, however, introduced into these countries are

of the active rather than of the contemplative class.

MO'NACO, a small principality of Italy, on the coast of the Mediterranean Sea, a few miles north-east of the city of Nice. The climate is fine, so that oranges, lemons, &c. are produced in abundance. Population (1867) 3127. From the 10th to the 18th c., M. was held by the Genoese family of Grimaldi. In 1815, it was ceded to Sardinia, which, however, recognised its independence, but reserved to itself the right of garrisoning the town of Monaco. At this period, it consisted of three communes—Monaco, Mentone, and Rocca-bruna, with an area of 52 square miles, and a population of about 7000. In 1848, Mentone and Rocca-bruna were annexed to Sardinia, in spite of a protest by his 'Serene Highness,' Carlo Honorio, third prince of Monaco. The Italian war of 1859 placed the whole territory for a brief period under Victor Emmanuel; but Carlo Honorio having sold Mentone and Rocca-bruna (2d Feb. 1861) to the French emperor for 4,000,000 francs, Sardinia was obliged to renounce her hold upon them. Carlo Honorio now possesses nothing but the city and territory of M. itself. M. is a pretty little place on a rocky promontory, with 1887 inhabitants.—Mentone, now a town of France, is a favourite winter resort for invalids.

MO'NAD (Gr. *monas*, unity), a term borrowed from the Peripatetic philosophy, although employed by moderns in a sense different from that of the Peripatetics, who used it to designate the universe, understood in the pantheistic sense. By moderns, and especially by LEIBNITZ (q.v.), from whose system alone the name has derived importance, it is used to describe the primary elements of all matter. The monads are simple uncompound substances, without figure, without extension, without divisibility, by the aggregation of which all bodies are formed, and into which all compounded things may ultimately be resolved. The monads are created things, but as being uncompound, are indestructible; and although subject to change, the change is but external or relative. They are of two classes—the first are destitute of consciousness, although possessing an internal activity which is called by the name of perception; the second possess, in addition to perception, a certain consciousness, which is called by the name 'apperception' or conscious-perception. The monads of this class are souls, and according to the degree of their consciousness is the distinction between the souls of the higher and those of the lower intelligences. The Deity is the PRIME MONAD, or MONAD OF MONADS. The theory of monads enters largely into the philosophic system of Leibnitz, and indeed furnishes the key to much in that system which is otherwise obscure.

MONAD (*monas*), the generic name of many kinds of microscopic organisms, very minute, and supposed also to be of very simple organisation. They appear, even under a powerful microscope, as mere points, moving rapidly through the fluid in which they exist, and often becoming aggregated in clusters; or they are seen to be gelatinous and globular, or nearly so, with a tail or thread-like filament, by the vibrations of which they move. When the fluid is tinted by means of some harmless colouring matter, the existence of several cells or vesicles is discerned within the minute body. Ehrenberg therefore classed them among Polygastric Infusoria (see INFUSORIA), and no naturalist doubted their right to a place, although one of the lowest, in the animal kingdom. They are now universally regarded as vegetable, and are ranked among algae. The organisms formerly known as Globe Animalcules (*Volvax*) are clusters of monads

## MONADNOCK—MONASTERY.

produced by gemmation from one, and invested with a common envelope. Monads are of various colours. Their gemmation takes place according to fixed laws, so that the groups assume particular forms, characteristic of the different kinds. Thus, in the 'Breast-plate Animalcule' (*Gonium pectorale*), so called from the form which the group frequently presents, a division takes place into four, and the number in a group is always either four or sixteen, a group of sixteen always dividing into four parts, each of which contains four monads.—The minute moving points often seen under the microscope are probably often not monads, but spores or germs.

**MONADNOCK, GRAND**, a mountain in the south-west corner of New Hampshire, United States of America, which from a base of 5 by 3 miles, rises to a height of 3450 feet. It is composed of tale, mica, and slate, can be seen from the State House at Boston, and is a landmark at sea. Thirty lakes, some containing numerous islands, can be seen from its summit.

**MONAGHAN**, an inland county of the province of Ulster, Ireland, situated between Tyrone on the N., Armagh and Louth on the E., Meath and Cavan on the S., and Fermanagh on the W. Its greatest length from north to south is 37 miles; its greatest breadth, east and west, is 28; the total area being 500 square miles, or 319,757 acres, of which 285,885 are arable. The population, which in 1861 was 126,340, had fallen in 1871 to 114,970. The general surface is undulatory, the hills, except in the north-west and east, being of small elevation, although often abrupt; the highest point does not exceed 1254 feet above the sea. It is interspersed with lakes of small extent, and for the most part of little depth, and although the streams are numerous, there is no navigable river within its boundaries. In its geological structure, the level country belongs to the great central limestone district; the rest is of the same transition formation which is met with in the northern tract of Leinster. No minerals are found in a remunerative quantity; there is a small coal-field in the southern border, but it has not been found profitable to work. The soil is very varied in its character, and for the most part is wet and imperfectly drained, although commonly capable of much improvement; but in general it is found suitable for the production of cereal crops (with the exception of wheat, which is little cultivated), and of flax. The culture of the last is steadily advancing. In 1867, there were 10,000 more acres of flax than in 1861. The total area under crops in 1867 was 149,987 acres. The cattle in the same year numbered 72,689; sheep, 21,154; pigs, 22,853. The annual valuation of property was £269,571. M. is well supplied with good roads, and is connected by railway with Dublin, Belfast, and Galway, and directly with the coast at Dundalk. The Ulster Canal passes through the county. The principal towns of this county are Monaghan (q. v.), Carrickmacross, Clones, and Castle-Blayney. It returns two members to parliament, the constituency being at the enumeration of 1873, 5608. M., at the invasion, formed part of the grant of Henry II. to De Courcey, and was partially occupied by him; but it speedily fell back into the hands of the native chiefs of the sept MacMahon, by whom (with some alternations of re-conquest) it was held till the reign of Elizabeth, when it was erected into a shire. Even still, however, the authority of the English was in many places little more than nominal, especially in the north; and in the rising of 1641, the MacMahons again resumed the territorial sovereignty. The historical antiquities of the county are of little interest or

importance. It possesses two round towers, one very complete, at Clones, the other at Inniskeen; and there are many remains of the ancient earth-works commonly referred to the ante-English period. The total number of children attending the superior and primary schools in the county of M. during 1871 was 12,749, of whom 8586 were Roman Catholics.

**MONAGHAN**, chief town of the county of the same name, is situated on the great north line from Dublin to Londonderry, distant from the former 76 miles north-north-west. Pop. in 1871, 3760. M., before the Union, was a town of some importance, having a charter from James I., and returning two members to the Irish parliament. It is still the centre of an active inland trade, and can boast some public buildings of considerable pretensions, among which are the jail, market-house, and court-house. A Roman Catholic college and a cathedral dedicated to St Mac Carthain, also deserve special notice. The general market is on Monday; 3 markets for agricultural produce are held weekly, and there is also a monthly fair.

**MONARCHY** (Gr. *monarchia*, from *monos*, alone, and *archō*, to govern; literally, the government of a single individual) is that form of government in a community by which one person exercises the sovereign authority. It is only when the king, or chief magistrate of the community, possesses the entire ruling power, that he is in the proper acceptation of the term a monarch. Most of the oriental governments past and present, Russia at present, and Spain and France as they were in the last century, are in this strict sense monarchies. The degenerate form of monarchy is tyranny, or government for the exclusive benefit of the ruler. When the head of the state, still possessing the status and dignity of royalty, shares the supreme power with a class of nobles, with a popular body, or with both, as in our own country, the government, though no longer in strictness monarchical, is called in popular language a mixed or limited monarchy, the term absolute monarchy being applied to a government properly monarchical. The highest ideal of government would perhaps be attained by an absolute monarchy, if there were any security for always possessing a thoroughly wise and good monarch; but this condition is obviously unattainable, and a bad despot has it in his power to inflict infinite evil. It therefore becomes desirable that a governing class, composed, if possible, of the wisest and most enlightened in the country, should share the supreme power with the sovereign. A limited monarchy has this advantage over an aristocratic republic, that in difficult crises of the nation's existence royalty becomes a neutral and guiding power, raised above the accidents and struggles of political life.

Monarchy, most usually hereditary, has sometimes been elective, a condition generally attended with feuds and distractions, as was the case in Poland. The elective system is still followed in the choice of the pope. Constitutional monarchy may be in its origin elective, or combine both systems, as when one family is disinherited, and the sceptre declared hereditary in the hands of another under certain conditions. See **KING, REPUBLIC**.

**MONASTERY** has been described under the head of **MONACHISM** (q. v.) as the generic name of the residence of any body of men, or even, though more rarely, of women, bound by monastic vows. It may be useful, however, to detail the various classes of monastic establishments of the Western Church, and to point out the leading characteristics of each. The name, in its most strict acceptation, is confined to the residences of monks, properly so called, or of

## MONASTIR—MONEY.

nuns of the cognate orders (as the Benedictine), and as such, it comprises two great classes, the *Abbey* and the *Priory*. The former name was given only to establishments of the highest rank, governed by an abbot, who was commonly assisted by a prior, sub-prior, and other minor functionaries. An abbey always included a church, and the English word *Minster*, although it has now lost its specific application, has its origin in the Saxon and German *Münster* (Lat. *monasterium*). A *Priory* supposed a less extensive and less numerous community. It was governed by a Prior, and was generally, although by no means uniformly, at least in later times, subject to the jurisdiction of an abbey. Many priories possessed extensive territorial domains, and of these, not a few became entirely independent. The distinction of abbey and priory is found equally among the Benedictine nuns. In the military orders, the name of *Commandery* and *Preceptory* corresponded with those of abbey and priory in the monastic orders. The establishments of the Mendicant, and, in general, of the modern orders, are sometimes, though less properly, called monasteries. Their more characteristic appellation is *Friary* or *Convent*, and they are commonly distinguished into *Professed Houses* (called also *Residences*), *Novitiates*, and *Colleges*, or *Scholastic Houses*. The names of the superiors of such houses differ in the different orders. The common name is *Rector*, but in some orders the superior is called *Guardian* (as in the Franciscan), or *Master*, *Major*, *Father Superior*, &c. The houses of females—except in the Benedictine or Cistercian orders—are called indifferently *Convent* and *Nunnery*, the head of which is styled *Mother Superior*, or *Reverend Mother*. The name *Cloister* properly means the enclosure; but it is popularly used to designate, sometimes the arcaded ambulatory which runs around the inner court of the building, sometimes, in the more general sense of the entire building, when it may be considered as synonymous with *Convent*.

**MONASTIR** (more correctly, **TOL-MENASTIR**, or **BITOLIA**), a town of European Turkey, eyalet of Rum-ili, is situated in a broad valley of the Niji Mountains, 90 miles north-north-east of Janina, and about the same distance west-north-west of Saloniki. It is an important place, is the residence of the governor-general, and commands the routes between Macedonia and Northern Albania. The inhabitants are mostly Greeks and Bulgarians. M. has 11 mosques, and carries on a large trade with Constantinople, Saloniki, Vienna, and Trieste. From Constantinople alone it annually buys goods to the value of £1,500,000. Its bazaars, containing more than 2200 shops, are well stocked with the products of Western Europe and the colonies, as also with native manufactures. Yet it is one of the worst built and most tasteless towns in all Turkey. Pop. 34,000.

**MONBODDO**, JAMES BURNET, LORD, a Scottish lawyer and author, was born at Monboddo, in Kincardineshire, in 1714, educated at Marischal College, Aberdeen, where he displayed a great fondness for the Greek philosophers, and afterwards studied law for three years at Groningen, in Holland. In 1737, he became a member of the Scottish bar, and soon obtained considerable practice; but the first thing that brought him prominently into notice was his connection with the celebrated Douglas case, in which Mr Burnet acted as counsel for Mr Douglas. In 1767, he was raised to the bench by the title of Lord Monboddo. He died 26th May 1799. M.'s first work, on the *Origin and Progress of Language* (1771—1776), is a very learned, heretical, and eccentric production; yet in the midst of its grotesque

crotchets there occasionally flashes out a wonderfully acute observation, that makes one regret the distorted and misapplied talent of the author. The notion that men have sprung from monkeys, or perhaps that which is most commonly associated with the name of M., who gravely asserted that the orang-outangs are members of the human species, and that in the Bay of Bengal there exists a nation of human creatures with tails, and that we have only worn away ours by sitting on them, but that the stumps may still be felt. M. wrote another work, entitled *Ancient Metaphysics*, which was published only a few weeks before his death.

**MONCADA**, DON FRANCISCO DE, Count of OSONA, an historian, and one of the Spanish classic, born 29th December 1586, at Valencia, where his grandfather was then viceroy. Descended from one of the greatest families of Catalonia, he rapidly rose to the highest offices in the state, was ambassador to Vienna, and latterly governor of the Netherlands, and commander-in-chief of the Spanish troops there. He distinguished himself both as a statesman and a soldier. He fell at the siege of Goch, a fortress in the duchy of Cleves, in 1635. His *Historia de la Expedicion de Catalones y Aragoneses contra Turca y Griegos* (Barcelona, 1623, and frequently reprinted), is a master-piece in liveliness and elegance of style.

**MONCALIERI**, a town of Italy in the province of Turin, situated finely on the slope of a hill, on the right bank of the Po, five miles above Turin. Pop. 9907. M. is the first railway station between Turin and Genoa, and communicates daily with Turin by frequent omnibuses; it has fine buildings, including a palace lately embellished for the residence of King Victor Emmanuel. The annual cattle-fair held in October, at M., is the most important of the north of Italy.

**MONDOVI**, an episcopal town in Cuneo, one of the northern provinces of Italy, situated on the summit and shoulder of an Alpine hill, 50 miles south of Turin. It is divided into four sections: the Piazza—encircled by walls, and containing the chief buildings of the place, and the suburbs, Carassone, Breo, and Piano del Valle. In the neighbourhood, considerable activity exists in cloth, silk, and bonnet-straw manufactures; but in spite of vineyards and chestnut woods, the numerous remains of ruined buildings in its vicinity impart an air of desolation to the locality. The Piazza contains a fine cathedral, with rich paintings; an episcopal palace, with a noble gallery of portraits; and the various judicial and educational halls. Pop. (1872) 17,300. At the battle of M., on the 22d April 1796, the Sardinians were totally defeated by Bonaparte, and the entrance into Piedmont secured to the French army. The province of M. is intersected by spurs of the Alps, and contains rich marble quarries and valuable mineral products.

**MONESIA BARK**, the bark of a tree (*Caryophyllum glycyphloeum*, or *C. Buranheim*), of the same genus with the Star Apple (q. v.), a native of the south of Brazil. The bark is lactescent; but when dried, it is thick, flat, compact, heavy, brown, and hard, with a taste at first sweet, afterwards astringent and bitter. A substance called *Monesin* is extracted from it, which is almost black, at first sweet, then astringent, and finally acrid. It is used as a stomachic and alterative in leucorrhœa, chronic diarrhœa, &c. It contains, in small quantity, a principle called *Monesin*.

**MONEY**, in Political Economy. This is a word in continual use all over the civilised world, and perhaps there is none the meaning of which is

connection with the business they have in hand is more distinctly understood by those who use it; and yet, on the other hand, there is none of which it is more difficult to give a comprehensive account or a strict definition. Presuming, then, that every one knows the practical use of the word in the affairs of common life, the best thing to be done here will be to point out a few distinctions which may tend to obviate confusion in the comprehensive use of the term as an element in economic science.

Money is often spoken of loosely as the same thing with capital; but they are different. Before anything is money, it must be such that you can go into the market and immediately use it in purchasing commodities or paying debts. The plant of a railway and the machinery of a mill, so long as they are in full use, are capital, and are capital which probably has once been money—but they are money no longer, because you cannot use them in making payments, though they have perhaps become more valuable than ever they were. The confusion of capital with money was the mistake made in issuing the French assignats on the security of the forfeited landed estates. Each assignat was a promise to pay; but when payment was demanded, it could not be made, because land was not a medium for making it. It is of the essence of money, then, that it is capable of making immediate payment either to satisfy a seller or a creditor. But an article may be money though it will not satisfy everybody; and articles available as money—even those most universally accepted as such—are available for other purposes. What we are familiar with as the most approved form of money—as the thing that will be most certainly received in payment all over the world—is coin of the precious metals. The reason why the claim of these is so universally accepted is, that they do not merely represent value, as we shall find other kinds of money do, but they really are value. If the dealer sells a hat for a sovereign, he knows that the sovereign does not depend, like a pound-note, on the solvency of the issuer, but that it has got value put into it by costing about as much labour and skill in bringing it into existence as the hat he gives for it. But even all coins perfectly available for money are not of the intrinsic value of their denomination. The silver for making 20 shillings is a good deal less valuable as a commodity than the gold in a sovereign; and in the same way, 240 pence, which are as money equal to a sovereign, only make a percentage of it in value as merchandise. The convenience of their use for small transactions makes up for depreciation in value of coins of the inferior metals, when gold is a standard; and to prevent incidental abuses, the law limits the extent to which they are a legal tender as good money.

Money transactions are distinguished from barter, in which one commodity is transferred for another, as where the shepherd, in primitive times, may be supposed to have given the agriculturist a sheep for a measure of corn. This distinction is extremely useful, since the invention of a circulating medium, which supersedes the narrow, cumbrous process of barter, by facilitating transactions of every variety of importance among all sorts of people, is a grand type of advance in civilisation. Like many other distinctions, however, it has not an absolute line of demarcation. The precious metals hold their value by their being commodities as well as being money, and coins are frequently used up for plate and jewellery. Where money is only available within one narrow region, its use verges on barter. In Central Africa, purchases are made and debts paid by strings of beads or coils of brass wire. An ivory merchant or a traveller will lay in a stock of these,

just as in Europe he would carry gold or circular-notes. They are commodities, being used as ornaments by the inhabitants. But they are distributed to an extent far beyond the demand in this shape, and that they absolutely constitute money is shewn by this peculiarity in the case of beads, that a particular colour will pass current, and another will not; so that the merchant who chooses the wrong kind, though he have full value in merchandise, has not taken with him a supply of available cash.

Under the head of BULLION, it is shewn how the precious metals are an expensive form of money, which there is a temptation to supersede by paper-money. For the various opinions adopted by different classes of economists on paper-money, and the devices for getting over the great difficulty of rendering this kind of money secure, and equal in value to bullion, reference is made to the article CURRENCY. It may here be proper to state, that paper-money, or money founded on credit—one of the resources of advanced civilisation and complicated commerce—introduces a class of moneys so extensive and various, that it is impossible to mark the limits of its extent, or enumerate the shapes it may take. An attempt has been made to get rid of all difficulties by saying that a promise to pay is only the representative of money. But if it serve the purpose of buying or paying debt, it really is money. No one hesitates in counting a £5 Bank of England note as money. But a cheque by a person known to have a balance or credit at a solvent bank, is equally money; and though it is an order to pay, no actual bullion need ever be given for it, for the payment may be in notes, or the holder may hand it over to his own banker, in whose accounts it will be credited to the holder, and debited against the banker on whom it is drawn. The special difficulty as to paper-money is, that it may be mistaken for money when it is none, as in the case of a cheque not honoured by payment; or, that it may be of less intrinsic value than it professes to be, as when there is what is called an over-issue (see CURRENCY). There are thus great risks attached to the use of paper-money; but there are also risks specially applicable to bullion-money, as light weight, base coin, and the absence of those facilities for detection in theft or fraud, which are among the advantages of paper-money. The special risks attending the use of paper have been shewn in practice to be so capable of remedy by legislative precautions, that at present, in Scotland, one-pound notes are taken with less suspicion than sovereigns. On transactions in general, the chance of loss from forgery or insolvency is deemed less than the chances from light weight, even if the risk of base coinage should not come into consideration.

Making allowance for coins sent abroad or used as metal, the money of Britain is calculated at: gold, seventy-five millions; silver and copper, thirteen millions; and notes, forty-two millions—in all, one hundred and thirty millions. But so large is the extent of paper-money, in the shape of drafts and bills, that of these payments, to the extent of more than two thousand millions in a year are settled at the London clearing-houses, or the establishments where the London banks, and those dealing with them, clear off their mutual obligations by paying over the balances.

MONGE, GASPARD, COMTE DE PÉLUSE, a French mathematician and physicist, was born of humble parentage at Beaune, in the department of Côte d'Or, 10th May 1746. When only fifteen, he went to study natural philosophy at the Oratorian College of Lyon, and afterwards obtained admission into the famous artillery school at Mézières, where

he invented the method known as 'Descriptive Geometry,' which was at first received with incredulity, but afterwards with avidity, and, for a time, jealously kept secret by the military authorities. In 1772, M. became tutor and professor at Mézières; in 1780, he was chosen a member of the French Academy; and in the same year, was called to Paris as Professor of Hydrodynamics at the Louvre. As a lecturer, he was precise, clear, and brief; his style was a model of scientific rigour, if not of literary elegance. During the heat of the Revolution, he became Minister of Marine, but after a few months resigned the office. He did not, however, retire into obscurity, but took charge of the great manufactories improvised for supplying the million of soldiers whom republican France had launched against her enemies, with arms and gunpowder. At this critical period, he shewed himself possessed of a genius equal to the occasion. He was everywhere, animating, ordering, counselling, and directing the patriotic artisans. Yet it is characteristic of the insane fanaticism that, for a time, got the upper hand in France, that M. himself only escaped the guillotine on account of his services being absolutely indispensable. After he had founded the *Ecole Polytechnique*, he was sent by the Directory to Italy, and intrusted with the transport of the artistic spoils of the republican armies. Here he formed a close friendship with Bonaparte, whom he followed to Egypt. He now undertook the management of the Egyptian Institute. During the expedition to Syria, he performed the greatest services to the government established at Alexandria. On his return to France, he resumed his functions as Professor in the *Ecole Polytechnique*, and, though his reverence for Napoleon continued unabated, he hotly opposed his aristocratic and dynastic views. The title of Comte de Péluse (Pelusium) was conferred on him by Napoleon, in memory of the Egyptian expedition. He died 28th July 1818. M.'s principal works are: *Traité Élémentaire de Statique* (7th edit. Paris, 1834); *Leçons de Géométrie Descriptive* (6th edit. Paris, 1837); and *Application de l'Analyse à la Géométrie des Surfaces du 1 et du 2 Degré* (4th edit. Paris, 1809). See Dupin's *Essai Historique sur les Services et les Travaux Scientifiques de Monge* (Paris, 1819).

**MONGHYR**, a city of India, capital of a district of the same name, is situated on the right bank of the Ganges, 30 miles west-north-west of Bhagulpur. It is a large and thriving town, and carries on extensive manufactures of hardware and firearms, which, however, are of very inferior quality. Owing to the salubrity of its climate, it is a favourite residence of invalided military men and their families. Pop. (1872) 59,698. The district has an area of 3913 square miles, with a pop. of 1,168,761. M. is on the line of the East Indian Railway.

**MONGOLS**, the name of a numerous and widely spread branch of the human family—the second in the classification of Blumenbach, and corresponding in almost every respect with the branch designated as Turanian by more recent ethnologists. See **TURIANS**. Under the designation of M. are included not only the Mongols Proper, but the Chinese and Indo-Chinese, Tibetans, Tartars of all kinds, Burmese, Siamese, Japanese, Esquimaux, Samoids, Finns, Lapps, Turks, and even Magyars. Collectively, they are the great nomadic people of the earth, as distinguished from the Aryans, Semites, and Hamites; and are the same who, in remote antiquity, founded what is called the 'Median Empire' in Lower Chaldea, an empire, according to Rawlinson, that flourished and fell between about 2458 and 2234 B. C.; that is, before Nineveh

became known as a great city. Thus early did some of these nomadic tribes, forsaking their original pastoral habits, assume the character of a nation. Another great offshoot from this stock founded an empire in China, the earliest date of which it is impossible to trace, but which certainly had reached a state of high civilisation at least 2000 years B. C. In early Greek history, they figure as Scythians, and in late Roman, as Huns, carrying terror and desolation over the civilised world. In the middle ages, they appear as Mongols, Tartars, and Turks. In the beginning of the 13th c., Genghis-Khan (q. v.), originally the chief of a small Mongol horde, conquered almost the whole of central and eastern Asia. His sons and grandsons were equally successful, and in 1240–1241, the Mongol empire extended from the sea-board of China to the frontiers of Germany and Poland, including Russia and Hungary, and the whole of Asia, with the exception of Asia Minor, Arabia, India and the Indo-Chinese states, and northern Siberia. This vast empire soon broke up into a number of independent kingdoms, from one of which, Turkestan, arose another tide of Mongol invasion under the guidance of Timur or Tamerlane, who, in the latter part of the 14th c., reduced Turkestan, Persia, Hindustan, Aris Minor, and Georgia, under his sway, and broke, for a time, the Turkish power. On the death of his son Shah Rokh, the Mongol empire was subdivided, and finally absorbed by the Persians and Usbeks, but an offshoot of Timur's family founded, in the 16th c., the great Mogul empire of Delhi. After the decline of Timur's empire, the Turkish branch maintained the glory of the race, and spread terror to the very heart of Western Europe. In the 9th c., the Magyars, a tribe of Ugrians, also of Mongol extraction, under their leader Arpad, established themselves in Hungary, where, in process of time, they became converted to Christianity, and founded a kingdom famous in European history. See **TURKS** and **HUNGARY**.

The physical characteristics of the M. in their primitive state are thus described by Dr Latham in his *Descriptive Ethnology*: 'The face of the Mongolian is broad and flat. This is because the cheek-bones stand out laterally, and the nasal bones are depressed. The cheek-bones stand out laterally. They are not merely projecting, for this they might be without giving much breadth to the face, inasmuch as they might stand forward. . . . The distance between the eyes is great, the eyes themselves being oblique, and their caruncles being concealed. The eyebrows form a low and imperfect arch, black and scanty. The iris is dark, the cornea yellow. The complexion is tawny, the stature low. The ears are large, standing out from the head; the lips thick and fleshy rather than thin, the teeth somewhat oblique in their insertion, the forehead low and flat, and the hair lank and thin.' Of course, such a description as this cannot be understood as applying to the more civilised nations of Mongol origin, such as the Turks and Magyars, especially the latter, who, in physical appearance, differ but little, if at all, from other European nations.

In religion, the M. are, for the most part, Buddhists. There are among them, however, according to the different countries in which they reside, various other religions, as Confucianism, Taoism, fire-worship, paganism of different kinds, Mahomedanism, and Christianity. The Mongol languages, which are very numerous, are described by Dr Latham as being 'aptoic and agglutinate, rarely with true amalgamate inflection.' In 1859, according to an estimate formed by Professor Dieterici, the M. of all kinds amounted in number to as many as 528,000,000, or about half of the human race.

# MONIMIACEÆ—MONITORIAL SYSTEM.

**NIMIA'CEÆ**, a natural order of exogenous, consisting of trees and shrubs, with opposite, destitute of stipules; the bark and leaves, an aromatic fragrance. The flowers are small. The perianth is somewhat globose, and at the border sometimes into more rows. The stamens are numerous, and arise from and cover the whole interior of the tube of the perianth. There are several ovaries, each with one ovule. The fruit consists of several achenia, seated within the enlarged calyx. There are 40 known species, natives chiefly of South America. A few are found in New Zealand and India. The fruit of the *BOLDU* (*Boldoa fragrans*), a small tree, a native of Chili, is eaten. A little drupe, about the size of a currant, is very fragrant when dried.

**MONITEUR**, LE, a celebrated French journal, published by the publisher, Charles Joseph Panckoucke, in May 1789, under the title of the *Gazette Nationale, ou le Moniteur Universel*. After the crisis of the 10th August 1792, its importance as a daily record of the events which occurred during the days of the Revolution, immensely increased. The emperor wished to obtain a complete view of the events of the Reign of Terror, should consult Grandville's *Gazette Nationale, ou le Moniteur Universel*, commencé le 5th Mai 1789, précédé d'une description historique contenant un Abrégé des Etats-généraux, des Assemblées des Notables, principaux Evénements qui ont amené la Révolution (1796). In 1800, it altered its form so as to divide itself into two halves, of which the first contained the *Actes du Gouvernement*, and the second imparted to the journal something of a special character. After January 1, 1811, it changed the title of *Gazette Nationale*, retaining that of *Moniteur Universel*. After the Restoration it became the government organ, which it continued to be under Louis Philippe and Napoleon III. It has since ceased to exist.

**MONITOR**, a name given to many species of reptiles, nearly allied to the true lizards, which they differ in having no teeth on the

There are several genera of both.—The *M.* or *VARAN OF THE NILE* (*M. Niloticus*) is of a rather slender form, and has a long tail. It is olive gray, mottled with black. It attains a length of five or six feet. Crocodiles' eggs form part of its food. The *TEGUEXIN* (*Teius Teguexin*) of Brazil and Guiana is of similar size. It preys on aquatic animals. Other large species are plentiful in almost all tropical countries. They are powerful animals, have strong teeth, and defend themselves vigorously if attacked. Some comparatively small species, feeding chiefly on insects, are found in dry situations. Some of the large South American species are used for food, and their flesh is said to be excellent.

**MONITORIAL SYSTEM**, or **MUTUAL INSTRUCTION**. It first occurred to Dr Bell (q. v.), when superintendent of the Orphan Hospital, Madras, in 1795, to make use of the more advanced boys in the school to instruct the younger pupils. These youthful teachers were called *Monitors*. The method was eagerly adopted by Joseph Lancaster (q. v.) who, in the first years of this century, did so much for the extension of popular education; and from him and the originator, the system was called indifferently the Madras and the Lancastrian, as well as the Monitorial or Mutual System. The monitorial system is not, as is commonly supposed, a method of teaching; it is simply a method of organising schools, and of providing the necessary teaching power. At a time when the whole question of primary education was in its infancy, the state refusing to promote it on the ground that it was dangerous to society, and the public little disposed to contribute towards its extension, it was of great importance that a system should be adopted which should recommend itself as at once effectual and economical. It was manifest that even with the most skilful arrangement of classes, a single teacher could not undertake the tuition of more than 80 or 90 pupils; while, by the judicious employment of the cleverer boys under the general direction of the master, the school might be made almost self-working, and 300 or 400 children taught where there was only one adult superintendent. The novelty and economy of this plan, and we may add also, its temporary success, gained for it a large and enthusiastic support both in Britain and in Germany. But the importance of the system as an educational agency was universally over-rated, for although it is to be admitted that, under an able and enthusiastic master, boys may be inspired to teach well all technical and rote subjects (as, for example, in the Latin and Greek classes under Dr Pillans of the Edinburgh High School), yet it is manifest that children so instructed are not in any sense of the word educated. Their monitor necessarily lacks the maturity of mind which is indispensable to the instructor, whose business it is to arouse in the child those mental operations which have taken place within himself, and so lead him to an intelligent and rational grasp of intellectual and moral and physical truths. No amount of private instruction from the master, no enthusiasm could ever enable a boy to do this, and consequently the system broke down, after having done its work by being the engine whereby a large interest was stirred up in the education of the masses, and whereby the requisites of a primary teacher were brought into view. The reaction against the system, however, was not so violent in Great Britain or in Holland and France, as in Germany. In England, the monitorial system was modified in such a way as to secure for the master the aid of the more clever boys in teaching rote subjects, in revising lessons, keeping registers, and supervising the work of those classes not directly under

Monitor (*M. Niloticus*).

Among them are some of large size, the largest of existing saurians except those of the Iguanodon tribe. The tail of the greater number is very compressed, the better to adapt them to their habits. They receive the name *M.* from a word that they give warning by a hissing sound, the approach of a crocodile or alligator. For the reason, some of the American species receive each name *Sauvage*. Those of the Old World form the family *Monitoridae*, and those of the New World the family *Teiidae* of some naturalists.

## MONK—MONKEY.

the master's tuition. In this way were afforded the means of training for the teaching profession boys who seemed fitted by natural endowment for the work. Hence the prevalent employment in this country of paid monitors and pupil-teachers (male and female), who are regularly apprenticed to school-managers and teachers, and go forward to be trained in the normal schools now so numerous.

**MONK, GEORGE**, Duke of Albemarle, was the son of Sir Thomas Monk of Potheridge, in Devonshire, and was born at his father's residence, 6th December 1608. He spent some of his earlier years in the service of Holland, returned to England when about the age of 30, and served in the king's army against the Scots in 1639, attaining the rank of lieutenant-colonel. On the breaking out of the Irish rebellion, in 1642, he was appointed colonel of Lord Leicester's troops, sent to crush it. When the civil war began, these troops were recalled, and M. was imprisoned on account of being supposed to favour the cause of the Parliament, but was soon after released. In 1644, he was defeated and taken prisoner by Fairfax, and imprisoned in the Tower, from which he was liberated, after two years, on his swearing the Covenant. Clarendon hints that he sold himself for money. He was now intrusted with the command in the north of Ireland. Cromwell had a high opinion of his military talents, and made him his lieutenant-general and commandant of artillery; and the service which he rendered at the battle of Dunbar was so great, that he was intrusted with the chief command in Scotland. In 1653, he was joined with Admiral Blake in an expedition against the Dutch, and with his division of the fleet, consisting of 100 ships, defeated Admiral Van Tromp off Nieuwpoort, and fought another battle with him off Katwijk, in which the victory was doubtful, but Van Tromp lost his life. In April 1654, Cromwell sent him to Scotland as governor, in which difficult office he conducted himself with vigour, moderation, and equity. Even the Highlands, those immemorial 'sanctuaries of plunder,' as Guizot calls them, were reduced to order. His principal residence was Dalkeith, where he spent his leisure hours in gardening, of which he was very fond. When, after Cromwell's death, he saw everything in confusion, and felt his own position perilous, he crossed the English border, 1st January 1660, with 6000 men, united his troops with those which Fairfax had collected for Charles II., and entered London unopposed, although as yet he kept his views profoundly secret. His powers of dissimulation and reticence were immense. Everybody felt that the decision lay with 'Old George,' as his soldiers used to call him; every party courted him; he was even offered the protectorate; but while he offended nobody, he declined to connect himself with any of the sectaries, and waited patiently the course of events. His own wish (though it did not proceed from any very high-minded motive) was to bring back the Stuarts; and before long, he saw that the nation in general was thoroughly with him. On the 21st of February he called together the remaining members of the parliament which had been violently driven out twelve years before, and Charles II. was presently recalled. M. was now made Duke of Albemarle, loaded with honours, and intrusted with the highest offices in the state. But he soon retired from political affairs. In 1665, when the plague ravaged London, and every one fled that could, 'Old George,' as governor of the City, bravely stuck to his post, and did what he could to allay the terror and confusion. Next year, he was employed as second in command of the fleet sent under the Duke of York

against the Dutch; and was defeated by Von Ruyter in a sea-fight off Dunkirk, but soon after gained a bloody victory over him off North Foreland. He died 3d January 1670. Guizot describes him as a 'man capable of great things, though he had no greatness of soul.' See Guizot's *Monk*, *Chute de la Republique*, Skinner's *Life of Monk*, Hallam's *Constitutional History*, and Macaulay's *History of England*.

**MONKEY** (*Simia*), a Linnæan genus of *Mammalia*, of the Linnæan order *Primates*, and of Cuvier's order *Quadrupedia*, now constituting the family *Simiada*. The word *M.* was formerly of almost, if not altogether, the same signification with *Ape*; but the name *ape* is now more generally applied to those *Simiada* which have no tail, and no cheek-pouches; the name *M.* to those which have cheek-pouches and long tails, prehensile or not prehensile; whilst the name *Baboon* (*q. v.*) is applied to creatures considerably different from both. The smaller tailless *Simiada* are, however, still not unfrequently spoken of as monkeys, and the term is also sometimes used to comprehend all the *Simiada*.

Of all animals, the *Simiada* exhibit the greatest resemblance to man, both in their general form and their anatomical structure. This is particularly the case with some of the larger apes. In none of them, however, is there a natural adaptation for the erect position so characteristic of man, which is assumed rarely, and in general only by captive individuals, as the result of training and constraint, all of the *M.* tribe preferring to walk on four rather than on two, but all of them being adapted for living chiefly among the branches of trees, or—according to the habits of a comparatively small number of species—among bushy cliffs, where they make use of the four extremities for prehension, as hands. Most of them leap from branch to branch with wonderful agility, and some also swing themselves from a branch by their long prehensile tail, till they can seize hold of another branch. The thumb, in all the four extremities, is opposable to the fingers, which are long and flexible; but there are some monkeys which want the thumb of the fore-limbs, or have it merely rudimentary, whilst the hind-limbs are always furnished with perfect hands. In attempting to walk erect, an ape necessarily treads, not on the soles, but on the sides of its feet, which are turned inwards, and the muscles of the legs do not enable it to maintain an erect position long or easily. This difficulty is increased by the way in which the head is affixed to the vertebral column, the occipital foramen being further back than in man, so that the weight of the head is thrown forward.—The face of a *M.* exhibits a grotesque resemblance to that of man; but the lower forehead, the less perfect nose, and the more projecting jaws, give it a brutal character. The dentition of monkeys is so similar to that of man, that the dental formula for very many is the same, although many others have an additional molar on each side of each jaw; but in many, the great size of the canine teeth is a marked brutal characteristic.—The digestive organs are generally very similar to those of man, but in some of the *Simiada*, more exclusively confined to vegetable food, there is a remarkable difference in a peculiar and very complicated structure of the stomach.—The food of monkeys consists chiefly of fruits, corn, and other vegetable substances; but most of them also catch and eat insects, and even birds, of the eggs of which they are also very fond. In captivity, they learn to eat and drink almost everything that is used by man, and shew a great fondness for sweet things, and for alcoholic liquors.—The skin of monkeys is

## MONKEY POTS—MONMOUTH.

generally covered in all parts with hair, but some have the face partially naked, and many have naked callosities on the buttocks.—Many have apacious cheek-pouches, in which they stow away food which they cannot consume with sufficient expedition. They are mostly gregarious, although in this there are some exceptions. Many of the species display strong attachment to their mates and to their offspring. One or two young are generally produced at a birth. They display a remarkable propensity and talent for imitation; and this, with their extreme agility, their curious prying disposition, and their love of trick or mischief, makes them very amusing, whether in a wild or a captive state. Many of the stories told of monkeys manifest also a high degree of intelligence, although it may be doubted if the intelligence of any of the species exceeds that of the dog or the elephant. Notwithstanding their resemblance to the human form, their imitative propensity, and their intelligence, none of the monkeys shew the smallest capacity for imitating the human voice; and their 'chattering' is very unlike articulate speech.

The species of this family are very numerous, but are all confined to the warm parts of the world; Australia, however, and the South Sea Islands being destitute of them. They are divided into a number of genera, some of which belong exclusively to particular portions of the world. But in this respect, the most remarkable circumstance is the difference between those of the Old World and those of America, the geographical distribution corresponding with the division of the family into two principal groups—the monkeys of the Old World (*Catarrhini* of some naturalists), to which alone the name *Simiadae* is sometimes restricted, having the nostrils separated only by a narrow septum, and the tail wanting, short, or long, but never prehensile; the monkeys of the New World (*Platyrrhini*), the family *Cebidae* of some naturalists, having the nostrils widely separated, the tail always long, and often prehensile, most of them having also the four additional molar teeth already noticed, which none of the monkeys of the Old World possess; but none of them having cheek-pouches, which many of the monkeys of the Old World have. The most interesting genera and species of M. are noticed in separate articles.

**MONKEY POTS.** See *LECYTHIDACEÆ*.

**MONK'S HOOD.** See *ACONITE*.

**MONK'S RHUBARB.** See *DOCK*.

**MONMOUTH**, a parliamentary and municipal borough and market-town of England, capital of the county of the same name, stands, amid beautiful scenery, at the confluence of the Monnow and the Wye, 21 miles west-south-west of Gloucester. Its church, dating from the 14th c., is surmounted by a beautiful spire. Of its castle, the favourite residence of John of Gaunt, and the birthplace of Henry V., the ruins only remain. Ironworks, employing a large number of workmen, are in operation. Pop. (1871) 5879. M. unites with Newport and Usk in sending a member to parliament.

**MONMOUTH**, a maritime county in the west of England, bounded on the S. by the estuary of the Severn and the Bristol Channel, and on the W. by the county of Glamorgan. Area, 368,399 acres. Pop. (1871) 195,448. The chief rivers are the Usk, the Wye on the eastern border, and the Rumney on the western border—all of which flow south into the estuary of the Severn and the Channel. The coast-line, 22 miles in length, is indented only at the mouth of the Usk, which is navigable for vessels of the largest size to Newport, the centre

of several converging lines of railway. The surface is elevated in the north and north-west (the Sugar Loaf is 1856 feet high), but the coast-districts, comprising the Wentloog and the Caldecot Levels, are low and flat, and are protected from the wash of the sea by sea-walls and earthworks. See *CHEPSTOW*. In the fertile valleys of the Usk and Wye, wheat is the principal crop; but in the less favoured localities, barley and oats chiefly are grown. Coal, limestone, and ironstone abound in the mineral district of M., in the north-west of the county. This district abounds in collieries (of which there are nearly a hundred) and ironworks.

The scenery of this county is unusually beautiful; and the remains of numerous feudal strongholds carry the mind back to the Norman period, and earlier. Indeed, in no part of England are to be found so many remains of feudal castles as in the eastern districts of this county. In one tract of 2200 acres, there were originally six castles, and there are still the remains of five. The most imposing of the secular ruins are Raglan, Caldecot, and White castles; and the chief ecclesiastical remains are the beautiful fragments of Llanthony and Tintern abbeys (q. v.).

**MONMOUTH, JAMES, DUKE OF**, natural son of Charles II., was born at Rotterdam in 1649. His mother, Lucy Walters, according to Evelyn, a 'browne, beautiful, bolde, but insipid creature,' came to England with her son in 1656, during the Commonwealth. She is said to have been treated as though she had been the king's wife, and was committed to the Tower; but was soon allowed to retire to France, where she died. Charles sought out the boy, and committed him to the care of Lord Crofts, who gave him his own name. On the Restoration, M., then 'Mr James Crofts,' came to England with the queen-dowager, and was handsomely lodged at Hampton Court and Whitehall. These honours were, in after-years, referred to by his followers as justifying their belief that he was indeed the king's legitimate son. A wealthy heiress, Anne, daughter of the Earl of Buccleuch, was selected for his wife; and before he had completed his 16th year, he was married to her, and was created Duke of Monmouth. About the year 1670, Shaftesbury put M. forward as the head of the popular party, and rival of the Duke of York (afterwards James II.). At the period of the Titus Oates' plot (1678), rumours that the 'Protestant Duke' was indeed the king's legitimate son spread far and wide. The Duke of York was compelled to quit the kingdom; and parliament brought forward a bill for excluding him from the succession, when Charles suddenly dissolved it. A document was at the same time issued by the king, solemnly declaring that he had never been married to Lucy Walters. M. was sent into Scotland, in 1679, to quell the rebellion. He defeated the Covenanters at Bothwell Bridge; but his humanity to the fleeing and wounded was so conspicuous, and his recommendations to pardon the prisoners were so urgent, as to bring upon him the violent censures of the king and Lauderdale. He thus became the idol of the English Nonconformists. The return of the Duke of York, and the exile of M., soon followed. In Holland, he allied himself to the leaders of the Nonconformist party, exiled like himself; and when he was allowed to return to London, he was received with such demonstrations of joy, that M. felt that he was the people's choice. In 1680, he made a semi-royal progress through the west of England, with the design, probably, of courting the Nonconformists, who were more numerous there than in any other part of the country, except London and Essex. In 1682, he traversed some of the northern counties.

The king and his brother were alarmed; and M. was arrested at Stafford, and bound over to keep the peace. He meekly confessed his participation in the Rye-House plot, accusing himself and others of a design to seize the king's person, and subvert his government. The king pardoned him, on his solemn promise to be a loyal subject to the Duke of York, in case the latter should survive the king. In 1684, M. fled to Antwerp, and remained abroad until the death of the king, when he resolved to embark for England. He landed (June 11, 1685) at Lyme-Regis, and issued a manifesto declaring James to be a murderer and usurper, charging him with introducing popery and arbitrary power, and asserting his own legitimacy and right by blood to be king of England. He was received with great acclamations at Taunton, where he was proclaimed as James II. At Frome, he heard the news of the defeat of Argyle, who, at the head of the Scottish exiles, had attempted to raise an insurrection in Scotland. Money and men were now abundant; but arms were wanting, and thousands went home for want of them. On the 5th July, he was persuaded, with only 2500 foot and 600 horse, to attack the king's forces, which, under the command of the Earl of Faversham, were encamped at Sedgemoor, near Bridgewater. M.'s troops were unable to cross a running stream or wide ditch which protected the camp, and were mowed down by the king's artillery. Their ammunition soon failed; and M. having set a cowardly example of flight, his troops were slaughtered like sheep. About 300 of M.'s followers fell in the battle; but 1000 were massacred in the pursuit. M. was found concealed in a ditch, and was brought to London. He made the most humiliating submissions, and obtained a personal interview with James. 'He clung,' says Macaulay, 'in agonies of supplications round the knees of the stern uncle he had wronged, and tasted a bitterness worse than that of death, the bitterness of knowing that he had humbled himself in vain.' Even his prayer for 'one day more,' that he might 'go out of the world as a Christian ought,' was brutally refused. On the 15th June, he was brought to the scaffold, and beheaded on Tower Hill; the executioner performing his office so unskilfully that five blows were struck before the head was severed. The 'Bloody Assize' afterwards commenced under Judge Jeffreys, when M.'s adherents paid a fearful penalty for their participation in his rash and ill-advised rebellion.

**MONOCHORD**, an apparatus constructed to exhibit the mathematical proportions of musical intervals. It consists of a flat board of four or eight feet long, better 16 feet, where space can be spared. The breadth of the board is according to the number of the strings, which are from two to six. The board is covered with fine white paper. A straight line is drawn from end to end below each string, and each line is accurately divided into the different proportions into which the full length of the string, as a fundamental sound, harmonically divides itself. See HARMONICS. The string is fixed at one end, and rests on a bridge; while at the other end, where it also rests on a bridge, it is stretched by a tuning-peg, or by a weight. The sounds from the strings are produced by a violin-bow. The monochord is chiefly used in illustrating acoustical experiments in the proportion of intervals and temperament.

**MONOCOTYLEDONOUS PLANTS**, plants in which the embryo has one and only one Cotyledon (q. v.). The cotyledon in these plants varies extremely in form, and is often comparatively of great size, but has always a slit, from which, as

germination takes place, the gemmule sprouts. The gemmule in elongating assumes an acuminate shape. Monocotyledonous plants are all Endogenous (q. v.); except the Dictyogens (q. v.), in which the endogenous structure is not perfectly exhibited. They are also *endorhizal* (Gr. *endon*, within, *rhiza*, a root); that is, the radicle is covered with a cellular sheath, and gives rise to fibrils similar to itself in structure. The leaves are generally sheathing at the base, and there embrace the stem; they also generally have simple parallel nerves connected by cross veins, the leaves of dictyogens alone being reticulated. The number of the parts of the flower is generally three, or a multiple of three. The floral envelopes, often splendid, as in lilies, tulips, &c.—are generally united as a Perianth (q. v.), instead of forming a distinct calyx and corolla. The principal natural orders of monocotyledonous plants are Grasses, Cyperaceæ, Palms, Orchids, Scitamineæ, Musaceæ, Liliaceæ, and Iridaceæ. The general appearance of monocotyledonous plants distinguishes them almost as perfectly as any structural characters.

Of the fossil remains of the vegetable kingdom, the smallest portion consists of monocotyledonous plants, both acotyledonous and dicotyledonous plants being much more abundant.

#### MONODON. See NARWHAL.

**MONŒCIOUS** (Gr. *monos*, one, and *oikos*, a habitation), the term used in botany to describe those plants which have the male and female parts of fructification (*stamens* and *pistils*) in different flowers, but upon the same plant. The flowers of such plants are also said to be *monœcious*. Monœcious plants form one of the classes of the *Linnæan* artificial system, but many occasional instances of monœcious species are to be found in genera belonging to other classes. Monœcious plants often have the flowers in catkins, sometimes the male flowers only; and often in spikes, the male flowers sometimes occupying the upper, and sometimes the under part of the same spike with the female flowers, and sometimes distinct spikes upon the same plant. Common examples of monœcious plants are the hop, box, birch, beech, alder, oak, and hazel.

**MONOGRAM** (Gr. *monos*, alone, and *gramma*, letter), a character composed of two or more letters of the alphabet, often interlaced with other lines, and used as a cipher or abbreviation of a name. A perfect monogram is one in which all the letters of the word are to be traced. The use of monograms began at a very early date. They are found on Greek coins, medals, and seals, and are particularly numerous on the coins of Macedonia and Sicily. Both on coins and in MSS., it was the practice to represent the names of states and cities by monograms, of which above 500 are known, but some have not been deciphered. Monograms occur on the family coins of Rome, but not on the coins of the earlier Roman emperors. Constantine placed on his coins one of the earliest of Christian monograms, which is to be traced in the recesses of the catacombs, composed of the first and second letters of *ΧΡΙΣΤΟΣ* (Christus), a monogram which also appeared on the Labarum (q. v.), and was continued on the coins of the succeeding emperors of the East down to Alexander Comnenus and Theodora Lascaris. We often find it combined with the first and last letters of the Greek alphabet (Rev. i. 8), as in Fig. 1. Another well-known monogram is that of the name of Jesus, *IHS*, from the first three letters of *ΙΗΣΟΥΣ*.

Popes, emperors, and kings of France during the middle ages were in the practice of using a monogram instead of signing their names. About 20

coins of the French kings of the Carlovingian bear their respective monograms, as also do those of Alfred and some of the other Saxon kings

Fig. 1.

England. Fig. 2 represents that of Charlemagne, perfect monogram, in which all the letters of his name can be traced.

Printers and engravers in Germany and Italy have used monograms to a large extent as a means of distinguishing their works. In these, the initial letters of their names were often interwoven with figures of a symbolical character, so as to form a rebus on the artist's name. Fig. 3 is the monogram of Albert Dürer; Fig. 4, of Ludger zum Ring. The first typographers distinguished their publications by wood-cut vignettes, whose invention is ascribed to the elder Aldus;

besides these, each made use of a monogram cipher, a series of which, well known to the typographer, fixes the identity of the ancient printers, German, Italian, and English, from the

Fig. 3. Fig. 4. Fig. 5. Fig. 6.

monument of printing down to the middle or end of the 16th century. Fig. 5 is the monogram of Andrea Turresano d'Asola, father-in-law of Aldus Manutius; Fig. 6, of Luca Antonio Giunta, a celebrated printer of Venice between 1489 and 1500;

Fig. 7, of William Caxton. For a detailed account of the monograms of early printers

others, see Brulliot, *Dictionnaire des Monogrammes* (Munich, 1832-1834); Horne's *Introduction to Bibliography*, vol. ii.; and Herbert's and Ames's *Graphical Antiquities*.

**MONOGRAPH**, a work in which a particular subject in any science is treated by itself, and forms the whole subject of the work. Monographs are chiefly of recent date, and have contributed much to the progress of science. In botany especially, monographs of orders and genera are very numerous; some of them are among the most splendid and valuable of scientific works.

**MONOLITH**, a monument, column, obelisk, or other structure formed of a single stone. In Asia, there are examples of monolithic temples, the whole being cut out of the solid rock.

**MONOMANIA** has loosely been made to represent every form of partial insanity; but has been more rigidly defined as that mental condition in which a single faculty, or class of faculties or associations, become diseased, the mind generally remaining healthy. Slight and solitary aberrations, such as where a savage antipathy to cats coexists with a love for human kind; where there appears to be an uncontrollable tendency to steal, to squander, to drink, to destroy, are of common occurrence, and are supposed to be compatible with the exercise of intelligence, and with the discharge of many of the ordinary duties of life. By a more strict limitation, the term has been confined to such affections as involve the emotions and propensities alone. It is, however, held that, notwithstanding its apparent integrity, the whole mind is involved or influenced by the presence of such morbid conditions, at least while they are predominant. It is undoubtedly difficult to point out in what manner the belief, e. g., that a particular organ has been transmuted into glass, can interfere with or render the memory, or the power of instituting comparisons, defective and untrustworthy; yet it is legitimate to receive with caution every manifestation of powers so constituted that they fail to detect the incongruities and absurdities with which they are associated; or, having detected the real character of these errors, are unable or unwilling to cast them out, or to disregard them. There is much countenance given to this theory by facts which indicate that even trivial forms of mental obliquity are connected with an unsound organisation; and that particular and rarely recognised monomanias are invariably associated with the same structural alteration. The unhealthy elevation of the sentiment of cautiousness, for example, especially where it amounts to fear of death, panic, or panphobia, is a symptom of disease of the heart and large blood-vessels; while the monomania of ambition, or optimism, as it has been styled, is the concomitant of the general paralysis of the insane. It will be obvious, from the definitions previously introduced, that the species or varieties of monomania must correspond to the faculties or phases of the human mind, and to their combinations. Several great divisions, however, have been signalised, both on account of their frequency and of their influence upon the individual and upon society. 1. Monomania of Suspicion, comprehending doubts in the fidelity and honesty of friends and those around, belief in plots and conspiracies, the dread of poison; and where, as is often the case, it is conjoined with cunning, the propensity to conceal, mystify, and deceive. This malady has frequently been observed in intimate connection with cancer and malignant growths. 2. Monomania of Superstition and Unseen Agencies, where credulity, mingled with religious awe, peoples the external world with spectres, omens, mysteries, magnetism; and the imagination with horrors or ecstatic reveries. Insensibility to pain, or indifference to external injuries, has been observed as a characteristic of individuals affected with this disease. 3. Monomania of Vanity, or Euphoria, where display and ostentation are indulged, without reference to the position and means of the patient. 4. Monomania of Fear. 5. Monomania of Pride and Ambition. 6. Kleptomania (q. v.). 7. Dipsomania (q. v.). If it can be proved that such morbid tendencies, as have been here mentioned, and others still less prominent, are merely salient points of a great breadth and depth of mental disease, the plea of insanity may justifiably be employed more frequently in the consideration of criminal acts.—Esquirol, *La Monomanie*; Bayle, *Maladies du Cerveau*; Stephens's *Criminal Law of England*, p. 92.

## MONONGAHELA—MONOPOLY.

**MONONGAHE'LA**, a river which rises in the Alleghany Mountains in Virginia, United States of America, and flowing north into Pennsylvania, unites with the Alleghany at Pittsburg to form the Ohio. Its whole length is 300 miles. It is navigable for steam-boats to Brownsville, 60 miles, with dams and locks for low water. Vast seams of coal open in its high banks, from which flat boats are loaded, and floated down with the current through the Ohio and Mississippi.

**MONOPE'TRAL**, a temple formed of an open circle of columns carrying a roof, and without a cell.

**MONOPHYSITES**, the name given to a widely ramified sect of Christians who hold that Christ has only *one* nature (Gr. *monos*, one; *physis*, nature), a human nature become divine. Monophysite views were first decidedly put forward in the controversy against Nestorius. Cyril having expressed the opinion that the flesh of the Logos was essential to his personality, the archimandrite Eutyches (q. v.) went on to assert a deification or apotheosis of the flesh of Christ, and obtained the consent of a synod at Ephesus, in 449, commonly called the 'Synod of Robbers,' to this doctrine; but he and his adherents (at first called after him **EUTYCHIANS**) were condemned as heretics by the Council of Chalcedon in 451. It was after this council that the name *Monophysites* began to be used. The decision of the council, however—viz., that in Christ *two* natures, neither interfused, changed, nor divided, were united in *one* person, and constituted *one* hypostasis—was not calculated to allay, but rather to increase discord. Accordingly, the strife grew hotter. The Asiatic and Egyptian clergy, strongly opposed to Nestorianism, were generally inclined to Monophysite views, and received countenance from the Emperor Basiliscus. After long, and often bloody contests between the supporters of the opposite opinions, the M. formally separated from the orthodox church. This separation took place in the first half of the 6th c., when the imperial protection hitherto bestowed upon them was lost by the alliance of the emperors Justin and Justinian with the Latin Church. Besides, they had not maintained unity among themselves. As early as 482, when the Emperor Zeno published his famous *Henoticon*, or formula of concord, it was accepted by several of the more moderate Monophysites. This roused the indignation of the extremest sectaries; they renounced fellowship with their laxer brethren, and formed a sect of their own. They were called *Akephaloi*, and formed the *ultras* among the Monophysites. Controversies arose also in 519 on the question, whether or not the body of Christ was corruptible. The Severians—adherents of Severus, a deposed bishop of Antioch—affirmed that it was; the Julianists, or Gajanites, followers of Bishop Julianus or Gajanus, denied it. The former were consequently called (Gr.) *Phthartolatrists*, (Lat.) *Corrupticolæ* (Worshippers of the corrupt); the latter, *Aphthartodocetæ* (Believers or Teachers of Incorruption), and sometimes—as an incorruptible body could only be apparent, and not real—*Phantasiasts*. The *Aphthartodocetæ* split again on this other point—whether or not Christ's body was created; the *Aktistetoï* (Gr. *ktizo*, to create) asserting that it was not created, and the *Ktistolatrists*, that it was. The Severians, called also, after one of their bishops, *Theodosians*, finally got the upper hand, and excommunicated their opponents, including another sect, the *Agnoetoï*, who denied that Christ as a man was omniscient. About 560, the Monophysite Askunages, and after him the Christian philosopher Philoponus, ventured to speak of the Three Persons in the Godhead as Three Gods. This,

however, was reckoned heretical even by the M. themselves, and was the occasion of a large recession to the bosom of the Catholic Church. Monophysite communities continued strongest in Egypt, Syria, and Mesopotamia, where they maintained a regular ecclesiastical order under their own patriarchs of Alexandria and Antioch; and after the Syrian, Jakob Baradaeus (Al-Baradaï, died about 578), had drawn up for them an ecclesiastical constitution, they formed the independent churches of the *Jacobites* (q. v.) and *Armenians*. See **ARMENIAN CHURCH**. The Coptic and Abyssinian churches are also Monophysite in doctrine.

**MONO'POLI**, a town of the Italian province Terra di Bari, situated on the Adriatic shore, in a pleasant and healthy plain, 28 miles east-south-east of Bari. Pop. 20,011. It is supposed to be of Grecian origin, the name in Greek signifying *the solitary city*. It is surrounded by walls, and has a fortress constructed in 1552 by Charles V. The neighbouring territory yields an immense quantity of olive oil.

**MONO'POLY**, from the Greek, signifies *sole selling* or individual selling, and has always been used to express a limitation to one or more persons of the right or power to conduct business as a trader. It is generally used in a bad sense to express something injurious, but economic science has lately very much narrowed the field over which its injurious character is supposed to extend. In the first place, it must be created by force; if it come in the natural course of trade, it is generally beneficial. Thus, to a village where three or four traders have conducted a small lazy business, drawing large profits, there comes a capitalist, who sets up a large concern on the ready-money system, and, by selling good articles at a low rate, absorbs all the business. He is of course abused as a monopolist by the ineffective persons he has superseded; but his presence is a blessing to the community generally. If, however, he had gone to the village, not to compete with others, but with a royal patent in his pocket securing to him the exclusive trade of the village, as he could sell at his own price, and make a fortune without trouble, he would of course be, like the old royal monopolists, a calamity to the people.

A careful distinction must be preserved between monopoly and property—that is to say, an exclusive right to *trade* must be separated from an exclusive right to *possess*—for, while the law of property exists, possession will always be exclusive. If, then, a trade can only be conducted with large capital, it must fall to those who either singly, or by co-operation, can command that capital; and the answer to all complaints on the part of others is, that since capitalists can best serve the public, it is best for the public that capitalists should be allowed to do so. The old corn-laws and landed property conjoined to produce one of the best illustrations of the distinction. The power of producing grain within Britain has always been of necessity limited to those who have, either as owners or tenants, the command of the land. Forfeit all the land in the country to-morrow, and proclaim the production of grain to be free, the result would only be a change of ownership; for those who by their good-luck, or more probably by their power, got hold of rich old wheat-lands, would produce their grain much cheaper than those who got the poor lands, and, selling the produce at the same price, would pocket the difference, which would, in fact, just be not gained by them as the new landlords. But when dealers offered the people grain from abroad, and the corn-laws rendered it impossible to sell that grain in this country, then there was a monopoly in favour of the home-producer, having the effect of

## MONOSTOMA—MONOTREMATA.

by raising prices, and otherwise disturbing

of legislation was wasted by our ancestors' attempts to prohibit people from creating monopolies by that fair competition which is now the true healthy development of trade. The repeal of them and of their repeal will be the article ENROSSING. When British commerce was increasing in the 16th c., it found some old law alleged to be inherent in the royal prerogative of conferring exclusive trading rights, which was such oppression and loss. In Queen Elizabeth's parliament of 1597, a complaint was made of the benefit of favoured courtiers, oppressive monopolies had been granted, not only for the sale of luxuries, but for salt, leather, coal, and articles of ordinary consumption. Queen Elizabeth said she 'hoped her dutiful and loving subjects would not take away her prerogative, the choicest flower in her garden, and the crown and head pearl in her crown and diadem.' The subject returned to the charge, however, in 1601, on the reading over of the list of monopolies, a theatrical scene occurred by a member of parliament: 'Is not bread among the number?' this producing a sensation, continuing: 'no remedy is found, bread will be there at the next parliament.' In 1621, parliament proceedings against Sir Giles Mompesson, with an oppressive use of his patent's monopoly. Four years afterwards, an act was passed limiting this power in the crown. It leaves the right to grant a limited monopoly in the future of his invention to any inventor, and the origin of the present patent law. See

**MONOSTOMA**, a genus of Trematoid worms, some having only a single sucker, which is anteriorly, and surrounds the mouth. It belongs to the *Trematoda Digenea* (of Van Beneden), which present the phenomena of alternation of generations, the earlier or larval forms occurring in molluscs, while the perfect worms are for the most part, in vertebrate animals. The species of this genus occur *M. flavum*, in waterfowl (the larva being the *Cercaria*), which is common in *Planorbis*, &c.), *M. lentis*, found in various birds, and *M. lentis*. The red species derives its specific name from having been found by Von Nordmann in a lens in a case of cataract. Cobbold and distinguished helminthologists are inclined to think that this is not an independent species, but identical with the *Distoma ophthalmobium* (g.).

**MONOTHEISM**, the term usually employed to denote belief in the numerical unity (*unus numero*) of God, or belief in and worship of one God, as the opposite of *Polytheism* (q.v.). See the 'doctrine of the Trinity' is thought by some to be incompatible with the monotheism taught by Christ, and is therefore rejected as no part of religion. See UNITARIANS. Mohammedans hold the doctrine of the 'unity of God,' and are rigorously in some respects than modern Christians, at least they reject with vehemence the approach to a Trinitarian conception of the Deity. The rest of mankind are polytheists.

**MONOTHEISM** (Gr. *monos*, single, and *theos*, will), a modification of Eutychianism (q.v.), was introduced after the condemnation of this doctrine by the Council of Chalcedon. It contained the maintaining that, although Christ had two natures, yet these natures possessed or acted by but one will, the human will being merged in the

divine, or absorbed by it. The author, or at least the most active propagandist of this doctrine, was Sergius, Patriarch of Constantinople, who obtained for it the support of the Emperor Heraclius; and its progress was materially forwarded by the silence which, at the instance of Sergius, and under his representations, the pope, Honorius (q.v.), was induced to maintain regarding the question. The doctrine was formally condemned in the sixth general council held at Constantinople in the year 680, with which condemnation it is commonly said that the early controversies on the incarnation were brought to a close.

**MONOTREMATA** (Gr. *monos*, single, *trēma*, an opening), the lowest order of mammalia, in many of their characteristic points indicate an approximation to birds. The skull is smooth; the brain-case very small as compared to the face; the snout much prolonged, and the jaws unprovided with soft movable lips, and not furnished with teeth. (In the *Ornithorhynchus*, there are two horny plates in each half-jaw, which act as teeth, while in the *Echidna* even these substitutes for teeth are wanting.) The cranial bones coalesce, as a bird's, at a very early period, and leave no signs of sutures. The external ear is altogether absent; while the eyes, though small, are perfectly developed.

The bones of the shoulder, forming the scapular arch, are unlike those of any other mammals, and in some respects resemble those of birds, and in other respects those of reptiles. At the top of the sternum is a T-shaped bone, formed by the union of the two clavicles, corresponding to the *furculum* in the bird's skeleton. The coracoid bones, which in other mammals are mere processes of the scapula, are here extremely large, and assist, as in birds, in

Monotremata:

The breast-bone and collar-bone of the *Echidna*.

(From Milne Edward's *Zoology*.)

*a*, acromioclavicular joint; *d*, bone corresponding to the usual collar-bones of mammals; *h*, cavity for the articulation of the head of the humerus; *e*, the prolongation of the scapula to the sternum; *co*, the coracoid bone; *s*, the sternum; *c*, ribs.

strengthening the scapular arch; while the scapulae themselves are produced beyond the socket of the humerus (the glenoid cavity), so as to articulate with the sternum.

The pelvis is provided with marsupial bones, although these animals do not possess a pouch.

The feet have five toes, armed with long nails; in addition to which, the hind-feet of the males are provided with a perforated spur-like weapon, which is connected with a gland. The Australian aborigines believe the wounds made by this spur to be poisonous; but there is no scientific evidence of the fact.

The ovaries are analogous to those of birds, the

# MONOTROPACEÆ—MONROE.

right ovary being comparatively undeveloped, while the left forms a racemiform mass. The orifices of the urinary canals, the intestinal canal, and the generative canal, open, as in birds, into a common cloaca, from which circumstance the order *monotremata* derives its name. The mammary glands, of which there is only one on each side, are not provided with nipples, but open by simple slits on each side of the abdomen.

This order includes only two or three species, all natives of Australia or Van Diemen's Land, which, however, form two families—the *Ornithorhynchidae* (see DUCK-BILL), and the *Echidnidae* (see ECHIDNA).

No fossil remains of any animals of this order have as yet been discovered.

**MONOTROPACEÆ**, a small natural order of exogenous plants, allied to *Ericaceæ* and *Pyrolaceæ*; but remarkably differing from both in their habit. They are herbaceous plants with scales instead of leaves, and grow parasitically on the roots of pines and other trees, in the northern parts of the world. The only British species is *Monotropa hypopitys*, sometimes called *Yellow Bird's Nest*. The whole plant has a pleasant smell.

**MONREALÉ**, a city of the island of Sicily, province of Palermo, and 5 miles south-west of the city of that name, on the flank of a steep hill. Pop. 15,561. It has a cathedral, a palace, several conventual establishments, and possesses a healthy climate. Its chief source of wealth is its export trade in oil, corn, and fruit, almonds being one of its most important products.

**MONRO, ALEXANDER**, an eminent anatomist, and founder of the medical school of Edinburgh, styled *primus* to distinguish him from his son and successor, was born at London, September 8, 1697. His grandfather, Sir Alexander Monro of Bearnrofts, a colonel in the army of Charles II. at the battle of Worcester in 1651, was afterwards an advocate at the Scottish bar; and his father, John Monro, for some years a surgeon in the army of King William, in Flanders, on leaving it, entered into practice in Edinburgh. Alexander studied at London under Cheselden, at Paris under Bouquet, and at Leyden under Boerhaave, and in 1719 passed as a surgeon at Edinburgh. In January 1720, he was elected by the town-council first Professor of Anatomy in the university. Of the establishment and building of the Royal Infirmary of Edinburgh, he was one of the two principal promoters, and after it was opened, he delivered clinical lectures there for the benefit of the students. In January 1756, he received the degree of M.D., and in March following was elected a Fellow of the Royal College of Physicians of Edinburgh. In 1759, he resigned the anatomical chair to his youngest son, the subject of the following notice, but continued his clinical lectures at the Infirmary. His principal works are—*Osteology, or Treatise on the Anatomy of the Bones* (Edin. 1726, 8vo); *Essay on Comparative Anatomy* (Lond. 1744, 8vo); *Observations, Anatomical and Physiological* (Edin. 1758, 8vo); and an *Account of the Success of Inoculation of Small-pox in Scotland* (Edin. 1765, 8vo). He was secretary of a Society at Edinburgh, which published six volumes of *Medical Essays and Observations*, many of them contributed by himself. Two more volumes of *Essays, Physical and Literary*, were subsequently issued by the same Society, under the name of the Philosophical Society. Dr M. died July 10, 1767. He was a Fellow of the Royal Society of London, and a member of the Royal Academy of Surgery of Paris.

**MONRO, ALEXANDER, secundus**, an eminent physician and medical professor, youngest son of

the preceding, was born at Edinburgh, March 24, 1733. He studied at the university of that city; and in October 1755, obtained the degree of M.D. In July following, he was appointed joint Professor of Anatomy and Surgery with his father in the university of Edinburgh. He attended for some time the anatomical lectures of Professor Meckel at the university of Berlin. He also visited Leyden. Admitted a licentiate of the Edinburgh Royal College of Physicians, 1758, he was elected a Fellow, 1759, and was afterwards president. On the resignation of his father in the latter year, he became full Professor of Anatomy, and also succeeded him as Secretary of the Philosophical Society, which in 1783 was incorporated by royal charter, and took the name of the Royal Society of Edinburgh. In 1757, he published at Berlin a short treatise, *De Venis Lymphaticis Valvulis*, in support of the theory, that the valvular lymphatics over the whole of the animal body are one general system of absorbents; which led to a controversy with Dr William Hunter of London. Among his other works are—*On the Structure and Functions of the Nervous System*, a large illustrated folio volume (Edin. 1783); *On the Structure and Physiology of Fishes*, also an illustrated folio volume (Edin. 1785); *Description of all the Bursæ Mucosæ of the Human Body* (Edin. 1788); and *Three Treatises on the Brain, the Eye, and the Ear*, illustrated by plates (Edin. 1797, 4to). He was a member of the Royal Academies of Paris, Madrid, Berlin, Moscow, and other learned institutions, and one of the first Fellows of the Royal Society of Edinburgh, to whose *Transactions* he contributed various papers. In 1798, his son, Dr Alexander Monro, *tertius*, was conjoined with him in the professorship; and in 1808 he finally retired from the anatomical chair, and from his extensive practice. He died October 2, 1817, in his 84th year.

**MONRO, ALEXANDER, tertius**, anatomical professor, son of Dr Alexander Monro, *secundus*, born at Edinburgh, November 5, 1773, was educated at the High School and university of that city, and studied medicine, anatomy, and surgery in London. In 1798, he became joint Professor of Anatomy with his father, and the following year he took his degree of M.D. In 1803, he instituted the class of Practical Anatomy in the university of Edinburgh; and in 1808 he succeeded his father in the anatomical chair. In 1823, he was President of the Royal College of Physicians of Edinburgh; and he contributed many valuable papers to its *Transactions*. He was also a Fellow of the Royal Society of Edinburgh. He retired from his chair in 1847, with the title of Emeritus Professor of Anatomy; and thus ended the connection between the college of Edinburgh and the family of Monro, which lasted for more than a century and a quarter. He died at his seat of Craiglockart, near Edinburgh, March 10, 1859. He was the author of *Observations on Crural Hernia*, plates (Edin. 1803); *The Medical Anatomy of the Gullet, Stomach, and Intestines*, plates (Edin. 1811); *Outlines of the Anatomy of the Human Body* (4 vols. 8vo, Edin. 1813); and other professional works.

**MONROE**, a city of Michigan, United States of America, is situated on the river Raisin, 2 miles from Lake Erie, and 40 miles south-west of Detroit. It is the eastern terminus of the Michigan Southern Railway. It has a large court-house, 10 churches, woollen manufactures, flour-mills, &c. Pop. (1870) 5086. M. was settled by the French in 1774.

**MONROE, JAMES**, fifth president of the United States of America, was born in Westmoreland County, Virginia, April 28, 1758. He was descended

## MONS—MONSOON.

from a Captain Monroe of the army of Charles I., who emigrated, with other Cavaliers, to Virginia. James entered the revolutionary army at the age of 18, a cadet, and was present at several battles; but having lost his rank in the army by serving as aide-camp, he commenced to study law with Jefferson. In 1782, he was elected to the Assembly of Virginia, and at the age of 23, to the Executive Council. Next year he was elected to Congress, where he took an active part in the movements for framing a new constitution. He joined with Patrick Henry and other leading States' Rights men in opposing the ratification. He feared the power and encroachment of the Federal government. He was afterwards sent by Washington as minister to France, and was received with singular enthusiasm by the revolutionary government. He was, however, soon recalled, for having too decided French sympathies. In 1793, he was elected governor of Virginia; and in 1803 sent by Jefferson as minister to France, to purchase Louisiana, which vast territory he secured for 15,000,000 dollars. He was now employed for several years in diplomacy in England and Spain. On the election of Mr Madison to the presidency, he was made Secretary of State, and also performed the duties of Secretary of War. In 1816, his eminent services were rewarded by his being elected President of the United States by the Democratic Republican party, and he made himself very popular. The acquisition of Florida from Spain, and the settlement of the vexed question respecting the extension of slavery by the Missouri Compromise, by which, after the reception of Missouri as a slave state, the institution was prohibited above the line of latitude 36° 30', helped to secure his re-election in 1820. His most popular acts, perhaps, were the recognition of the independence of Mexico and the South American republics, and the promulgation of what has since been called the 'Monroe Doctrine,' in which he declared the American policy of 'neither entangling ourselves in the broils of Europe, nor suffering the powers of the Old World to interfere with the affairs of the New,' and that 'any attempt to extend their system to any portion of this hemisphere, would be dangerous to our peace and safety.' In 1825, he retired to his seat at Oak Hill, Loudoun County, Virginia; but he still continued in the public service. After being twice president, he acted as justice of the peace, a visitor of the university of Virginia, and member of a State Convention; but a profuse generosity and hospitality caused him to be overwhelmed with debt, and he found refuge with his relations in New York, where he died in 1831—like his predecessors, Adams and Jefferson, on the 4th of July. He was an honourable and able statesman, though not a speaker or a man of brilliant talents.

**MONS** (Flem. *Berghen*), an important town of Belgium (formerly fortified), capital of the province of Hainault, on the Trouille, 35 miles south-west of Brussels. Its fortifications were renewed and strengthened since 1818, but in 1866, in accordance with the new arrangement for the defence of the country, they were demolished. The immediate vicinity can be laid under water by altering the course of the Trouille. The *Canal de Condé* connects the town with the Scheldt, and there is communication by railway with Brussels, Valenciennes, Charleroi, &c. Its principal architectural ornament is the cathedral of St Waudru, dating from the 15th and 16th centuries—a masterpiece of Gothic. The chief manufactures are woollen and cotton goods, pottery, small-ware, and sugar-refining. The vicinity forms an extensive coal-field, with about 80 pits. A large trade is carried on in coals, flax, hemp, horses, and cattle. Pop. 27,331.

M., supposed to occupy the site of a Roman station, was made the capital of Hainault by Charlemagne in 804. During the 17th and 18th centuries, it was frequently the object of contest between France and Austria.

**MONSOON** (Malayan, *Musim*) is derived from the Arabic word *Mausim*, a set time or season of the year, and is applied to those winds prevailing in the Indian Ocean which blow from the south-west from April to October, and from the opposite direction, or north-east, from October to April. The existence of these winds was made known to the Greeks during the Indian expeditions of Alexander, and by this knowledge, Hippalus was emboldened to sail across the open sea to Muzeris, the emporium of Malabar. The monsoons depend, in common with all winds whether regular or irregular, on the inequality of heat at different places and the earth's rotation on its axis; but more particularly they are occasioned by the same circumstances which produce the trade-winds and the land and sea breezes, being, in fact, the combined effect of these two sets of causes.

If the equatorial regions of the earth were entirely covered with water, the trade-winds (see **TRADE-WINDS**) would blow constantly from the north-east in the north, and from the south-east in the south of the torrid zone, with a belt of variable winds and calms interposed; the whole system, following the sun's course, moving northward from December to June, and southward from June to December. But, especially in the eastern hemisphere, large tracts of land stretch into the tropics, and give rise to the extensive atmospheric disturbances for which those parts of the earth are so remarkable. During the summer half of the year, the north of Africa and the south of Asia are heated to a higher degree than the Indian Ocean, while Australia and South Africa are much colder. As the heated air of Southern Asia expands and rises, and the colder air from the south flows in to supply its place, a general movement of the atmosphere of the Indian Ocean sets in towards the north, thus giving a southerly direction to the wind; but as the air comes from those parts of the globe which revolve quicker to those which revolve more slowly, an easterly direction will be communicated to the wind; and the combination of these two directions results in the south-west monsoon, which prevails there in summer. Since, during winter, South Asia is colder than the Indian Ocean, which, again, in its turn, is colder than South Africa, a general motion of the atmosphere sets in towards the south and west. As this is in the same direction as the ordinary trade-wind, the effect in winter is not to change the direction, but only to increase the velocity of the trade-wind. Thus, while south of the equator, owing to the absence of sufficiently large tracts of land, the south-east trade-winds prevail throughout the year; on the north of the equator we find the south-west monsoon in summer, and the north-east in winter; it being only in summer and north of the equator that great changes are effected in the direction of the trade-wind.

Similar, though less strongly-marked monsoons prevail off the coasts of Upper Guinea in Africa, and Mexico in America. The east and west direction of the shores of these countries, or the large heated surfaces to the north of the seas which wash their coasts, produce, precisely as in the case of South Asia, a south-west monsoon in summer. As might have been expected, the monsoon off the coast of Mozambique is easterly, and that off the coast of West Australia north-westerly. The trade-winds also suffer considerable change in their

## MONSTRANCE—MONSTROSITY.

direction on the coasts of Brazil, Peru, Lower Guinea, &c. These, though sometimes considered monsoons, are not truly such, for they do not change their directions periodically, so as to be opposite to each other, like true monsoons, but only veer through a few points of the compass. For a fuller account of these partial deflections, see **TRADE-WINDS**.

In April, the north-east monsoon changes into the south-west; and in October, the south-west into the north-east. These times depending on the course of the sun, and consequently varying with the latitude, are called the breaking up of the monsoons, and are generally accompanied by variable winds, by intervals of calm, and by furious tempests and hurricanes.

Monsoons, when compared with the trade-winds, will be found to play a most beneficial and important part in the economy of the globe. Their greater velocity, and the periodical changes which take place in their direction, secure increased facility of commercial intercourse between different countries. But the full benefits following in their train are not seen unless they be considered in their relation to the rainfall of Southern Asia. Indeed, the fertility of the greater part of this fine region is entirely due to the monsoons; for if the north-east trade-wind had prevailed there throughout the year, Central and Western India, and many other places, would only have been scorched and barren saharas. The rainfall of India depends entirely on the monsoons. The coast of Malabar has its rainy season during the south-west monsoon, which brings thither the vapours of the ocean. On the Coromandel coast, on the other hand, it is the north-east monsoon which brings the rain from the Bay of Bengal. The two coasts of Hindustan have therefore their seasons reversed, the dry season of the one corresponding with the wet season of the other.

**MONSTRANCE** (Lat. *monstrare*, to shew), called also **OSTENSORY**, the sacred utensil employed in the Roman Catholic Church for the purpose of presenting the consecrated host for the adoration of the people, as well while it is carried in procession, as when it is exposed upon the altar on occasions of special solemnity and prayer. The use of the monstrance probably dates from the establishment of the festival of Corpus Christi in the 13th century. It consists of two parts, the foot or stand upon which it rests, and the repository or case in which the host is exhibited. The latter contains a small semi-circular holder called the *lunula*, or crescent, in which the host is fixed; and it appears

Monstrance.

anciently to have been of a cylindrical or tower-shaped form, in the central portion of which, consisting of a glass or crystal cylinder, the host was placed. At present, it is more commonly in the form of a star or sun with rays, the central portion of which is of glass or crystal, and serves to permit the host to be seen. This portion, or at least the crescent, is of gold or of silver gilt; the rest is generally either of the precious metals, or at least gilt or silvered, although the lower portion is occasionally of bronze artistically wrought. In many cases, it is of most costly materials and

workmanship. The monstrance, like the other vessels used in the Eucharistic service, is consecrated by a bishop, or a priest delegated by a bishop. By a peculiar usage of the city of Lucerne, in Switzerland, the Eucharist is always carried in the monstrance, when being borne to the sick.

**MONSTROSITY**, in Anatomy. When an infant, or the young of any animal, comes into the world impressed with morbid changes, which occur only in foetal life, and of which it has never been observed that they have originated in the same way after birth, such an infant or young animal is said to be a monster or monstrosity. Monsters were formerly regarded as prodigies of nature; and in the dark ages, their occurrence in the human species was usually ascribed to the intercourse of demons and witches. It is now perfectly understood that the formation of those apparently anomalous beings may be accounted for by the same laws as those which govern the formation of perfect individuals—the only difference being, that these laws in the case of monstrosity are more or less arrested or otherwise perverted.

Amongst the principal causes of monstrosity may be mentioned: 1. Something deficient or abnormal in the generative matter of one or both parents, because, as has been shewn in the article **HEREDITARY**, malformations are frequently transmitted from parents to the children. Here the morbid change is impressed upon the fetus at the moment of impregnation. 2. Some morbid condition of the maternal organs or constitution may exercise a disturbing influence upon development. 3. Diseases and abnormal states of the placenta, of the membranes of the ovum, and of the umbilical cord, may induce an arrest of development; for example, it may be easily understood how abnormal shortness of the cord may favour the origin of fissure of the abdomen; while a cord of disproportional length may coil round one of the extremities, and by constriction may dwarf it, or even amputate it. 4. Morbid influences acting directly on the fetus, as mechanical injuries and diseases affecting it, are the most frequent causes of malformations. From the experiments of several observers, it has been shewn, that by submitting hens' eggs to various mechanical influences during incubation, the development of the embryo may be interrupted, or modified in such a manner as to give rise to malformations; and many observations tend to prove, that mechanical influences affecting the womb (kicks, blows, or falls) in the early months of pregnancy, produce certain malformations, by causing an arrest of development. Moreover, the fact, that certain malformations usually occur only in twin or triplet pregnancies, favours the view, that certain monstrosities are due to pressure and confined space.

Of the various classifications of monstrosities, the following is perhaps the best: 1. Malformations in which certain parts of the normal body are entirely absent, or are too small. 2. Malformations produced by fusion or coalescence of organs. 3. Malformations in which parts naturally united, as in the mesial line of the body, are separated, and clefts or fissures occur. 4. Malformations in which natural openings are closed. 5. Malformations of excess, or in which certain parts have attained a disproportional size. 6. Malformations in which one or more parts have an abnormal position. 7. Malformations of the generative organs.

The first class includes (1) completely shapeless malformations, in which the monster presents the appearance of a lump or mass, with no indication of definite organs; (2) malformations which consist of only a more or less rudimentary trunk, with no head or extremities; (3) trunkless monsters, in

## MONSTROSITY—MONTAGNARDS.

which the inferior parts of the body are wanting, and little more than a rudimentary head is present, which, instead of neck and trunk, is furnished with a pouch-like appendage, containing rudimentary viscera and pieces of bone; (4) malformations in which the head, and sometimes a part of the upper part of the body, are wanting, constituting acephalic monsters, which are by no means rare, the number of recorded cases in the human subject being over 100; (5) malformations in which the whole head is not absent, but some of its component parts are wanting—as, for example, the brain, some of the cranial bones, the nose, or the eyes; (6) cases in which the extremities are absent or imperfect to a greater or less degree—for example, they may be mere stumps, with the fingers and toes either absent or rudimentary, or the hands and feet may appear to exist independently of arms and legs, and to be inserted immediately into the trunk; (7) cases in which all the organs may be present, but some of them may be too small—thus, there may be general dwarfishness, or the head or limbs may be abnormally small. None of the monsters of this class, except those included in the last two groups, are viable.

In the *second class* are included such cases as (1) the various forms of *cytoplegia*, or coalescence of the eyes; these malformations are not very rare in the human subject, and are of frequent occurrence in pigs and other animals; although usually born alive, these monsters are not viable; (2) coalescence of the lower extremities either into a common limb, which supports two feet, or into an undefined tail-like mass; (3) minor amalgamations, which do not affect vitality, as more or less perfect coalescence of the fingers and toes.

The *third class* embraces such cases as (1) fissures of the cranium, which are generally due to hydrocephalus in the fetus; (2) harelip and cleft palate; (3) fissures on the neck, whose origin is due to the respiratory clefts—which, during the formation of the embryo, appear in the cervical region, not uniting at an early stage, as in the normal condition, but remaining more or less open; (4) fissures of the vertebral arches of the spinal column, occasioning the affection known as *spina bifida*; (5) fissures of the thorax, in which case the lungs or heart are more or less exposed; (6) fissures of the abdomen.

The malformations of the *fourth class* include congenital closure of the anus, the mouth, the nostrils, &c.

The malformations of the *fifth class* may be arranged in two divisions, according as certain parts are too large, or there are supernumerary organs.

The *sixth class* is very extensive, and embraces many varieties. One or more parts may be disproportionally large—as, for example, the head in cases of congenital hydrocephalus; or there may be one or several supernumerary organs—a sub-class which presents a very great range, from the simplest cases, in which a single joint of a finger is supernumerary, to those of a highly complicated nature, when two or even three bodies are united by some one point. There may be a single head and trunk and supernumerary parts—as, for example, supernumerary teeth, vertebrae (giving rise to the formation of a tail in the human subject), ribs, mammae, fingers, toes, &c.; or there may be malformations with more than one head and trunk—double, or even triplet monsters. This sub-class is divisible into two groups, according as the united individuals are equally developed, or as only one is developed; the second being more or less atrophied, and forming a parasitic appendage to the first. As examples of the first group, we mention (1) duplication of the head and upper part of the vertebral column; (2) dupli-

cation of the head, neck, and upper extremities, while the chest and abdomen are single, or fused into one another (in this group, we must place the twin-monster, Rita Christina, who was born in Sardinia in March 1829, and was brought alive to Paris, where she died in the November of that year); (3) almost complete duplication, with separation of the two bodies, except at a single spot, as in the case of the Siamese twins; (4) triplet monsters, such as the child with three heads born in 1832 in Catania (see Geoffroy St Hilaire, *Histoire des Anomalies de l'Organisation*, vol. iii. p. 327). To the second group belong such cases as the following: (1) a perfect individual may bear on its head another head, with traces of the rest of the body; (2) on a well-developed body, a second, smaller and defective one, may be situated, which, after birth, does not increase in size; (3) in a more or less perfectly developed individual, there may be concealed, commonly in the abdomen, parts of a second individual—a condition which has received the name of *fetus in fetu*, and which is most probably caused by the inclusion of one germ by another.

To the *sixth class* belong (1) those cases in which there is a reversing of the position of the internal organs—when the heart and spleen lie upon the right, and the liver and cæcum on the left side; (2) anomalies in the course and distribution of individual vessels.

The malformations constituting the *seventh class* have been sufficiently noticed in the article HERMAPHRODITISM.

The term *Teratology* (from the Greek words *teras*, a prodigy, and *lógos*, a discourse) is now frequently applied to the history and science of monstrosities. —For further information on this subject, the reader is referred to Geoffroy St Hilaire, *Histoire des Anomalies de l'Organisation* (3 vols. 1832–1836); Otto, *Monstrorum Seecentorum Descriptio Anatomica* (1841); and to the article 'Teratology,' by Vrolik, in *The Cyclopædia of Anatomy and Physiology*.

MONSTROSITY, in Botany, is a malformation or abnormal development of any part of a plant. It may take place, however, at any period of the growth of a plant, as to any new organ that is developed, and sometimes merely affects a particular organ or some portion of a plant, as a particular leaf, flower, petal, sepal, &c., or the leaves or flowers of a particular branch, whilst in other cases all the organs of the same kind exhibit the same abnormal character. As in animals, it is now well known that monstrosities in plants are the result of special conditions affecting the operation of ordinary natural laws; and the study of monstrosities is very important in relation to that of the nature, development, and metamorphosis of organs. In the article METAMORPHOSIS OF ORGANS, some of the most frequent monstrosities are alluded to. Monstrosities in plants are not always, as in animals, reckoned deformities. *Double flowers* afford a familiar example of an opposite kind; although with regard to the plant itself they have the effect of unfitting it for one of the functions of a perfect plant, reproduction by seed.

MONTAGNA'NA, a town of Northern Italy, in the province of Padua, situated pleasantly on the banks of a canal, Il Fiumicello, 32 miles south-west of Padua. It is still protected by walls and towers, and has a fine cathedral and palace. Pop. 7657. Its chief trade is in spun-silk, wool, hemp, and coarse cotton textures.

MONTAGNARDS, or simply MONTAGNE, 'the Mountain,' the name given to the extreme democratic politicians in the first French Revolution, because they seated themselves on the higher benches of

the hall in which the *National Convention* met. Their principal members were Danton, Marat, Robespierre, St Just, and Collot d'Herbois, the men who introduced 'the Reign of Terror.' The opposite party of the 'Plain' (*Plaine*) were the Girondists (q. v.), who sat on the lowest benches on the floor of the house. After the overthrow of the Girondists, this part of the house was styled the 'marsh or swamp' (*marais*), and included all the subservient members whose votes were under the control of 'the Mountain.' A few leading men gave all its strength and formidable character to the party of the Mountain.—After 1848, the extreme party in the *National Assembly*, composed of revolutionary democrats and communists, sometimes flattered itself with the designation of 'the Mountain;' but events proved that it possessed nothing of the genius, though it shewed all the malignity of its terrible predecessor.

**MONTAGU, FAMILY OF.** This noble family are said, by Burke, to derive their name, which in Latin was and is always written *De Monte Acuto*, from a place in Normandy; and the first of the Montagus who settled in England was a warrior who came over in the train of Robert Earl of Moreton at the Conquest. Five centuries later, we find his descendant, Sir Edward Montagu, Lord Chief-justice, in succession, of the courts of King's Bench and Common Pleas under Henry VIII., who also appointed him one of the executors of his will and guardians of his son Edward. His grandson, who was a distinguished orator, represented the city of London in parliament; and having been Lord Chief-justice of the Court of King's Bench, and Lord Treasurer of the kingdom, was raised to the peerage as Earl of Manchester. The second earl gained distinction as a general in the Parliamentary army, and more particularly by his victory over Prince Rupert at Marston Moor; but he scrupled to take part in the condemnation and execution of Charles, and was one of the first members of the House of Peers who gave in his adhesion to Charles II. on his restoration. This nobleman's grandson enthusiastically espoused the cause of William III., under whom he fought at the battle of the Boyne, and took part in the siege of Limerick. He was subsequently sent as ambassador to Venice, and to the courts of France and Vienna, and eventually was raised to the dukedom of Manchester by George I. The title is still enjoyed by his descendant, the 7th duke. Other branches of the M. family were ennobled in the persons of the Earl of Sandwich, the Earl of Halifax, and the Duke of Montagu, but the last two titles both became extinct before the close of the 18th century.

**MONTAGU, LADY MARY WORTLEY,** was eldest daughter of Evelyn, Earl, and afterwards (1715) Duke of Kingston. She was born about 1690, and is said to have received a classical education. When only eight years of age, she was introduced by her father to the famous *Kitt-Cat Club*, and formally admitted a member. Her fond and pleasure-loving father allowed her to educate herself. She is even said to have taught herself Latin. She became attached to Mr E. Wortley Montagu, a member of the House of Commons, whose cousin, Charles Montagu, was created Earl of Halifax, and appointed First Lord of the Treasury, by George I. As the match was disapproved of by the families, she was obliged to elope before she could marry him. On the accession of George I., she came to London with her husband, who was a Whig. Lady Mary's beauty and wit attracted universal admiration at court. She was in habits of familiar acquaintance with Addison and Pope, the latter becoming her

enthusiastic admirer, and writing 'flames and raptures' for her, until his passion 'came to a climax in an impertinence, and was extinguished by a box on the ear, or some such rebuff.' In 1716, Mr Wortley Montagu was appointed ambassador to Constantinople. He was accompanied by Lady Mary, who, on her journey, and during her residence in the Levant, wrote the well-known *Letters*, which form one of the most delightful books in our language. The weakness of a somewhat vain and capricious temper fade into forgetfulness, when we remember the strong sense, enlightened courage, and generous perseverance which introduced into Europe the practice of inoculation, which she witnessed in Turkey. She had so much faith in its safety, that she tried it first on her own son. See *INOCULATION*. After her return to England, she fixed her residence at Twickenham, and renewed her intimacy with Pope. But political soon led to personal differences, and these resulted in one of the most famous literary feuds of the 18th century. The immediate occasion of it was the publication by Lady Mary of her *Town Eclogues*. She was fiercely assailed by both Swift and Pope, and was not slow to retaliate. In 1737, she left her country and her husband (for reasons that are not known), and lived for many years in Italy, chiefly at Lovere, in the province of Venice. Her husband died in 1761. At the request of her daughter, afterwards wife of the Earl of Bute, she returned to England, where she died 21st August 1762. A collected edition of her works, with life, was published by her great-grandson, the late Lord Wharfedale, in 1836, of which a third edition appeared in 1861.

**MONTAIGNE, MICHEL EYQUEM DE,** a distinguished French moral philosopher, was born in 1533, at his paternal home of Montaigne, in Perigord. In accordance with his father's eccentric ideas on education, he was taught, and suffered only to speak Latin from his earliest infancy, in consequence of which he acquired such a perfect mastery over the language, that when, in his tenth year, he entered the college of Bordeaux, his masters, Grouchi, Buchanan, and Muret, were almost afraid to address him. On the expiration of his course of studies, which were directed to law, he received, in 1554, the appointment of councillor in the parliament of Bordeaux; but being possessed of ample means, and having no inclination for a public life, he devoted himself to the study of the various schools of Greek and Roman philosophy; and on the death of his father, in compliance with whose wish he had made a translation of the natural theology of Raymundus Sebondus (Paris, 1569), he retired to his ancestral estate, where he lived in retirement during the terrible season of religious oppression which desolated France for so many years. During this period, 1580, he composed the first two books of his celebrated *Essais*, the third portion of which appeared in 1588, after his return from an extensive course of travels, which he had undertaken partly to escape from the plague, and partly for the improvement of his own health, and during which he visited Rome, and was received with signal favour by the pope. M's *Essais*, although not conceived in the spirit of a believing Christian, or marked by the reticence and delicacy of expression which modern refinement demands, are very extraordinary productions, not only for the learning and sound reasoning which they manifest, but also for the frank and liberal tone in which social questions are discussed, notwithstanding that the author wrote at a period when religious differences and party feelings blinded the judgments of men. M's ethics were those of Seneca and the other philosophers of ancient times, whose works he had so

thoroughly mastered; and, judged from our point of view, his morality is that of a virtuous pagan merely; but when we bear in mind the turmoil of civil war, and the consequent disorganisation of society, together with the low ebb of literature in France at that period, we must do justice to the great merit of the writer, and the influences for good which his writings exerted. M. was a constant, and occasionally a successful mediator between the party of Henry of Navarre and that of the Guises, and stood in relations of friendship with men of all creeds. He died in 1592, as an avowed member of the Church of Rome, in whose doctrines he professed implicit faith, notwithstanding the sceptical bias which he had through life been at no pains to conceal. Numerous editions have appeared of his *Essais*, among which we may instance those of De Coste (5 vols. Hag. 1727), and Victor Leclerc (Paris, 1826). Nearly 200 years after his death, the discovery was made at Montaigne of the MS. of his travels, which was published at Paris in 1774, under the title of *Journal de Voyage de M. de M. en Italie par la Suisse et l'Allemagne*. Translations of the *Essais* exist in almost all the European languages; the best English translation is that by Cotton. The best biographies of M. are by Grün (Paris, 1855); Payen (Paris, 1856); and Bayle St John (Lond. 1857).

**MONTALCINO**, a town in the province of Tuscany, Central Italy, 22 miles south-south-east of the town of Siena, stands on a hill in the midst of valleys, and enjoys a fine equable climate. Pop. 7540. The wine of M. is in high repute throughout Tuscany.

**MONTALEMBERT**, CHARLES FORBES, COMTE DE, was born in April 1810 of an ancient family of Poitou. His father was created a peer of France under the Restoration, and for a considerable time was minister of the French court in Sweden. His mother was of the Scottish family of Forbes, to which circumstance may be ascribed M.'s remarkable familiarity with the English language, and his intimate knowledge and strong admiration of the social and political institutions of England. Although his more advanced studies were carried on in the university of Paris, a considerable part of his youth was spent in Sweden; and the first work by which he was brought into notice, was a pamphlet on Sweden, which he published in his nineteenth year. On the death of his father, M. succeeded to his honours, and to his seat in the Chamber of Peers. But his earliest public appearance was in what may be truly considered as the great labour of his life, a joint effort in which he associated himself with the Abbé Lacordaire (q. v.) and other friends, for the purpose of taking advantage of the recent charter, by establishing a free school for Catholic education, independent, as well of the university, as of all other state influence. An attempt on the part of the police to interfere arbitrarily with this project, became the subject of a trial before the Chamber of Peers, which M. rendered memorable by his first speech, one of the most brilliant upon record, and a clear foreshadowing, not alone of the eloquence, but of the bold and uncompromising earnestness in the cause of his church and of the common interests of religious liberty, which have constantly characterised his later career. Of the struggle of the Catholic party in France against what they regarded as the arbitrary monopoly of education which was claimed for the university, M. was for many years the leader and the champion; and in the various works in the preparation of which he employed all his leisure from public duties, his *Life of St Elizabeth of Hungary*, his *Life and Times of St Anselm*, and,

above all, in an appeal *On the Duty of Catholics on the Question of Freedom of Education*, which he wrote during a visit to the island of Madeira for the recovery of his health in 1843, he never ceased to advocate the same principles. After the revolution of 1848, M., true to his former professions, was one of the first of his party to accept of the new state of things, and to use the actual means at his disposal for the furtherance of the views which he had consistently advocated. He was elected member of the National, and afterwards of the Legislative Assembly; and for a time contrived, while he continued the same line of policy as regards church interests, to give a general support to the government of Louis Napoleon as president of the republic. His first break with that government was on the question of the proposed confiscation of the Orleans property; and after the *coup d'état* of December, the breach became irreconcilable. From that time, M. continued to be the implacable assailant of the arbitrary repression of public opinion which characterised some measures of Napoleon III.; and the brilliant and enthusiastically admiring pictures, which in his *Political Future of England*, he has drawn of the social and political institutions of that country, derive much of their brilliancy and vigour from the covert but palpable contrast with the condition of the author's native land which points them all. Besides numerous articles contributed by him to the *Revue des Deux-Mondes*, the *Encyclopédie Catholique*, and the *Correspondant*, of which he was joint-editor, he also wrote: *L'Avenir politique de l'Angleterre* (1855); *Pie IX. et Lord Palmerston* (1856); *Les Moines d'Occident depuis St Benoît jusqu'à St Bernard* (1860—1867); *Une Nation en deuil, la Pologne en 1861* (1861); *L'Eglise libre dans l'Etat libre* (1863); *Le Pape et la Pologne* (1864), &c. He died 13th March 1870.

**MONTANA**, a territory of the United States, formed in 1864, extending from lat. 45° to 49° N., and long. 104° to 116° W. It is mostly to the east of the Rocky Mountains, and is bounded, N. by British America, W. by Washington and Idaho, S. by Wyoming, E. by Dakota. Its average length is 470 miles, its average breadth 310 miles, and its area 143,776 sq. miles, or 92,016,640 acres, of which, in 1870, 84,674 were under cultivation. M. has great mineral wealth, not yet fully taken advantage of, including gold, silver, galena, copper, coal, and precious stones. Its yield of gold in 1869 was valued at 12,000,000 dollars. It is exceedingly well watered, the chief rivers being the Missouri and Yellowstone, with their affluents, and the Columbia. M. is remarkably well adapted for grazing. Its pop. in 1870 was 20,595, principally engaged in mining.

**MONTANUS**, a celebrated heresiarch of the early Christian Church, was a Phrygian by birth, and made his first public appearance about 160 A.D., in the village of Ardabar, on the confines of Phrygia and Mysia. He was brought up in heathenism, but embraced Christianity with all the fanatical enthusiasm for which his countrymen were noted.

M.'s stand-point was, *in theory*, the exact opposite of that occupied by the Gnostic sects; yet, *in practice*, it led to a similar exclusiveness and sectarianism. He believed in the constancy of supranatural phenomena *within* the church. The miraculous element, particularly the prophetic ecstasy, was not removed; on the contrary, the necessity for it was greater than ever. He considered those only to be true or perfect Christians who possessed the inward prophetic illumination of the Holy Spirit—they were the true church; and the more highly gifted were to be looked upon as the genuine successors of the apostles, in preference

to the mere outwardly consecrated bishops. Thus, they formed a religious aristocracy, as arrogant as the Gnostics; the difference between the two simply being, that the Montanists prided themselves on a kind of inflamed inspiration, and the Gnostics on a calm and serene illumination of the reason. Neither party wished to recede from the Catholic Church, but rather to exist as an esoteric body within its pale. It was persecution, caused, no doubt, by their own insolent obstinacy, that forced them into a sectarian course. M. did not meddle directly with the creed of the church; in fact, he was not a thinker, nor a man of almost any importance intellectually. His efforts were confined to stirring up the Christians generally to fresh religious life—to a belief in a fresh outpouring of the Holy Ghost! At first, M. contented himself with predicting fresh persecutions, exhorting men to greater strictness and holiness of life, and announcing judgments to come upon the persecutors; but his idea of his own mission afterwards became more exalted, and he claimed to be in a very special sense a prophet of God—the organ chosen by the Holy Ghost to purify, enlighten, and advance the church. Among the things on which the Montanists laid stress, was an ascetic mode of life, scorn of persecution, and love of martyrdom; connected with these, and, indeed, flowing from them, was an aversion to second marriages, and to the restoration of the Lapsed (q. v.). Like other enthusiasts, they also were firm believers in the near approach of the Millennium (q. v.), and in the personal advent of Christ. Two 'prophetesses,' Priscilla and Maximilla, were associated with M. in his work. A decree for the expulsion of M. and his followers from the communion of the Catholic Church was issued by Eleutherus, Bishop of Rome. The Montanists at once proceeded to organise themselves as a distinct sect. They found a singularly able apologist in Tertullian (who became a Montanist about 200 A.D.), and continued to exist till the 6th century.

**MONTARGIS**, a town of France, department of Loiret, is situated at the junction of the canals of Orleans and Briare with that of Loing, 40 miles east-north-east of the city of Orleans. M. has some cloth and leather manufactures, and considerable trade in corn, cattle, &c. Pop. (1872) 8196. In its vicinity is an extensive forest of the same name.

**MONTAUBAN** (Lat. *Mons Albanus*), a town of France, capital of the department of Tarn-et-Garonne, is situated in a rich and beautiful country on a plateau between the rivers Tarn and Tescou, 32 miles north of Toulouse. It is the seat of a bishop, has a fine cathedral in the Italian style, finished in 1739, built on the site of a still older monastery, the *Mons Aureolus* (Golden Hill), and is a well-built, handsome town. The houses are mostly of brick. Besides having considerable manufactures, it carries on a great trade in wine, grain, leather, &c. M. was founded in 1144 by Count Alphonse of Toulouse, became the seat of a bishop in 1317, embraced the Reformation in 1572, and suffered severely in the civil wars that ensued. It has acquired historical celebrity as the great stronghold of the Huguenots. Protestantism still exists here, and maintains both an academy and a theological college. Pop. (1872) 25,624, nearly one-half of whom are Protestants.

**MONTBELIARD** (Ger. *Mömpelgard*), a town of France, in the department of Doubs, 36 miles north-east of Besançon. It lies in a valley between the Vosges and Jura Mountains, is surmounted by an old château, now used as a prison, and carries on manufactures of cotton goods, hosiery, and silks.

Clocks, watches, and agricultural implements also made. Pop. (1872) 6509.

**MONT BLANC**, the highest mountain in Europe, and, according to the latest measures 15,781 feet above the level of the Mediterranean Sea, is one of the Graian Alps, and is situated in the department of Haute-Savoie, France, on the Italian frontier, and 37 miles south of the east end of the Lake of Geneva. The vales of Chablais and Mountjoie lie on the west, and those of Isère and Allée Blanche on the east side of it. The waters which spring from its western slopes drained off to the Arve, and thence to the Rhone, while those which rise on the east side are fed by the Dora Baltea, a tributary of the Po. It has snow-clad peaks, and 36 glaciers, of which 16 are on the north, and 20 on the south side. The highest summit is a narrow ridge 50 yards by 16, called *Bosse du Dromedaire*, covered with firm snow, and very steep towards the north. In 1760, Saussure offered a prize for the discovery of a practicable route to the summit of Mont B., which was gained in June 1786, by Jacques Balmat, a guide. Saussure himself ascended the mountain the following year; and the same feat has since been performed by many, especially since Albert Smith published the well-known pictorial and dramatic description of his ascent in 1851.

**MONT CENIS**. See **CENIS**.

**MONT DE PIÉTÉ**, called in Italy *Monte di Pietà*, a charitable institution, the object of which is to lend money to the very poor at a moderate rate of interest. It had its origin at the close of the medieval period, when all such transactions were in the hands of usurers, to whom the necessities of the poor were but an inducement to the most oppressive extortion. The earliest of these charitable banks appears to have been that founded at Padua in 1491, which was so successful as to lead, according to contemporary writers, to the closing of the Jewish banks in that city. The first opened in Rome was under Leo X.; and the Roman *Monte di Pietà* are confessed to have been at all times the most successful and the best managed in Italy. The institution extended to Florence, Milan, Naples, and other cities. The principle of all these banks is to advance small sums, not ordinarily exceeding five crowns, on the security of pledges, but at a rate of interest barely sufficient to cover the working expenses of the institution. Should any surplus remain, it was to be expended for charitable purposes. The *Monte di Pietà* system was introduced also in Spain, and in the Spanish provinces of the Netherlands. It formed the model of the *Lending Fund Board of Ireland*, established by 6 and 7 V. c. 91. See **PAWNBROKING**.

**MONTEBELLO CASTEGGIO**, a village of Northern Italy, in the province of Voghera, 15 miles east-north-east of Alessandria. It stands on a plain on the banks of the torrent Schizzola. In 1800 the Austrians were defeated by a French army under General Lannes, after a desperate conflict, on June 1800. The title of Duke of Montebello was conferred on the victorious French general five years later. In May 1859 the Austrians were again defeated here by the united armies of the French and Piedmontese.

**MONTE-CASINO**. See **CASINO**, **MONTI**.

**MONTE-CATINI**, a village of Tuscany, situated on a spur of the Apennines, 29 miles west of Florence, derives its name from the bowl-shaped hill on which it stands. It is of very ancient origin and was formerly called *Castello*. In the vicinity of the town are the famous mineral springs.

# MONTÉ CHIARO—MONTENEGRO.

same name, in high repute for their curative virtues, especially in diseases of the liver and stomach. Excellent accommodation can be had by persons both in private establishments and those in government direction.

**MONTÉ CHIARO**, a town of Northern Italy, in the province of Brescia, situated on a height on the bank of the Chiese, in the centre of an amphitheatre of hills. Pop. 6933. The chief manufacture is silk. In 1796, the Austrians were defeated here by the French army.

**MONTÉ CRISTO**, a small island, belonging to Italy, 26 miles south of Elba. It consists of a mountain of granite 1983 feet above the level of the sea and is uninhabited except by wild goats and other animals. It is inaccessible except by one small landing-place. M. C. has given name to Scott's well-known novel.

**MONTENEGRO**, RAIMONDO, COUNT, born near Verona, 1608, and entered the Austrian artillery as a volunteer under his uncle, Ernesto, Count Monteculi, in 1627. During the Thirty Years' War he found many opportunities of distinguishing himself, received rapid promotion, and was employed in various services, military and diplomatic. In 1641, he was sent to support the king of Poland, Casimir, against the Swedes and Rákóczy, which he did with great effect, compelling Rákóczy to make peace with Poland, and to break his alliance with the Swedes. In the following year, he was made a field-marshal, and was sent to aid the Danes against the Swedes, in which also he was eminently successful. In 1660, he commanded the army sent to oppose the Turks, who had broken into Transylvania, and skilfully kept them in check till the arrival of the French, with whose assistance he won the great battle of St Gotthard, on the banks of the Danube, 1st August 1664—the first decided triumph of European tactics and discipline over the mere numbers and daring of the Ottoman hosts. When war broke out between France and Holland, which the emperor took part with Holland, M. received the command of the imperial army in 1672. He took Bonn, and notwithstanding the efforts of Turenne to prevent it, effected a treaty with the Prince of Orange. In 1675, he opposed to Turenne on the Rhine, and they fought four months in manoeuvres in which neither gained any advantage. After this campaign, he spent the remainder of his days at the imperial court and in the society of learned men. He was himself a man of learning and various accomplishments, and has left works on the art of war, the Turkish war, and on the war of 1664, and sonnets. The Emperor Leopold made him prince of the empire, and the king of Naples owed him the duchy of Melfi. He lost his life by the fall of a beam as he was entering Linz at the imperial court, 16th October 1681. His works were published in the original Italian by Foscolo (2 vols. Milan, 1807); and by J. Grassi (2 vols. Turin, 1821). A semi-autobiographic memoir translated into Latin, and published at Vienna, under the title of *Commentarii Bellici*, in 1718.

**MONTÉGO BAY**, a small but flourishing port on the north coast of the island of Jamaica, 15 miles west of Falmouth. It has a harbour protected by a breakwater, is defended by a battery, and carries on a general trade of some importance. More than 100 vessels annually enter and clear the port. Population variously stated at from 4000 to 5000.

**MONTÉLIMAR**, an ancient town of France, in the department of Drome, about two miles from the left bank of the Rhone, and 26 miles south of

Valence. It stands on the slope of a hill covered with vineyards. There are factories for silk and cotton goods; tanneries, &c. Pop. 11,122.

**MONTENEGRO CUSTOM** was a triennial procession of the Eton boys, on Whit-Tuesday, to a certain mound (*ad Montem*) known as the Salt Hill, near the Bath Road, and which was doubtless so called because certain of the boys levied tribute (for salt, as the phrase went) from every person present, and even from any chance passer. These juvenile tax-gatherers were attired in fancy dresses of silk. The king and queen, besides many members of the nobility, frequently honoured the procession with their presence; and on such occasions, as much as £1000 has been collected, which was given to the senior scholar to support him at Cambridge. The origin of the custom is unknown. It was discontinued in 1847.

**MONTENEGRO** ('Black Mountain'), called by the natives **TZERNAGORA**, and by the Turks **KARADAGH**, all three names expressive of the peculiar features of the country, is a small principality, situated between the Turkish eyalets of Bosnia and Albania, and separated from the Adriatic by the narrow strip of land known as the Circle of Cattaro, in Austrian Dalmatia. It contains about 1880 square miles, and is everywhere mountainous, the mountains being in most cases clothed with dark forests of fir, ash, beech, oak, ilex, willow, and poplar. Mount Dormitor, in the north, is 8500 feet, and Kutsh Kom, in the east, 9300 feet above sea-level. Agriculture is prosecuted to the utmost extent the country will admit of, but in an extremely rude and primitive manner. The products are those of other European countries in the same latitude. The Sumach (q. v.), one of the most valuable of the natural trees, is not uncommon. Few oxen are reared, but sheep, goats, and swine abound.

There are no towns in M., and the largest village contains only 1200 inhabitants. Cettigne or Cettinji, the seat of government, contains between twenty and thirty well-built houses, besides a convent and the palace of the Prince of Montenegro. The villages are unwallled; the houses, or rather huts, which compose them, are very rarely provided with chimneys, and in the elevated districts are more wretched in appearance than even the mud-hovels of Ireland.

The Montenegrins or Tzernagorzes are Slavs of the Servian race, and number about 130,000. They are knit together in clans and families, and have many feuds amongst themselves, which are perpetuated by the hereditary obligation of avenging blood. Their chief occupations at home are agriculture and fishing, but they are ever ready for war or pillage. Education among them is at a very low ebb; in fact, it is held in contempt, and many, even among the priests, are unable to read or write. In 1841, several schools were established, and the art of printing introduced; but the unsettled state of the country has hitherto prevented much improvement. Their language is a very pure dialect of the Slavic. They belong to the non-united Greek Church.

**Political Divisions and Government.**—M. is divided into the districts of M. Proper, and Brda or Zjeta, each of these being subdivided into four 'nahies' or departments, and these are further subdivided, each subdivision having its own hereditary chief. Some islands in the Lake of Scutari also belong to Montenegro. Until 1851, the head of the government was the *Vladika* ('metropolitan,' or 'spiritual chief'), who, besides his proper office of archbishop and ecclesiastical superior, was at the same time

chief ruler, lawgiver, judge, and military leader. This theocratic administration became (1697) hereditary in the Petrovitch family, but as the vladika cannot marry, the dignity was inherited through brothers and nephews. Since 1851, the two offices have been disjoined, and the vladika is restricted to his ecclesiastical office, while the cares of government devolve upon the 'Gospodar' ('hospodar') or lord, though the common people still apply to him the title 'sveti gospodar,' which properly belongs to the vladika alone. The vladika Pietro II. (1830—1851) established a senate of twelve members, elected from the chief families of the country, and in this body the executive power was vested. Next to the vladika in ecclesiastical affairs is the archimandrite of the convent of Ostroec. The other public officers, as the Secretary of State, the Chancellor, and the local judges, are appointed by popular election. From time to time, an Assembly of all the adult males of the country takes place in a grassy hollow near Cetigne, the capital; but the powers of this assembly are very undefined. For defraying the expenses of government, taxes are levied on each household, the income thus raised amounting to 40,000 Austrian florins, or £4068. Besides this, the prince receives from Russia a subsidy of 8000 ducats (£3735), and from France one of 50,000 francs (£1980). As the Montenegrin, even when engaged in agricultural operations, is always armed with rifle, yataghan, and pistol, an army of 25,000 men can be summoned on the shortest notice, and in desperate cases, 14,000 more troops can be raised. Their intense love of independence, and heroism in the defence of their country, is worthy of the highest respect; but out of their own country, they are savage barbarians, who destroy with fire and sword everything they cannot carry off.

There is little trade in M., yet hides, wool, venison, dried and smoked fish, mutton and goat flesh, bacon, lard, &c., are exported in considerable quantities. These goods are carried to Cattaro by the women, aided occasionally by mules, for, owing to the absence of roads (a precaution against invasion), carts are unknown. Austrian and Turkish coins form the currency, as M. has no mint of its own.

*History.*—M. belonged in the middle ages to the great Serbian kingdom, but after the dismemberment of the latter, and its conquest by the Turks at the battle of Kossovo (1389), the Montenegrins, under their prince, who was of the royal blood of Serbia, maintained their independence, though compelled to relinquish the level tracts about Scutari, with their chief fortress of Zabliak, and confine themselves to the mountains (1485). In 1516, their last secular prince resigned his office, and transferred the government to the vladika. The Porte continued to assert its claim to M., and included it in the pashalik of Scutari; but the country was not conquered till 1714, and on the withdrawal of the Turks soon afterwards, it resumed its independence. In 1710, they had sought and obtained the protection of Russia, the czar agreeing to grant an annual subsidy on condition of their harassing the Turks by inroads, and this compact has, down to the present time, been faithfully observed by both parties. Another part of the agreement was, that the archbishop or vladika was to be consecrated by the czar. In 1796, the Prince-bishop, Pietro I., defeated the Pasha of Scutari, who had invaded M., with the loss of 30,000 men; and for the next quarter-century we hear no more of Turkish invasions. The Montenegrins rendered important aid to Russia in 1803 against the French in Dalmatia, and took a prominent part in the attack on Ragusa, the capture

of Curzola, and other achievements. Pietro who ruled from 1830 to 1851, made great efforts to civilise his people, and improve their condition. He established the senate, introduced schools, endeavoured, though unsuccessfully, to put an end to internal feuds, and predatory expeditions into the neighbouring provinces. Some Turkish districts having joined M., the Turks attacked the latter in 1832, but were repulsed. A dispute with Austria regarding the boundary resulted in a war, which was terminated by treaty in 1840. In 1851, the last prince-bishop died, and his successor, Danilo separated the religious from the secular supremacy, retaining the latter under the title of Gospodar. This step caused the Czar Nicholas to withdraw a subsidy (which was renewed, and the arrears paid by the Czar Alexander II.), and the imposition of taxes thus rendered necessary, caused great confusion. This was taken advantage of by the Turks, who, under Omer Pasha, invaded the country; but the intervention of the Great Powers compelled a treaty, February 15, 1853. Danilo went in vain to the Paris conference in 1857, seeking the recognition of M. as independent. In 1860, the Montenegrins excited an insurrection against the Turkish rule in the Herzegovina, which was soon suppressed, and on their return they were so hard pressed by the Turks, that they were glad to agree to a treaty (8th September, 1862) by which the sovereignty of the Sublime Porte over M. was recognised. Though this relation has remained unchanged, there have been many disputes between the two countries since that date; M., however, settled without an appeal to arms.

**MONTENOTTÉ**, a small village of Northern Italy, 26 miles west of Genoa, where the Austrians were defeated by the French in a great engagement on the 12th April 1796.

**MONTEPULCIANO**, a city of Italy in the province of Arezzo, 56 miles south-east of Florence. Pop. about 2000. It stands on a high mountain, and is surrounded by medieval walls. It has a fine church and several palaces. It is supposed to occupy the site of an Etruscan city of great antiquity; and numerous Etruscan remains have been excavated in the neighbourhood. The wines of M. are famous throughout Italy.

**MONTEREALÉ**, a town of Southern Italy, in the province of Abruzzo Ulteriore, 14 miles north-west of Aquila. Pop. 5014. It stands on a hill in the midst of a vast plain, and has several elegant churches. In the neighbourhood, there are vast chestnut-groves, which furnish the poor inhabitants with the chief article of their subsistence.

**MONTEREAU**, a town of France, in the department of Seine-et-Marne, at the confluence of the Seine and Yonne, 46 miles south-east of Paris, at which there is communication by steamboat. The manufactures are earthenware and leather. Here, in 1419, Jean-sans-Peur, Duke of Burgundy, was assassinated, at the instigation and in the presence of the Dauphin, afterwards Charles VII.; and in the immediate vicinity, Napoleon, on February 21, 1814, gained his last victory over the allies.

**MONTEREY**, the most thriving city of San Francisco, capital of the state of Nuevo Leon, Mexico, a tributary of the Rio Grande, 17 miles west of Matamoros. It is well paved and stands on a broad plain, 1626 feet above sea level, and is surrounded by beautiful gardens and orchards. Pop. in 1889, 13,500. From its facilities for commerce are great; and it is an entrepôt for the transport of American goods to the Rio Grande to the inland states of Durango and Zacatecas. In the war between the United States and Mexico, it was captured by the

## MONTÉ ROSA—MONTEZUMA.

1 Mexico, M. capitulated, 24th September 1846, after a siege of four days, to the American forces under General Taylor.

**MONTÉ ROSA**, the *Mons Sylvius* of the ancients, is the highest mountain in Europe after Mont Blanc. It is situated in the angle where the east end of the Pennine meets the Lepontic Alps, and separates the canton of Valais from Italy. The northern portion of the mountain is highest, and has nine peaks, the highest of which is forked and precipitous, and attains an altitude of 15,210 feet above sea-level. Many attempts were made to ascend this peak, but none were successful till 1855. The mountain appears to consist of mica-slate, in some places alternating with gneiss. It is rich in metallic ores, and several mines of gold, copper, and iron are worked. The highest mine is between 10,000 and 11,000 feet above sea-level, and in the region of perpetual snow. Rye ripens up to an elevation of 6000 feet; and the vine is found as far as 3200 feet; but there is a difference of nearly 100 feet in the altitude of the corresponding vegetation on the north and south sides.

**MONTÉ SANT' ANGELO**, a city of Southern Italy, in what was formerly the province of Capitanata, 28 miles north-east of Foggia. It stands on one of the Gargano group of hills, at a height of 300 feet, and has numerous fine churches. It is noted for its exquisite honey, gathered from the fragrant alpine plants of the mountain. Pop. 336.

**MONTÉ SAN GIULIANO**, a town of the south of Sicily, province of Trapani, situated on a high mountain 4 miles east-north-east of the town of Trapani. On the mountain (anciently *Eryx*) are the remains of a once famous temple of Venus. Pop. 10,542.

**MONTÉ SARCHIO**, a town of Southern Italy, in the province of Benevento, 13 miles north-west of Isernia, on the torrent Correo. Pop. 5600.

**MONTESQUIEU**, CHARLES DE SECONDAT, MARQUIS DE LA BRÈDE ET DE, one of the most celebrated authors and political philosophers of France, born 18th January 1689, at his father's château of Madaillan near Bordeaux, and descended from one of the most distinguished families of Guienne. In his youth he was a hard student of jurisprudence, literature, and philosophy. His love of the classical languages was so great, that at the age of twenty he proposed a work intended to shew that they did not deserve eternal damnation for being pagans. In 1714, he was appointed a councillor of the parliament of Bordeaux, and two years after, president of the parliament. His first (published) work was his famous *Lettres Persanes* (Par. 1721), in which, the character of a Persian, he ridicules, with exquisite humour, and clear, sharp criticism, the religious, political, social, and literary life of his countrymen. Although he did not spare the Academy in these *Lettres*, he was admitted a member of it in 1728, and would have been admitted member, if Cardinal Fleury had not objected on the ground of his jests against religion. In 1726, M. de Montesquieu signed his office in the parliament of Bordeaux, and spent some years in foreign countries. In England, he spent two years, during which he was much in the company of Lord Chesterfield, and was treated with the greatest respect by the most distinguished personages. After his return to Brède, he published his *Considérations sur les Causes de la Grandeur et de la Décadence des Romains* (Par. 1748), a masterly view of Roman history, expressed in a sententious, oracular, and vigorous style. It was followed, after a long interval, by his *Dialogues de Sylla et de Lysimaque* (Par. 1748), published

under an assumed name, in which the motives and feelings of a despot are skilfully analysed. In the same year appeared his great work, on which he had been engaged for twenty years, the *Esprit des Lois* (2 vols. Geneva, 1748), in which it was attempted to exhibit the relation between the laws of different countries and their local and social circumstances. It was immensely popular. No fewer than twenty-two editions were published in eighteen months, and it was translated into various European languages. The *Esprit des Lois* is a wonderfully good book, considering the age in which it appeared. Without adopting Voltaire's hyper-eulogistic criticism, that 'when the human race had lost their charters, Montesquieu rediscovered and restored them,' it may be said that it was the first work in which the questions of civil liberty were ever treated in an enlightened and systematic manner, and to M., more than to any other man, is it owing that the science of politics has become a favourite subject of study with the educated public. M. died at Paris, 10th February 1755. The collective editions of his works are numerous, amongst which may be mentioned the recent complete and careful ones by Auger (8 vols. Par. 1819), by Destutt de Tracy and Villemain (8 vols. Par. 1827), and by Lefebvre (2 vols. Par. 1839).

**MONTÉ VIDEO**, SAN FELIPE DE, the capital of the republic of Uruguay, in South America, is situated on the north shore of the estuary of the Rio de la Plata (which is here 60 miles wide), and 132 miles east-by-south from Buenos Ayres. It stands on a small peninsula, and is surrounded by a wall and fortifications. The houses are mostly of one story, with flat roofs. The only public buildings worthy of notice are the cathedral and the town-hall. The climate is healthy; but, as there are no rivers near the town, water is scarce, and it is only obtainable from wells, or by collecting rain-water in cisterns. The bay or harbour, which is about 3½ miles long by 2 broad, presents excellent facilities for building wharfs, docks, &c., is sheltered from all but the south-west gales, and averages 16 or 17 feet in depth. The trade of M. V. is extensive; the exports consisting of wool, hides, hair, tallow, salt and dried beef, bones, &c.; and the imports, of cotton and woollen fabrics, hardware, also flour, wine, spirits, and other provisions. The chief trade is with Great Britain. M. V. has steam-communication with the United States, Rio Janeiro, Britain, and Genoa, and besides these, carries on a considerable trade with France, Spain, La Plata, and Italy. The population in 1862 (inclusive of the small suburbs of Cordon and Aguada) was 45,765, and in 1871, about 60,000. In 1871, 1502 vessels, of 739,607 tons, entered and cleared from the port. The imports for 1872 amounted to about £4,000,000; and the exports to about £3,350,000. For the history of M. V., see URUGUAY.

**MONTEZUMA**, the name of two of the emperors of Mexico.—M. I., the most able of the Mexican emperors, ascended the throne about 1437, and soon after, commenced a war with the neighbouring monarch of Chalco, which resulted in the annexation of that kingdom to Mexico. Tlatelolco, Cuixicas, and Tzompahuacan were next annexed. Some reverses which his arms now suffered, led to a confederacy of the Tlascalans and two other powerful tribes against him; but in the war which followed, M.'s arms were again signally triumphant, and the territories of the conquered tribes increased the domain of the now all-powerful Montezuma. After several other successful wars, he died in 1471.—M. II., the last of the Mexican emperors, before its subjugation by the Spaniards, succeeded to the

throne in 1502. He had distinguished himself as a warrior during the reign of his predecessor, and after his accession, carried the terror of his arms to the frontiers of Nicaragua and Honduras. He was at the same time a member of the priestly order, and did not demit his functions on his accession. He devoted his chief attention to the improvement of the laws, and of the internal administration, and displayed his taste for pomp and luxury by the magnificence of his household arrangements, and a profuse embellishment of his capital. This necessitated heavy taxation, which, combined with the strictness of his administration, led to continual revolts among his subjects, especially those who had lately come under his sway. When Cortes landed in Mexico with his small army in 1519, M., blinded by an old prophecy, and by the strange appearance of the invaders, acknowledged them as beings of a superior order, and as his masters (see CORTES). The inhabitants of Mexico having risen against Cortes, the latter caused M., who was then his prisoner, to appear in order to pacify them; but being wounded accidentally by a stone flung from amongst the crowd of his own subjects, he so keenly felt the indignities which he had suffered, that he repeatedly tore the dressing from his wound, and soon after died, June 30, 1520. Some of his children adopted the Christian religion, and his eldest son received from Charles V. the title of Count of Montezuma. One of his descendants was viceroy of Mexico from 1697 to 1701. His last descendant, Don Marsilio de Teruel, Count of Montezuma, was banished from Spain by Ferdinand VII., and afterwards from Mexico, on account of his liberal opinions, and died at New Orleans in 1836.

**MONTFERRAT**, formerly an independent duchy of Italy, between Piedmont, Milan, and Genoa, now forming part of the kingdom of Italy. It consisted of two separate portions, Casale and Acqui, lying between the Maritime Alps and the Po, and having an area of over 1300 square miles. The capital was Casale. M., after the downfall of the Frankish empire, was ruled by its own margraves till the beginning of the 14th century. This illustrious house for a long time disputed the sovereignty of Piedmont with the House of Savoy, and sent to the crusades more heroes than any other sovereign house in Europe. Members of the family ruled simultaneously in M., Thessaly, and Jerusalem. On the death of the Marquis John I. in 1305, his sister, Iolande or Irene, who was Empress of Constantinople, succeeded to M.; and her second son became the founder of the family of Montferrat-Paleologus, which became extinct in 1533, and M. passed to the Gonzagas of Mantua. In 1631, the dukes of Savoy obtained possession of a portion of M., and in 1703, with the consent of the German Emperor, the remaining portion passed under their sway, and was incorporated with their own dominions.

**MONTFORT**, the name of a noble French house, descended, according to the most probable opinion, from Baldwin, Count of Flanders, and Judith, daughter of Charles the Bald. AMAURI 2d, Seigneur de Montfort [a little town between Paris and Chartres] is the first of the family mentioned in history. He lived in the first half of the 11th century. His son, SIMON 1st, had for his third wife Agnes, daughter of Richard Comte d'Evreux. He left four sons, of whom only AMAURI 4th had issue. The grandson of this Amauri, SIMON 3d, surnamed the *Bald*, Comte de Montfort and Evreux, married Amicie, daughter of Robert de Beaumont, Earl of Leicester. His second son was the famous

SIMON 4th, Comte de Montfort, and Earl of Leicester, subsequently Comte de Toulouse. This nobleman, so conspicuous in the terrible crusade against the Albigenes (q. v.), was born about the year 1150. In 1198, he went to Palestine at the head of a troop of French knights, but failed in doing anything against the Saracens, and was obliged to return. In 1202, he joined the 4th crusade, which, however, had no religious design at all (see CRUSADES), in consequence of which M. abandoned it. In 1209, he took part in the war of extermination against the Albigenes. He signalled himself by his relentless ferocity, and his brilliant successes, but was killed by a stone at the siege of Toulouse, 25th June 1218.

**MONTFORT**, SIMON DE, Earl of Leicester, the fourth son of the preceding, was born in France about 1206. The title of Earl of Leicester came to him by his grandmother, Amicie de Beaumont, sister and heiress of Robert Earl of Leicester, but he did not directly or immediately inherit it, for, during the reign of King John, it was borne by Ranulf, Earl of Chester. Some time after the death of Ranulf, M. came to England, and offered his services to Henry III. Already he enjoyed a great reputation as a warrior, and Henry was so highly pleased with the young French noble, that he conferred on him the title of Earl of Leicester. Little did Henry think that the stranger was to prove against himself a great founder and champion of English constitutional liberty. He married Eliza, sister to King Henry III., and the youthful widow of that Earl of Pembroke to whom, more than to any other, the people of England owe Magna Charta. After this marriage—which was viewed with disfavour by the king—De M. became a steadfast advocate of the English Charter, and of the liberties of the people. After visiting the East, he was sent by the king to undertake the command of Gascony. In 1257, the king's debts were so great, and the rapacity of his foreign relations so unbearable, that the people were in a state of insurrection. The barons assembled, and, under the direction of De M., held the celebrated parliament at Oxford. They passed statutes to enforce the provisions of Magna Charta. The king swore to observe them, but sent forthwith to the pope praying to be absolved from his oath. The bull of absolution arrived. Henry set his barons at defiance, shut himself up in the Tower, and appealed to Louis of France. England was now in arms. The whole middle class looked up to De M. as their champion and leader, and the war began with the battle of Northampton. The wars of the barons, under De M., have been superficially viewed but as the result of turbulent nobles, who, in the absence of foreign warfare, employed themselves in getting up a contest at home. Later researches, however, have shewn that but for the struggles of De M. and the barons, the concessions at Runnymede would have been a mere worthless parchment. At Lewes, the royal forces were signally defeated, and the king taken captive. A French chronicler, who praises De M. as 'noble, chivalrous, and the ablest man of the age,' expressly adds that he was 'backed by the general favour of the people,' who at this time were so 'unspeakably trampled under foot, and deprived of all their liberties.' The conditions exacted from the king were, that he should observe Magna Charta and the Charter of the Forests; be moderate in his expenses and grants, until his old debts were paid off, and he was enabled to live on his own property, without oppression of merchants or the poor; and that Englishmen only should be chosen counsellors. No new pretensions were introduced, even at the

## MONTGOLFIER—MONTGOMERY.

moment of triumph, and the constitutional maxim of respecting the person of the king was carefully upheld. The queen (Elinor of Provence), who was in France, now occupied herself in collecting a large army. To deliberate upon the measures to be adopted at this great crisis, writs were issued to the sheriffs, in 1265, by De M., directing them to return two knights for each county, and two citizens or burgesses for every city and borough; and from this time may be clearly dated the recognition of the Commons as an estate of the realm in parliament. Guardians had been appointed by the barons to watch over the execution of Magna Charta, but fifty years of encroachment on the part of the crown, convinced De M. that a stronger and more enduring security would be to commit the care of constitutional freedom thenceforth to the people themselves, whose interests the barons thus identified with their own. Mr Blaauw, who, in his *Barons' War*, presents De M. almost for the first time in his true character, adds, that 'it should be an honest pride to us in after-times that English liberty thus owes its birth to the noblest parentage, confidence in the people.' A second war broke out, and this time the popular cause was weakened by defection and treachery. Prince Edward (afterwards Edward I.) encountered the barons at Evesham, with a greatly superior army. When defeat was inevitable, the great leader refused to flee. He 'fought stoutly like a giant for the liberties of England,' but fell, overwhelmed by numbers. 'Thus lamentably (says an old chronicler) fell the flower of all knighthood.' The death of De M. filled the whole land with mourning. Like Cromwell, whose career in many respects resembles his own, he was denied a grave by the royalists, his head being sent to Wigmore Castle, and his mutilated limbs to different towns; but the people bewailed their dead champion, and the clergy who adhered to the popular side, pointed to his glorified spirit in heaven. The influence of De M. was felt after his death. A baron was executed for bearing arms against the sovereign, and although the Oxford Statutes were formally rescinded, their spirit remained.

**MONTGOLFIER, JACQUES ETIENNE** and **JOSEPH MICHAEL**, two brothers, distinguished as the inventors of the first kind of Balloons (q. v.). They were the sons of a celebrated paper-manufacturer at Annonay, in the department of Ardèche, and early engaged themselves in the same branch of industry. Etienne, after a few successful experiments with the balloon, repaired to Paris; but though his discovery created a great sensation, and was followed out in practice by many eminent men, he obtained little pecuniary aid in carrying on his experiments, and at length retired to his native town, where he resumed the manufacture of paper, and died at Verrieres, in 1799.—His elder brother, Joseph, the harer of his labours and his glory, was a man of such genius and little education; but the two brothers were fitted to supplement each other's deficiencies, and together they made many discoveries, and were both received as members of the French Academy. Joseph invented the hydraulic crew, the calorimeter, &c., and in the latter part of his life, filled a post in the department of Arts and Manufactures. He died at Paris in 1810.

**MONTGOMERY, GABRIEL**, COMTE DE, a French knight of Scottish extraction, and an officer in the Scottish Lifeguard of the king of France, was born about 1530. At a tournament given, 30th June 1559, by Henry II. in honour of his daughter's marriage with Philip of Spain, the king insisted upon young G. entering the lists with him. M. reluctantly complied, and the shaft of his broken lance entering the

king's visor at the eye, Henry II. was borne insensible from the ground, and so continued for eleven days, when he died. M., although blameless, left France, and soon after embraced Protestantism in England. On the commencement of the religious wars in 1562, he returned to his native country to support the Protestant cause, and defended Rouen with great bravery. In the third religious war, he was one of the leaders of the Protestants, and gained many advantages over the royalists in Languedoc and Béarn. During the massacre of St Bartholomew, he happened to be at Paris, and owed his escape to the swiftness of his horse, and fled to England. In April 1573, he appeared off Rochelle with a small fleet, but failed in accomplishing anything, and was obliged to retire. Next year, at the head of a band of Huguenots, he landed in Normandy, and commenced war there; but being compelled at last to surrender the castle of Domfront, he was carried to Paris; and although the general to whom he surrendered had assured him of his life, he was beheaded, after long imprisonment, 27th May 1574. Brantome describes him as naturally the most nonchalant and pleasure-loving of men, but that, when once he had mounted his saddle, there was not a more daring or vigilant warrior in all Christendom.

**MONTGOMERY, JAMES**, a minor British poet, the son of a Moravian preacher, was born at Irvine, Ayrshire, November 4, 1771, and at the age of seven was sent to the Moravian settlement at Fulneck, near Leeds, in order to complete his education for the Moravian pastorate. At Fulneck, the course of study seems to have been too severe in its character for the young poet; the imaginative side of his mind was allowed no recognition, and it was only by stealth that he read Cowper's poems and *Robinson Crusoe*. Much of his leisure time at school was employed in the composition of verses and of music, in which he took much delight. In 1789, he ran away, and, after four years of various employment, became engaged as clerk to Mr Gales, editor of *The Sheffield Register*, for which he soon began to write political articles. In 1794, he commenced a newspaper of his own, *The Sheffield Iris*, which he continued to edit till 1825, when he retired. During the period of his editorship, M. was twice subjected to fine and imprisonment, by government. In 1795, he was fined £20, and sentenced to three months' imprisonment, for printing off some copies of a miserable ballad in which government suspected that sedition lurked, and in 1796, he was fined £30, and imprisoned for six months, for giving an account of a Sheffield riot. He received a government pension of £150 in 1835, and he died at his own house in Sheffield, April 30, 1854. His principal works are—*The Wanderer of Switzerland* (1806); *The West Indies* (1809); *The World before the Flood* (1812); and *The Pelican Island, and other Poems* (1827). A collected edition of his minor poems appeared in 1851; and in 1853, his *Original Hymns for Public, Private, and Social Devotion*, closed the series of his publications.

His poems are melodious, full of picturesque description, and the gentlest human feeling. The personages introduced in his poems are, however, only shadows, or touched with the faintest colour of character. But he claims a well-defined position among the favourite poets of his country by several of his hymns and minor poems, and by his exquisite verses on Home, which commence the third part of *The West Indies*.

**MONTGOMERY, ROBERT**, a preacher and verse-maker, who has gained notoriety, if not fame, was born at Bath in 1807. He graduated B.A. at Oxford in 1833, M.A. in 1838, and was ordained in

# MONTGOMERY—MONTI.

1835. In 1836, he became minister of Percy Street Episcopal Chapel, London: he afterwards removed to Glasgow, where he preached for four years, but returned to London, and resumed office at Percy Street Chapel in 1843. He died December 3, 1855. M.'s works comprise a large number of volumes in prose and verse, on themes more or less sacred. He is best known by his poems. *The Omnipresence of the Deity* (1828) has passed through 26 editions. But his celebrity may be said to have died with him, and his works have already become part of the lumber of libraries. This result has been brought about to some extent by the judgment which Macaulay passed upon *The Omnipresence* and other works by this author.

**MONTGOMERY**, a city and the capital of Alabama, United States, is on the left bank of the Alabama River, 415 miles above Mobile, at the head of steam-boat navigation. The city is very handsomely built, with elegant residences and gardens on a cluster of hills, on one of which is a handsome state-house. It has a law-school, several academies, 6 churches, 2 banks, 4 daily papers, marble-works, iron-foundries, and is one of the largest cotton-marts in the state. M. is connected by railways with Pensacola, Florida, and Atlanta, Georgia. It became, in 1860, the capital of the Confederate States, and continued to be the seat of government until, on the secession of Virginia, it was removed to Richmond. Pop. in 1870, 10,588.

**MONTGOMERYSHIRE**, an inland county of North Wales, between Shropshire on the E., and the Welsh counties, Merioneth and Cardigan, on the W. Area, 483,323 statute acres, of which only about 80,000 are under tillage; pop. (1871) 67,623. The surface is almost wholly mountainous, a large portion consisting of bleak elevated moorlands; but toward the English border, there are several warm, fertile, and well-wooded valleys. The Severn, the Vyrnwy, and the Dovey are the principal rivers. The county belongs almost entirely to the basin of the Severn. The mineral wealth of M. is not great, but copper, lead, and zinc are procured, and millstones, slates, and limestone are quarried. On the uplands, the soil is poor, and suited principally for mountain pasture; but in the valleys, grain and flax are raised. Cattle and sheep, and the pure breed of Welsh ponies called 'Merlins,' are reared. The Welsh-flannel manufacture is extensively carried on in the county. The capital is Montgomery; pop. (1871) 1285, from which the county received its name, and which was so called from Roger de Montgomery, Earl of Arundel and Shrewsbury, who, in 1093, recaptured the town and castle which had been wrested during the previous year by the Welsh from the founder, Baldwin, lieutenant of the Marches to William the Conqueror and William Rufus. The county sends one member to the House of Commons. The county business is carried on at Welshpool and Newtown alternately. There is an excellent trade in cattle and horses. Offa's Dyke traverses the south-east corner.

**MONTH**, originally the period of the moon's revolution round the earth. If this is reckoned from the position of the moon among the stars to her return to the same position, the period is called a *sidereal* month, and consists of 27 days, 7 hours, 43 minutes, 11½ seconds; but if from new moon to new moon, it is longer, being 29 days, 12 hours, 44 minutes, 3 seconds; this is called a *synodic* month (see Moon). The latter period forms one of the three natural measures of the lapse of time, and, notwithstanding that its efficiency depends on the state of the atmosphere, it ranks next to the day in importance. There are several other periods used

by astronomers to which this name is applied: the *tropical* or *periodic* month (27 days, 7 hours, 43 minutes, 47 seconds), reckoned from the passing the equinox till her return to the point; the *nodal* month (27 days, 5 hours, 41 minutes, 29 seconds), from ascending node to ascending node; the *anomalistic* month (27 days, 13 hours, 18 minutes, 37 seconds), from perigee to perigee; and the *solar* month, which is the part of a solar year, consisting of 30 days, 10 hours, 29 minutes, and 4 seconds. Distinct from all these is the *civil* or *calendar* month, fixed by law for ordinary purposes, and consisting of a fixed number of days—from 28 to 31—according to the particular month. The calendar months, with the number of days belonging to each, are as follow:

	Days.		Days.
1. January, . . .	31	7. July, . . .	31
2. February, . . .	28	8. August, . . .	31
" (leap years) . . .	29	9. September, . . .	30
3. March, . . .	31	10. October, . . .	31
4. April, . . .	30	11. November, . . .	30
5. May, . . .	31	12. December, . . .	31
6. June, . . .	30		

See also the separate months under their own heads. The names by which the months are designated throughout Christendom were given them by the Romans; and though Charlemagne in the 8th c., and the French Directory in the end of last century, attempted to substitute descriptive epithets, the old-established names continue to be preferred.

**MONTHOLON**, CHARLES TRISTAN DE, Count afterwards *Marquis de*, descended from an ancient French family, was born at Paris, 1782. At the age of ten he entered the navy, but exchanged it for the army in 1798. His rise was rapid. He displayed great zeal on behalf of the First Consul in the revolution of 18th Brumaire, in the capacity of *chef d'escadron*. He served in a number of campaigns, and was severely wounded at Wagram. Napoleon made him his chamberlain in 1806. He was made a general of brigade in 1814, and appointed to the chief command in the department of Lorraine. On Napoleon's abdication, M. remained in France, but held aloof from the Bourbons. No sooner had the Emperor escaped from Elba and landed at Frejus, than M. hastened to join him. He was present at Waterloo, and accompanied Napoleon to St Helena, continuing his devoted attention to him till he breathed his last, and being named in his will as one of his trustees, spared no exertion to carry its provisions into effect. Along with General Gourgaud, he published *Mémoires pour servir à l'Histoire de France sous Napoléon, écrits à Ste.-Hélène sous sa dictée* (8 vols. Par. 1824). He afterwards published a work entitled *Esquisse de la Captivité de Ste.-Hélène* (Lond. 1847). In the proclamations which Louis Napoleon issued on his landing at Boulogne in 1840, M. was named chief of his staff, and on this account he was condemned by the Chamber of Peers to 20 years' imprisonment; but he was afterwards pardoned. He died 31st August 1853.

**MONTI**, VINCENZO, the great regenerator of modern Italian poetry, was born 19th February, 1753, in the Roman province of Ferrara, and studied in the university of Ferrara. On the termination of his studies, he repaired to Rome (1778), where the patronage of friends obtained for him the post of secretary to the pope's nephew. During his abode in Rome, he became involved in a bitter squabble with Alfieri, whose fame as the master-tragedian of Italy was then high in the ascendant—a fact which may have been unpalatable to M., in consequence of the failure of his own dramatic attempts. The assassination of Basville, the republican envoy at

France, afforded to M. a subject for his poem, *La Basvilliana*. His two succeeding poems, the *Musonia* and the *Feroniade*, contained the bitterest invectives against France and Bonaparte; but on the appearance of a French army before Rome, M., with the inexcusable inconsistency which characterised his political conduct throughout, hastened to espouse the cause of France, and to invoke the protection of Bonaparte. M. was shortly after appointed secretary of the Cisalpine Directory; and in 1789 repaired to France, where he undertook the translation of Voltaire's poetical works. On returning to Italy, he was appointed professor in the university of Pavia; and in 1805, on Bonaparte being proclaimed king of Italy, M. was appointed state historiographer. On the fall of the Empire, M. became the eulogist of the Austrian possessors of his country. In the midst of all these political vicissitudes, he pursued with vigour his studies of the classics, and accomplished one of his greatest works, the translation of the *Iliad* into Italian verse. M. died at Milan, 13th October 1828, of an apoplectic stroke, and was sincerely lamented, notwithstanding the many opponents his hasty susceptibility had created in life. The best editions of his works are those of Milan (1825—1827, 8 vols.), and his *Opere Inedite e Rare* (Milan, 1832—1833, 5 vols.). M. had a warm admiration of Dante, and partook, in some degree, of the spirit of the great master. His chief works are distinguished by sustained grandeur of imagery and diction, by daring flights of imagination, and by the delicacy, elevation, and fire of the sentiments expressed. They are too numerous for separate notice, but the best of them rank among the noblest productions of Italian genius.

**MONTILLA**, a town of Spain, in the modern province of Cordova, and 20 miles south-south-east of the city of that name. It stands on a hillside rising from the south bank of a tributary of the Genil. Manufactures of coarse linen and earthenware are carried on, and oil-mills are in operation. A famous wine is grown in the vicinity. M. is the birthplace of Gonzalo de Cordova, the 'Great Captain.' Pop. 15,000.

**MONTJOIE ST DENIS**, the war-cry of the old kings of France, said to be as ancient as the days of Clovis, and from which the king-of-arms, Montjoie, who had exclusive jurisdiction in France, derived his title.

**MONTLUÇON**, a town of France, department of Allier, is picturesquely situated on a hill on the right bank of the Cher, 40 miles west-south-west of Moulins. It has some coarse cloth manufactures, and trade in corn, wine, and fruits. It has also iron-works and plate-glass manufactories. Pop. 11,247. At a distance of 10 miles are the wells of Nérès-les-Bains, celebrated in the time of the Romans—of whom many traces are left—and still much frequented by invalids.

**MONTMARTRE**. See PARIS.

**MONTMORENCY**, ANNE, first DUC DE, Marshal and Constable of France, born March 1493, belonged to one of the oldest and greatest of the noble families of France. He received, it is said, the name of Anne from his godmother, Anne of Brittany. He distinguished himself by his gallantry and military skill in the wars between Francis I. and the Emperor Charles V., and was taken prisoner along with his sovereign in the battle of Pavia, which was fought against his advice. He afterwards became the leader of the French government, showing great ability in matters of finance and diplomacy, and was made Constable in 1538; but his rough manners made him an object of dislike to

many; and the suspicions of the king having been aroused against him, he was suddenly banished from court in 1541, and passed ten years on his estates, till the accession of Henry II., when he came again to the head of affairs. In 1557, he commanded the French army which suffered the terrible defeat of St Quentin, in which he was taken prisoner. During the minority of Charles IX., M., with the Duke of Guise and the Marshal St André, composed the famous triumvirate which resisted Catharine de' Medici. In 1562 and 1567, he commanded the royal army against the Huguenots, and in both wars gained victories over them, but received a fatal wound at St Denis, and died at Paris on the following day, 12th November 1567.

**MONTMORENCY**, HENRI, second DUC DE, grandson of the famous Constable de Montmorency, born at Chantilly, 30th April 1595. His godfather was the great *Henri Quatre*, who always called him his 'son.' When he was 17 years of age, Louis XIII. made him Admiral, and he defeated the Huguenots in Languedoc, and took the Isle of Ré from those of Rochelle. He afterwards gained other victories over them, and in 1630 received the chief command of the French troops in Piedmont, where he defeated the Spaniards, for which he received a marshal's baton. Unhappily for himself he ventured to oppose Richelieu, who had always been his enemy, and espoused the cause of Gaston, Duke of Orleans; for this he was declared guilty of high treason, and Marshal Schomberg being sent against him, defeated him at Castelnaudary, and took him prisoner. M., although almost mortally wounded, was carried to Toulouse, sentenced to death by the parliament, and notwithstanding his expressions of penitence, and the most powerful intercession made for him—for example, by King Charles I. of England, the pope, the Venetian Republic, and the Duke of Savoy—was beheaded, 30th October 1632. M. was distinguished for his amiability and the courtesy of his manners, as well as for his valour.

**MONTORO**, a town in the southern province of Avellino, built partly on the slope and partly around the base of a hill, 12 miles north of Salerno. Pop. 4721. It forms the central point of several villages, and has large markets and some linen and cloth manufactures.

**MONTORO**, a pleasant town of Spain, in the modern province of Cordova, built on a rocky ridge around which winds the Guadalquivir, 26 miles east-north-east of Cordova. It contains one of the best hospitals in Andalusia. Hardly any drinkable water can be obtained within the town. The heights in the vicinity are clothed with olive plantations, and oil is largely exported from this quarter. Woollens and earthenware are manufactured. Pop. 10,500.

**MONTPELIER**, the capital of Vermont, United States of America, is on the Winooski River, 215 miles north-north-west of Boston. It is a picturesque village, with a handsome state-house, 5 churches, 3 banks, 5 newspapers, iron-foundry, flour-mills, and manufactures of carriages, hats, lumber, &c. Pop. (1870) 3023.

**MONTPELLIER** (Lat. *Mons pessulanus* or *puellarum*), a city of France, in the department of Hérault, in 43° 36' N. lat., and 3° 50' E. long. Pop. (1872) of the town alone, 57,727. Seen from a distance, M. has an imposing appearance, from the number of its towers, steeples, and cupolas; but although its suburbs are clean and well built, the interior of the old town disappoints expectation, being chiefly remarkable for its crooked, dark, narrow, and dirty streets. The public walks, known as those of the Peyrou, and some of

# MONTPELLIER—MONTREAL.

the other more elevated points, afford glorious views, embracing the Mediterranean, the Alps, the Cevennes, and the Pyrenees. The most noteworthy buildings are the cathedral, the theatre, the exchange, the Hall of Justice, the prefecture, the observatory, and the university. The last, which was founded in 1196, is composed of three faculties—that of medicine, founded in the 12th c. by Arabian physicians, and still ranking among the best in Europe—that of the exact, and that of the physical sciences. M. has a botanical garden, the oldest in Europe; a public library of 50,000 volumes, and a pharmaceutical school; admirable museums, natural history and fine art collections, &c. The industrial products of M. are pigments and other chemical preparations, brandy, liqueurs, perfumes, soap, corks, sugar, cotton, woollen, and fine leather goods; and the trade, which is very important, includes, besides these articles, wine, seeds, olive-oil, and fruits. Railways to Marseille, Cette, and other ports, besides various canals, facilitate commercial and social intercourse, and few cities of the empire hold out greater attractions in regard to intellectual culture than Montpellier. Its geographical position has led to its being selected as a place of residence for consumptive patients; but the extreme clearness, and even sharpness of the air in the more elevated parts of the town, the occasional occurrence of the icy wind known as the *Mistral*, and the sudden accession of overpowering heats, would seem very materially to counteract some of its long reputed advantages.

MONTREAL, the largest city of Lower Canada and of British America, lies in lat. 45° 31' N., long. 73° 35' W., on the left bank of the St Lawrence, 180 miles above Quebec, and 200 below Lake Ontario, 400 from New York, and 2750 from Liverpool. Its eastern suburb, which is now an incorporated village, called Hochelaga, was originally the site of an Indian village of the same name, discovered in September 1535 by Jacques Cartier; and it is from his admiring exclamation at the view obtained from the neighbouring hill, that M. (corrupted from *Mont Royal*) derives its name. The westernmost permanent settlement which the French obtained in Canada, it was under them merely an outpost of Quebec, and continued to be such under British rule till 1832, when it became a separate port. Since then, the rapidity of its progress has been astonishing. By the deepening of the shallower parts of the river above Quebec, M. is now accessible to vessels of over 3000 tons burden, and drawing from 19 to 22 feet. Its harbour, lined with wharfs for a mile and a quarter, at which 125 ships could lie at one time, is, from its inland position (90 miles above the influence of the tides), perfectly safe. Situated at the head of the ocean-navigation of the St Lawrence, M. has naturally become the *dépôt* for the exports and imports of all the Canadas. At the same time, the obstruction to vessels sailing further up the river, caused by the rapids, has been surmounted by magnificent canals. The canals connecting M. with Lake Ontario have locks of 200 feet by 45, with 9 feet of water on the sills; the locks of the Welland Canal are rather smaller. As M. lies also near the confluence of the Ottawa and St Lawrence, it is in immediate connection with the vast lumber-country adjoining the former river and its tributaries; while a canal has been projected to connect the Ottawa, through Lake Nipissing, with the Georgian Bay in Lake Huron, which, if carried out, will probably bring the produce of the north-western states, as well as of Western Canada, through M., as it would give them an outlet to the ocean between 200 and 300 miles shorter than by the

Erie Canal. But even at present, while navigation is open, an extensive daily traffic is carried on, by steamers and sailing-vessels of every description, with Lake Ontario and the Ottawa district, as well as with the Lower St Lawrence; and the ships of the Montreal Ocean Steam-ship Company, by aid of a subsidy from the Canadian government, keep up a weekly communication with Liverpool, while at the same time the harbour is constantly crowded with vessels from other foreign ports. After the navigation of the St Lawrence is closed, the coast-steamers find a harbour at Portland, Maine, which is connected with M. by a railway of 292 miles. This line belongs to the Grand Trunk Railway Company, and crosses the St Lawrence at M. by the celebrated tubular Victoria Bridge, the length of which, including its two abutments and 24 piers, is above a mile and three-quarters. By the lines of the same company, M. has railway communication with Upper Canada and the western states, and with Lower Canada as far eastwards as Rivière du Loup, in the Gulf of St Lawrence. Several other lines afford direct communication with all the important cities and towns in New York state and the states of New England. The position, therefore, of M. as a centre of commerce is perhaps unequalled, and its rapid advance in consequence has placed it, within the last few years, among the first commercial cities of the American continent—second perhaps only to New York. In exports, imports, and duties collected during the four years previous to 1862 were as follows: 1858—exports, £684,588; imports, £2,450,815; duty collected, £334,768. 1859—exports, £608,952; imports, £3,110,714; duty collected, £467,248. 1860—exports, £1,204,143; imports, £3,066,802; duty collected, £490,770. 1861—exports, £2,083,147; imports, £3,239,515; duty collected, £478,695. For the year ending June 30, 1870, these items had attained the following greatly increased proportions: Exports, £3,979,252; imports, £5,350,169; duty collected, £860,000. The value of assessed property by the latest returns is £9,933,125; in 1857 it was only £4,609,097. The population has risen in like manner. In 1840, it was about 27,297; in 1852 it was 57,716; in 1854, about 65,000; in 1861, 90,333; and in 1870, 160,000. The number of sea-going vessels arriving in the port of M. in 1870 was 80; in 1856, the number of sea-going vessels was only 232; a very considerable increase being thus shown. The harbour is open on an average about eight months, from the latter half of April to the beginning of December.

The most conspicuous building in M., which is perhaps also the finest church on the continent of America, is the Roman Catholic cathedral. Built in the Gothic style of the 13th century, it comprises seven chapels and nine aisles, and can accommodate between 6000 and 7000 people. It has six towers, of which the three on the main front are 220 feet in height; and its chief window is 64 feet high, and 32 broad. There are several other Roman Catholic churches belonging to the order of St Sulpice, to whose members chiefly M. owes its foundation, and who still hold the seignior of the island on which the city is built. Adjoining the cathedral, is the seminary of St Sulpice, to which a large addition has been built within the last few years at a cost of £8000. The city contains also some of the largest conventual establishments in the world. The general wealth, indeed, of the Roman Catholic Church in M. has grown enormous in consequence of the increased value of the property given to it during the early settlements of the French. The Church of England has recently erected, at an expense of above £20,000,

## MONTREAL—MONTROSE.

a new cathedral, which is very chaste in style, though somewhat small for a metropolitan see. St Andrew's Church, the most important belonging to the Church of Scotland, is also a very chaste specimen of Gothic architecture, and cost about £10,000. At about the same cost, the Methodists have built a handsome church in the florid Gothic style. Besides the Roman Catholic college in College Street, St Mary's College of the Jesuits, and a Baptist college, M. possesses an important university under the name of McGill College. Founded by a bequest of the Hon. James McGill in 1811, erected into a university by royal charter in 1821, and reorganised by an amended charter in 1852, it has now, besides its principal, the distinguished naturalist, Dr Dawson, a staff of 29 professors, and has an attendance of upwards of 300 students. M. is supplied with water by magnificent works, which cost about £120,000. The water is brought from the St Lawrence above the Lachine Rapids by an aqueduct five miles long to a pond, from which it is forced up by power derived from part of its surplus waters into reservoirs capable of containing 20 millions of gallons, and situated 200 feet above the level of the river. Along the side of the 'Mountain,' there is a line of mansions, which command the view that astonished J. Cartier, and which may compare with the suburban mansions of the wealthiest cities in Europe or America. M. returns three members to the provincial parliament.

**MONTREAL**, the large and fertile island on which the city of the same name is built, is 30 miles long, 10 miles at its greatest breadth, and contains 97 square miles. Formed by the separation of the two channels by which the Ottawa issues into the St. Lawrence, its surface, except at Mount Royal, is really diversified by gentle undulations, which run from north-east to south-west, and are named *Potomac*. The island forms a county, divided into two ridings, the East, or *Hochelaga*, and the West, or *Jacques Cartier*, each of which returns a member to the provincial parliament.

**MONTROSE**, a royal and parliamentary burgh and seaport on the north-east coast of Scotland, in the county of Forfar, and situated at the mouth of the river South Esk, about 80 miles north-east of Edinburgh, and 40 miles south of Aberdeen. It stands on a level peninsula between the basin of the Esk (an expanse 7 miles in circumference, and dry at low water) and the mouth of the river. A fine suspension-bridge, 432 feet long and 26 feet broad—erected in 1828—1829 at a cost of nearly £20,000—connects the town with Rossie Island, which is again connected with the mainland by a small draw-bridge. The Royal Lunatic Asylum, opened in 1868 at a cost of upwards of £30,000, accommodates about 400 patients. Between the town and the shore are the 'Links' or downs, among the finest in Scotland for golfing or cricketing. The harbour affords excellent accommodation to vessels of large tonnage, there being 18 feet of water on the bar at low-water of spring-tides, and is one of the best on the east coast. Two lighthouses stand in a line on the north bank of the river, about 400 yards apart; while a magnificent tower, named the Scurdyness Lighthouse, erected by the Board of Trade in 1870 at a cost of nearly £2700—exhibiting a clear white light, visible at nearly 20 miles distance—stands at the mouth of the river. Flax-spinning is the chief manufacture in the town, there being 4 factories of about 500 horse-power in the aggregate, employing upwards of 2000 hands, at a weekly cost of about £1500. There is also a large saw-mill, giving employment to nearly 300 men and boys. Ship and boat building, formerly a staple trade of the town,

has greatly fallen off. Education is well represented in the town—the chief institution being the academy. In 1873, 1234 vessels, of 173,640 tons, entered and cleared the port. The imports are coal, lime, slate, iron, flax, and manures; the exports, manufactured goods, salmon, herring, dressed wood, and agricultural produce. Pop. (1871) 15,720. M. unites with Arbroath, Brechin, Forfar, and Bervie to send a member to parliament.

**MONTROSE**, JAMES GRAHAM, first MARQUIS OF, belonged to a family that can be traced back to the year 1128. Its first notable member was SIR JOHN GRAEME of Dundaff, who fell at the battle of Falkirk, 22d July 1298. Early in the 15th c., Sir William Graham married for his second wife a daughter of Robert III. ROBERT, the eldest son of this marriage, was ancestor of the Grahams of Claverhouse. The third Lord Graham, created Earl of Montrose by James IV., fell at Flodden; his eldest son at Pinkie. The next in succession became viceroy of Scotland after James VI. had ascended the throne of England. His eldest son, John, who succeeded to the earldom in 1616, married Lady Margaret Ruthven, eldest daughter of William, first Earl of Gowrie, and sister of the unfortunate nobleman who gives name to the *Gowrie Conspiracy*. The issue of this union was five daughters and one son, James, the 'great Marquis,' who was born in 1612, according to tradition, in the town of Montrose. His mother died in 1618, his father in 1626. In the following year, the boy was sent to the university of St Andrews by his guardian and brother-in-law, Archibald, Lord Napier, son of the famous inventor of logarithms. He was an apt, if not an ardent student, and during the two or three sessions of his attendance at college, acquired a very respectable amount of classical knowledge, besides exhibiting a genuine predilection for literature, which the stormy character of his after-life never quite destroyed. In his 17th year, he married Magdalene Carnegie, daughter of Lord Carnegie of Kinnaird, on which occasion he had his portrait painted by Jameson, the pupil of Van Dyck. For the next three years he lived quietly at Kinnaird Castle, pursuing his studies. On attaining his majority, he left Scotland, to travel on the continent, visited the academies of France and Italy, and perfected himself in all the accomplishments becoming a gentleman and a soldier. On his return, he was introduced to King Charles I., but owing, it is said, to the machinations of the Marquis of Hamilton, was coldly received by that monarch, and had no sooner reached Scotland, than he joined the ranks of the king's opponents, which at this period comprehended the majority of Scotchmen. M. came back in the very year (1637) when the tumults broke out in Edinburgh on the attempt to introduce the Prayer-Book. Whether his conduct at this moment was the result of chagrin, or whether he was carried away by the prevailing enthusiasm, or by the persuasions of craftier persons than himself, is difficult to say. Baillie speaks of his having been 'brought in' by 'the canniness of Rothes,' a phrase which appears to Mr Mark Napier to indicate that he was trepanned with difficulty into joining the League. At any rate, the youthful nobleman soon became to appearance one of the most zealous of the Covenanting lords. He was one of the four noblemen selected to compose the 'Table' of the nobility, which, along with the other Tables of the gentry, of the burghs, and of the ministers, drew up the famous National Covenant (see COVENANTS), sworn to by all ranks at Edinburgh in the spring of 1638. M. was appointed in the following summer to agitate for subscriptions

he honourably resisted the importunities of the zealots among the Presbyterian clergy, who wished to expose it to the horrors of conflagration. Baillie again complains of his 'too great lenity in sparing the enemy's houses.' The arrival at Aberdeen by sea of the Earl of Aboyne—Charles's lieutenant of the north—with some reinforcements, induced M. to retreat, who was followed by the earl and the Gordon Highlanders. At Meagra Hill, near Stonehaven, a battle was fought (15th June) between the two armies, in which M. obtained a complete victory; four days later, he was again master of Aberdeen, after a fierce struggle at the passage of the Dee. The citizens were stricken with alarm, expecting some bloody punishment for their well-known Episcopalian leanings, but M. agreeably disappointed their fears. At a subsequent period, he was upbraided by the Committee of Estates for not having burned the town on this occasion. News of 'the pacification of Berwick' now arrived in Aberdeen, and terminated the struggle in the north. Charles invited several of the Covenanting nobles to meet him at Berwick, where he was then holding his court, and to consult with him about Scottish affairs. Among those who went was M., and the Presbyterians dated what they regarded as his apostasy from that interview. Be that as it may, his political position was certainly different after his return. In the General Assembly which met, August 13, 1639, under the presidency of the Earl of Traquair, as royal commissioner, he shewed symptoms of disaffection towards the Covenant, and was the object of much popular obloquy. One night he is said to have found affixed upon his chamber-door a paper bearing these words, *Invictus armis, verbis vincitur*. The dissolution of the parliament, in June 1640, led to an open rupture between the king and the Covenanters, and both parties prepared to decide their quarrel by force of arms. The former assembled at York an army of 21,000 horse and foot; the latter another of 26,000, which, under the command of Leslie, crossed the Tweed, 21st August 1640. M. was the first man that forded the stream. The successes of the Scots, as is well known, soon forced Charles to summon a new parliament for the settlement of the national grievances. Meanwhile M., along with several other influential nobles, had

war in England had now broken out, carried on with dubious success. C. advisers resolved to crush the Presb in Scotland, who were abetting the English Parliamentarians. In the s M., now raised to the rank of marqu where he had been residing with, and proceeded to Scotland to raise in the north. The battle of Marston moment paralysed him, but his reso returned. He threw himself into t and after skulking about the hills fe disguise, met at Blair-Athol some B and a body of Highlanders under Al Keitache Macdonald, better known a had forced their way thither from Isles in hopes of joining him. M. i himself at their head, and the clans round his standard. Marching s suddenly (1st September) on the Cov commanded by Lord Elcho, at Ty Perth, and gained a complete vi single royalist was slain. The sa entered Perth, where he remained f levying a fine of 9000 merks on th He then set out for the north, defe Covenanters under Lord Burleigh (September 13), and took possession which was abandoned for four da horrors of war. The approach of a head of 4000 men, compelled M., wh far inferior in numbers and discipl He now plunged into the wilds recrossed the Grampians, and sudden Angus, where he wasted the estates one Covenanting nobleman. Having supplies, he once more returned to with the view of raising the Gorn escaped defeat at Fyvie in the end c again withdrew into the fastnesses of Argyle, baffled in all his attempts crush M., returned to Edinburgh, an commission. His opponent, receiv sions from the Highland clans, pl campaign, marched south-westward i of the Campbells, devastated it fri Argyle himself from his castle at In wheeled north, intending to attack B

## MONTERRAT—MONZA.

antly turned on his pursuer, fell upon him expectedly at Inverlochy, February 2, 1645, and early routed his forces. Fifteen hundred of the rebels were slain, and only four of M.'s men. He then resumed his march northwards, but did not venture to assault Inverness—his wild mountaineers being admirably fitted for rapid irregular warfare, not for the slow work of beleaguering. Directing his course to the east, he passed—with fire and sword—through Elgin and Banff into Aberdeenshire, which suffered a similar fate. Baillie, and his lieutenant, Hurry, were at Brechin, but M., by a circuitous movement, eluded them, captured and sacked the city of Dundee (April 3), and escaped easily into the Grampians. On the 9th of May, he attacked and routed Hurry at Auldearn, near Nairn; and after enjoying a short respite with his fierce warriors in Badenoch, again issued from his wilds, and effected a still more disastrous defeat on Baillie himself at Alford, in Aberdeenshire (July 2). There was now nothing to prevent his march north, and about the end of the month, he set out with a force of from 5000 to 6000 men. He was followed by Baillie, who picked up reinforcements on his way, and on the 15th of August again risked a battle at Kilsyth, but was routed with frightful loss—6000 of the Covenanters being slain. The cause of Charles was for the moment triumphant; M. was virtually master of the country. The king formally appointed him lieutenant-governor of Scotland, and commander-in-chief of the royal forces. All the principal cities of the west hastened to proclaim their fidelity, and laid the blame of the recent troubles on the unfortunate Presbyterian clergy. But affairs soon took every different turn. Great numbers of the Highlanders returned home—we might even say, deserted—burdened with multifarious plunder; and the Earl of Aboyne withdrew with all his cavalry. M.'s position in a district teeming with enemies, was becoming critical, and on the 4th of September he broke up his camp at Bothwell, and marched for the eastern counties, where Charles had informed him that the Earls of Traquair, Home, and Roxburgh were ready to join him. In this he was disappointed, and on the 13th of the same month he was surprised at Philiphaugh, near Selkirk, by David Leslie, who fell upon the relics of M.'s army and his raw levies with 6000 cavalry—the remainder of the Scottish forces then serving in Flanders—who had been hurriedly despatched on the news of M.'s startling successes. Leslie completely annihilated his opponent. 'On Philiphaugh,' says Sir W. Scott, 'M. lost the fruit of his splendid victories.' Escaping from the field of battle, he made his way to Athol, and again endeavored, but in vain, to rouse the Highlands; and at last Charles, now beginning to get the worst of the civil war, was induced to order him to withdraw from the kingdom. On the 3d of September 1646, he sailed for Norway, whence he proceeded to Paris. Here he endeavored, but in vain, to induce Henrietta Maria to bestir herself on behalf of her husband. The queen coldly received his suggestions, and at last M., in despair, betook himself to Germany, in hope of service under the Emperor, but soon after returned to Holland, and entered into communications with the Prince of Orange, afterwards Charles II. It was here that news of Charles I.'s execution reached him. M. died on receipt of the dreadful intelligence, and the way to the most passionate regrets. Charles now re-invested him with the dignity of lieutenant-governor of Scotland, and M. undertook a hazardous invasion on behalf of the exiled monarch. In March 1650, he arrived at the Orkneys with

a small force, and after the lapse of three weeks, proceeded to Caithness; but neither the gentlemen nor the commons would rise at his call. He forced his way as far south as the borders of Ross-shire, where his dispirited troops were attacked and cut to pieces at a place called Corbisdale, near the pass of Invercarron, by a powerful body of cavalry under Colonel Strachan. M. fled into the wilds of Assynt, where he was nearly starved to death, when he fell into the hands of M'Leod of Assynt, who delivered him up to General Leslie, by whom he was brought to Edinburgh. Condemned to death as a traitor to the Covenant, he was executed, 21st May 1650. His demeanour in his last moments was very noble and dignified.

**MONTERRAT**, one of the Lesser Antilles, belonging to Britain, lies 43 miles north-west of Guadeloupe, and at a similar distance from Antigua and St Kitts. It is about 11 miles in length, 7 in breadth, and contains an area of 47 English square miles. The population in 1871 was 8693, the females exceeding the males by 737. About two-thirds of the surface is mountainous and barren, the rest is well cultivated. The chief products are sugar, rum, and molasses; but cotton, arrow-root, and tamarinds are also exported. The island forms a portion of the government of the Leeward Isles, and is directly ruled by a president, aided by a council and house of assembly. The chief town is Plymouth, on the south coast. The revenue of M. in 1871 amounted to £4195, and the expenditure to £4555. In the same year, the tonnage of vessels which entered and cleared its port was 12,214; and the total values of imports and exports were respectively £27,017 and £37,069.

**MONTERRAT** (Lat. *Mons Serratus*, so named from having jagged ridges like the teeth of a saw), a mountain of Catalonia, in the north-east of Spain, about 30 miles from Barcelona. Its height is 3919 feet. 'Its outline,' says Ford (*Handbook for Spain*, vol. i. p. 419), 'is most fantastic, consisting of cones, pyramids, buttresses, nine-pins, sugar-loaves, which are here jumbled by nature in a sportive mood.' The pious Catalonians aver that it was thus riven and shattered at the Crucifixion. Every rift and gorge is filled with box-trees, ivy, and other evergreens. From the topmost height, the eye wanders over all Catalonia, and from the sea the ridge looks like an immense wall with seven pyramidal peaks. The mountain, however, owes its celebrity not to its extraordinary appearance, but to the Benedictine Abbey built upon it, at an elevation of 1200 feet, and to the 13 hermitages formerly perched like eagles' nests on almost inaccessible pinnacles. In 1811, the French, under Suchet, plundered the abbey, burned the library, shot the hermits, and hung the monks (who had given shelter to their emigrant brethren at the Revolution). The place suffered still more in 1827, when it became the stronghold of the Carlist insurrection.

**MONUMENT** (Lat. *monumentum*, from *monere*, to remind), anything durable made or erected to perpetuate the memory of persons or events. The chief kinds of monuments are described under their special names. See CAIRN; CROMLECH; SEPULCHRAL MOUNDS; PILLAR; OBELISK; PYRAMID; ARCH; TRIUMPHAL; BRASSES; TOMB; STUPE; MAUSOLEUM, &c.

**MONZA** (anc. *Medetia*), chief town of a district in the province of Milan, stands on the river Lambro, 10 miles north-north-east of Milan, with which it is connected by railway. Pop. (1872) 16,000. It is essentially a town of Lombard growth, and under the Lombard sovereigns was capital of their kingdom.

## MONZA—MOON.

It owes much of its early importance, and its chief public edifices, to Theodolinda, the great queen of the Lombard dynasty. In the middle ages, M. was conspicuous for the wealth of its numerous citizens and nobles, and the extent of its cloth-trade. It has undergone 32 sieges. The cathedral, founded in the 6th c. by Theodolinda, contains many interesting memorials of this great queen. The famous Iron Crown (q. v.) and regalia of Lombardy, employed at the coronation of the German emperors as kings of Italy, were removed from Lombardy by the Austrians in 1859, on the cession of that province to France. The town has a good gymnasium, a theatre, two hospitals, and a philharmonic institution. Its present manufactures of cottons, hats, and preserved meats are daily increasing. M. is surrounded by an exuberantly fertile district, which yields abundance of grain, fruits, wine, and silk, and possesses great beauty of scenery and climate.

**MOON, THE**, the satellite of the earth, revolving round the earth from west to east in a period of one *Month* (q. v.), and in consequence accompanying the earth in its motion round the sun. As the moon, to an observer on the earth, advances more than  $13^{\circ}$  to the east daily, whilst the corresponding advance of the sun is barely  $1^{\circ}$ , her progress among the stars is much more notable than that of the latter. This rapid angular motion, the continual and regular variation of her illuminated surface, and her large apparent size (being nearly equal to that of the sun), have rendered the moon an object of general interest; while her importance as the principal nocturnal substitute for the sun, and her special value to navigators and geographers, in the determination of longitudes (see **LATITUDE** and **LONGITUDE**), have rendered the *lunar theory* the object of the most thorough and careful investigation.

**Phases of the Moon.**—The first peculiarity about the moon that strikes a casual observer, is the constant and regular change of her illuminated surface from a thin crescent to a circle, and *vice versa*, and a corresponding change in the time of her appearance above the horizon. These changes depend upon the position of the moon relative to the earth and the sun (fig. 1), for it is only the half

Fig. 1.—Phases of the Moon :

A, B, C, D, E, F, G, H, K, appearances presented by the moon to an observer situated at the pole of her orbit; A', B', C', D', E', F', G', H', K', 'phases' of the moon at the end of each eighth part of her course; E, position of earth; S, position of sun.

of the moon facing the sun that is illuminated by his rays, and the whole of this illuminated portion can only be seen from the earth when the sun, earth, and moon are in a straight line, S, A, E, F (the *line of syzygies*), and the earth is between the sun and moon. When the moon is in the line of syzygies, but between the earth and the sun, no part of her illuminated disc can be seen from the earth, A'. In

the former case, the moon is said to be *full*, and the latter, *new*. A few hours after 'new moon' moon appears a little to the east of the sun as a crescent, with the horns pointing towards the east, and as she increases her angular distance from the sun at the rate of about  $12^{\circ}$  daily, the crescent becomes broader, till, after the lapse of a little more than seven days, at which time she is  $90^{\circ}$  in advance of the sun, she presents the appearance of a circle of light, C'. The moon is then said to have completed her *first quarter*. Continuing her course she becomes 'Gibbous' (q. v.); and at the 15th day from new moon, attains a position 180° in advance of the sun, and now presents the appearance known as *full moon*, E'. From this point she begins to approach the sun, again appearing gibbous, after a third period of more than seven days, reaches a point  $90^{\circ}$  west of him, and enters her *last quarter*, H'. Here, again, she appears as a semicircle of light, the illuminated portion being that which was not illuminated at the end of the first quarter. The moon now rapidly approaching the sun, resumes her crescent form, but this time with the horns pointing westward, the crescent becoming thinner and thinner

Fig. 2.—Crescent Moon.

till the moon reaches the position of new moon, and disappears. From 'full moon' to 'new moon' the moon is said to be *waning*; and from 'new moon' to 'full moon,' *waxing*. The earth as seen from the moon presents similar phases, and has, consequently, at the time of new moon, the appearance of a small illuminated disc, and at full moon, is invisible. This explains the peculiar phenomenon occasionally observed when the moon is near the sun (either before or after new moon), of the part of the moon's face which is unilluminated by the sun appearing faintly visible, owing to the reflection upon it of a strong earth-light. This phenomenon is designated by the Scottish peasantry as 'the new mune wi' the auld mune in her arms.' At new moon, the moon of course comes above the horizon about the same time as the sun, and sets with him, but rises each day about 50 minutes later than on the day previous, and at the end of the first quarter, rises at mid-day, and sets at midnight, continuing to lag behind the sun. When at the full, she rises about sunset, and sets about sunrise, and at the commencement of her last quarter, she rises at midnight, and sets at mid-day.

**Distance and Magnitude.**—From repeated observations of the moon's horizontal *Parallax* (q. v.), and of the occultations by her of the fixed stars, her

## MOON.

distance\* from the earth has been estimated at miles, and as her angular diameter averages her actual diameter is 2153 miles, or a little more than  $\frac{1}{11}$ th of the earth's diameter. Her volume is about  $\frac{1}{25}$ th of that of the earth, and her being only .577 (that of the earth being unity), her mass is only  $\frac{1}{8}$ th of the earth's consequently, the force of gravity at her is so much less than it is at the surface of the earth, that a body which weighs 1000 pounds would at the moon weigh only 163 pounds.

The moon revolves round the earth in an orbit, with the earth in the focus; the eccentricity of the ellipse being equal to .05491 of half its axis, or more than  $\frac{1}{32}$  times that of the earth's. The plane of her orbit does not coincide with the ecliptic, but is inclined to it at an angle of  $5^{\circ}$ , and intersects it in two opposite points, are called the *Nodes* (q. v.). The point at the moon is nearest to the earth is called her perigee, and that at which she is furthest from it her apogee, and the line joining these two points is the *line of apsides*. Were the moon's orbit a perfect ellipse, which, owing to various irregularities as *perturbations*, it is not, the *lunar theory* would be exceedingly simple; but these perturbations, which, in the case of the planets, produce a variation in their orbit only after many years, cause, in the case of the moon, a distinct marked deviation from her previous course in each successive revolution. The retrogradation of her along the ecliptic causes a continual change in the plane of her orbit, so that if, during one revolution round the earth, she occults certain stars, at the next revolution she will pass to one side of them and will remove further and further from them in each successive revolution. A little comparison will shew that by this continual change in the plane of her orbit, the moon will, in course of time, pass occult every star situated within  $5^{\circ} 24' 30''$  of the ecliptic. The motion of the nodes is so rapid that they perform a complete circuit of the orbit in 18.6 mean solar days, or 18.6 years. Another marked change in the moon's orbit is the revolution of the line of apsides, by which the perigee and apogee are continually changing their position with respect to the earth and sun. This revolution is performed twice as rapid as that of the nodes, being performed in 3232.57 mean solar days, or 8.85 years. As this motion is common to all heavenly bodies, its nature and origin will be explained under the head of *Perturbations* (q. v.). The effect upon the moon is to produce a variation in her distance from the earth, independent of that produced by her elliptic motion.

*Eclipses*.—As the moon in her course passes the ecliptic at the commencement of every (synodic) month, and the middle of the month has placed her between herself and the sun, it is evident that if she moved in the plane of the ecliptic, there would be a total or an annular eclipse of the sun at the commencement, and a total eclipse of the moon in the middle of every month. The inclination of her orbit to the ecliptic, however, flowing her to pass the sun  $5^{\circ} 9'$  to the north or south of his track, prevents such a frequent occurrence of eclipses. If the moon, when in conjunction, is at either of her nodal points, and at the same time near her perigee, a total eclipse of the sun

takes place; but if near her apogee, the eclipse is only annular, for at that time her apparent diameter is less than the sun's. If, also, at her conjunction, her latitude north or south is less than the sum of her semidiameter and of that of the sun, a *partial* eclipse takes place, and is greater the nearer the moon is to her node. These partial eclipses are seldom seen from all parts of the earth's illuminated surface, but are confined to a portion of it, which is greater or less according to the extent of the eclipse. Lunar eclipses, which occur when the moon is in opposition (i. e., at full moon), are seen equally from all parts of the earth's surface which are turned towards her. The conical shadow of the earth which is projected into space on the side opposite to the sun, is in length equal to about  $3\frac{1}{2}$  times the moon's mean distance, and a section of it at the moon's distance is  $1^{\circ} 23'$  in diameter. If, then, the moon, which is never more than  $33\frac{1}{2}'$  in diameter, happens to be at or near her node, a total eclipse will take place, and in no case can it be annular, as is sometimes the case with those of the sun. Even during total eclipses, the moon is seldom quite invisible, but generally shines with a faint copper-coloured light. See *ECLIPSES*.

*Rotation*.—The moon, like all other satellites, as far as at present known, revolves round her own axis in precisely the same time that she revolves round the earth; she thus presents always the same face to us, and consequently, though her comparative proximity has enabled us to become better acquainted with her surface than with that of any other heavenly body, our knowledge is confined to one-half of her surface, with the slight exception of the knowledge obtained from her *Libration* (q. v.). To the inhabitants of the side of the moon next the earth—if the moon had inhabitants, which is very improbable—the latter would appear as a luminary about  $2^{\circ}$  in diameter, immovably fixed in their sky, or at least changing its position only to the extent due to the moon's libration. The earth would thus seem to them to have a disc about 15 times larger than that of the sun.

*Physical Features*.—The surface of the moon, as seen from the earth, presents a most irregular grouping of light and shade (fig. 3). The dark

portions were named by the earlier astronomers as seas, lakes, &c., and still retain these names, although there is strong evidence against the supposition that the moon, or at least that portion of it

Fig. 3.—Telescopic appearance of the Moon.

portions were named by the earlier astronomers as seas, lakes, &c., and still retain these names, although there is strong evidence against the supposition that the moon, or at least that portion of it

accomplishment which was of service to him in his future career.

In 1798, with his translation of Anacreon in his pocket, he came to London to study law, and entered himself in the Middle Temple. In 1800, he published his translations, dedicated to George IV., then Prince of Wales. In 1802, he produced his *Poetical Works of the Late Thomas Little*—a volume of sweet but licentious verse, which was a good deal blamed, and very widely read. In 1803, through the influence of Lord Moira, he was appointed to a government post at Bermuda. He arrived there in January 1804; but finding his situation disagreeable, he committed his duties into the hands of a deputy, and travelled in America previous to his return to England. His transatlantic experience seems to have cured him of the democratic ideas which he had imbibed in Dublin. On his return to England, he published *Odes and Epistles*, for which he was sharply taken to task in the *Edinburgh Review*. A duel between himself and Jeffrey was the consequence—over which Byron made so much mirth—and which resulted in the combatants becoming the most excellent friends. In 1807, he engaged with Mr Power to produce the *Irish Melodies*, and on this work he was engaged at intervals up till 1834. In 1811, he married, and shortly after, he went to reside in Derbyshire, where in 1813 he produced *The Twopenny Post-bag*, full of brilliant fancy—in which the tropes not only glittered but stung.

As up to this time he had produced nothing but fugitive pieces, he became anxious to emulate his brethren, who wrote long poems, and published in quartos. He fixed on an oriental subject, and the Messrs Longman agreed to purchase the poem for 3000 guineas. In 1817, the long-expected *Lalla Rookh* appeared—brilliant as a firefly, and the whole English world applauded. After the publication, he went to Paris, where he wrote *The Fudge Family*, which appeared in 1818. At this time, he learned that his deputy in Bermuda had misconducted himself, and that he had become liable for a large sum, which was afterwards, however, considerably reduced. Lord Lansdowne paid the claim, and M. repaid his lordship afterwards.

In 1819, M. went to Paris with Lord John Russell, and extended his tour to Italy, and saw Lord Byron at Venice. He returned to Paris, where he brought his family, and fixed his residence till 1822. Here he wrote *The Loves of the Angels*, which appeared in 1823, and *The Epicurean*, a prose romance, which was not published till 1827. On his return to England, he fixed his abode at Sloperton Cottage, near Bowood, and issued the *Memoirs of Captain Rock* in 1824, and the *Life of Sheridan* in 1825.

Byron had handed over to M., for his own especial benefit, a manuscript autobiography, on the condition that it should not see the light till after its author's death. Byron died in 1824, and as, at the request of his lordship's relatives, the manuscript was destroyed, M. then entered into arrangements with Murray to produce a life of the deceased poet. The *Life of Lord Byron* was published in 1830 in two volumes. Next year, he published the *Life of Lord Edward Fitzgerald*. His last important work was a *History of Ireland*, published in *Lardner's Cyclopædia*. A pension of £300 per annum was conferred on him in 1835. In 1841, he brought out an edition of his entire poetical works. For the three years preceding his death, he was afflicted with softening of the brain. He died on the 25th February 1852. His friend, Lord John Russell, has since published his *Memoirs, Journal, and Correspondence*, in eight volumes.

Despite his popularity during his lifetime, M. can hardly be placed in the rank of great poets. His muse is a spangled dancing-girl—light, airy, graceful, but nothing more. His most ambitious work, *The Loves of the Angels*, is far beneath the Miltonic, or even the Byronic standard. *Lalla Rookh* is brilliant, but fatiguing. He is most successful in polished satire and the lighter sentiments; and his reputation will ultimately rest on *The Twopenny Post-bag* and the *Irish Melodies*.

**MOORFOWL, RED GROUSE**, or, in books of natural history, **RED PTARMIGAN** or **BROWN PTARMIGAN** (*Lagopus Scoticus*), a bird peculiar to the British Islands, and affording more amusement to sportsmen than any other kind of feathered game in Britain. It is the bird generally known in Britain by the name *Grouse*, although not a true species of Grouse, but rather of Ptarmigan (q. v.). The toes are completely feathered, as well as the legs; the bill is very short, and its base much concealed by feathers. The length of the M. is about sixteen inches, of which about four inches belong to the tail. The tail is nearly square. The wings are short. The plumage is of a deep chestnut-brown colour, marked on the back and wing-coverts with black spots, and on the under-parts with undulating black lines; the four middle tail-feathers are also marked with transverse black lines. Above the eyes is a naked

Moorfowl, or Red Grouse (*Lagopus Scoticus*)

space (the cere), of a bright scarlet colour. The M. is plentiful in the moors of Scotland and the Hebrides, Wales, the north of England, and Ireland. It feeds on the tender tops of heath, crowberries, bilberries, &c.; and not unfrequently visits the fields of oats and other grain in the vicinity of the moors, particularly when the *stooks* remain long in the field in late and rainy harvests. The M. is not polygamous, and pairs in spring, when the plumage—particularly of the male—assumes a lighter and redder tint. The female lays from eight to fifteen eggs. The nest is on the ground, often under shelter of a tuft of heath. The young run about very soon after they are hatched. 'Grouse' remain in coveys (broods) from the time they are hatched till late in the autumn, after which they 'pack' or assemble in large bodies.—A cream-coloured variety of M. is sometimes found in the north of England.—The M. is easily domesticated, and breeds readily in an aviary, if supplied with heath for food.

**MOORHEN.** See GALLINULE.

**MOORING** (allied probably to Dutch *moeren* to delay, fasten; Eng. *marline*, for fastening the sail to the bolt-rope; Lat. *mora*, delay), a fastening to retain a ship in a given position. This may be either by her own anchors, or (which is the most

**MOORUK** (*Casuarus Bennettii*), a recently discovered bird of the same genus with the Cassowary. It was at first regarded as a mere variety of the island of New Britain. It grows in full height, three feet to the top of the head, is of a reddish colour, mixed with

Mooruk (*Casuarus Bennettii*).

black, and has a horny plate instead of a helmet-like protuberance on the top of the head. The claw of the inner toe of each foot is very long. It becomes extremely tame and familiar in captivity; may be fed on potatoes, maize, or any similar food; and is apt to prove troublesome by swallowing anything, however indigestible, that may come in its way.

**MOOSE.** See ELK.

**MORA** (Lat.) is a word often used in Scotch law to denote delay caused by negligence. In England and Ireland, the corresponding word is Laches (q. v.).

**MORA**, a genus of trees of the natural order Leguminosae, sub-order *Casalpinieae*, containing only one known species, *M. excelsa*, discovered by Sir R. Schomburgk, and described by him as the most majestic tree of Guiana. The timber is said to be equal to oak of the finest quality. It is already a considerable article of commerce, under the name of *Mora wood*. It is darker than mahogany. It is valued for ship-building.

**MORA'CEÆ**, a natural order of exogenous plants, or, according to many botanists, a sub-order of *Urticeae* (q. v.). The M. are trees or shrubs with rough leaves and sometimes with climbing stems; they have a milky juice; the flowers are very small; the fruits of many flowers are often enclosed in a succulent receptacle, or the calyx becoming fleshy, all the fruits of a head or spike become combined into one. There are about 200 known species, natives of temperate and tropical climates. Some are valuable for their fruit, some for the caoutchouc obtained from their milky juice, and different parts of others are applied to various uses. Among the species are figs, mulberries, Osage orange, fustic, and contrayerva.

**MORaine.** The masses of rock which, by atmospheric action, are separated from the mountains bounding the valleys along which glaciers flow, find a temporary resting-place on the surface of the ice,

## MORALITIES—MORAVIA.

at the margin of the glacier, and are carried along with it, but so slowly, that they form a continuous line along each margin. These lines of débris are called *lateral moraines*. When two glaciers unite, the two inner moraines unite also, and form one large trail in the middle of the trunk glacier, and this is called a *medial moraine*. A large portion of these rocky fragments at length reaches the end of the glacier, and here the melting ice leaves it as a huge mound, which is known as a *terminal moraine*. See GLACIER.

**MORALITIES.** See MYSTERIES.

**MORALS.** See ETHICS.

**MORA'NO**, a city of Southern Italy, province of Calabria Citeriore, built on a hill in a wild and rugged neighbourhood, 35 miles north-north-west of Cosenza. Pop. 8350. It has good manufactures of silk, cotton, and woollen fabrics.

**MORAT** (Lat. *Moratium*, Ger. *Marten*), a town of (1871) 2328 inhabitants, in the canton of Freiburg, Switzerland, on the Lake of Morat, about twelve miles from Bern, famous for the victory of the Swiss and their allies over Charles the Bold, Duke of Burgundy, June 22, 1476. The duke, exasperated by his defeat at Grandson, in March, appeared before the gates of M. with 40,000 men. The Swiss were aided by Strasburg, Basel, Colmar, and other Rhenish cities, and by Duke René of Lorraine, whom the Duke of Burgundy had driven from his possessions; but the superiority of numbers was greatly on the side of the Duke of Burgundy. The assault of the Swiss, however, was very impetuous, and their victory complete; the duke's camp fell into their hands, and he himself only escaped by the swiftness of his horse.

**MORATIN**, LEANDRO FERNANDEZ DE, the most eminent comic poet that Spain has produced in recent times, was born at Madrid, March 10, 1760. His father, Nicolas Fernandez de Moratin, was also a poet of some eminence, but having found that literary labours afforded a precarious support, he wished his son to learn the trade of a jeweller, by which, after his father's death, he, in fact, for some time supported himself and his mother. In 1790, appeared his first and best comedy, *El Viejo y la Niña*; it was followed by *La Comedia nueva El Barón*, *La Mogigata*, and *El sí de las Niñas*. He found a powerful patron in Prince Godoy, who conferred several ecclesiastical benefices upon him, so that he was placed in circumstances of comparative affluence; but the Inquisition set its evil eye upon the poet, and M. had to 'walk softly.' Joseph Bonaparte made him chief royal librarian; but after the return of Ferdinand, in 1814, he was deprived of all his offices, and found it expedient to take refuge at Paris. The latter years of his life were devoted to a work of great learning, entitled *Orígenes del Teatro Español* (History of the Rise of the Spanish Drama). He died in Paris, June 21, 1828. His works were published in a collective edition (6 vols., Madr. 1830—1831).

**MORA'VA**, or, more properly, **MARCH** (called by the ancients *Marus*), a river of Austria, has its origin on the southern slope of the Schneeberg, on the borders of Prussian Silesia, 3882 feet above sea-level. It is the chief river of Moravia, to which it gives its name, and flows south through that crown-land, receiving on the right the Thaya, and falling into the Danube, eight miles above Presburg. In its lower course, it forms the boundary between Lower Austria and Hungary. Its course is 184 miles in length, and it is navigable from Göding, upwards of 60 miles from its mouth.

**MORA'VIA** (Ger. *Mähren*), a crown-land of the Austrian empire, situated in 48° 40'—50° N. lat., and 15° 5'—18° 45' E. long. It is bounded N. by Prussian and Austrian Silesia, E. by Hungary and Galicia, S. by the duchy of Austria, and W. by Bohemia. The superficial area is about 8480 square miles; and the population in 1870 was 2,017,974.

M. is enclosed and traversed on all sides by mountains, being separated from Silesia by the range of the Sudetes; from Bohemia, by the Moravian chain; and from Hungary, by the Carpathian Mountains; while branches of these various chains intersect the whole country except in the south, where the land consists of extensive plains, lying about 800 feet above the level of the sea. The numerous small rivers of the interior follow a south-east direction, and fall into the March or Morava, from which the country derives its name, and then flow together with the latter into the Danube. The Oder, and its affluents the Elsa and Oppa, rise among the mountains on the north-east, from whence their course is soon turned directly away from the Moravian territory. There are few extensive lakes, but numerous ponds and small streams which abound in fish. The more elevated parts of the country are not fertile, and the climate is severe; but in the mountain valleys and on the southern plains, the soil is remarkably rich, and the temperature more genial than in other European countries lying in the same parallel. M., which ranks as one of the richest of the Austrian dominions, has half of its area in arable land. It yields the crops of grain, and among the other natural products grown for exportation, we may instance hops, mustard, potatoes, clover-seed, beet-root; and in the south, maize, grapes, chestnuts, and many other of the less hardy fruits and vegetables. The breeding of cattle and sheep, and the making of cheese from sheep's milk, constitute an important branch of industry; in the southern districts of the Haase (a plain famous for its fertility), horses are bred for exportation. Geese and fowls are reared in large numbers for the sake of their feathers, and the keeping of bees is conducted with great success. The mineral products include iron, alum, saltpetre, coal, graphite, whetstones, sulphur, vitriol, pipe-clay, marble, and topazes, garnets, and other precious stones.

**Industry, &c.**—The principal branches of industry are the manufacture of linen and thread, which now enjoy a European reputation, and those for cotton goods at Sternberg. M. has long been noted for the excellence of its cloths, flannels, and other woollen fabrics, and for its leather goods. Brunn (q. v.), the capital, is the chief emporium for the manufacturing trade, and Olmütz (q. v.) the principal cattle-mart. M. is divided into the two circles of Brunn and Olmütz, the former of which consists of 12, and the latter of 13 governmental districts.

The educational wants of the province are well provided for by a university at Olmütz, 1 Protestant, and 12 Catholic gymnasia, besides numerous parish and other schools in the rural districts. The majority of the people belong to the Church of Rome. There are about 50,000 Protestants, and 40,000 Jews.

In regard to nationality, the population may be divided as follows: About 500,000 Germans, upwards of a million and a half of Slavonians, and 50,000 belonging to other nations. The Slavonians of M. are composed of Czechs and Poles, the former of whom are inferior to their brethren in Bohemia, being an incorrigibly lazy, dirty people. The Moravian Poles, although inferior to the Germans in industry and cultivation, are

at sacred digit which is composed of

In this manner the moon, with its 15 days of the moon's increase, the dark fortnight (when in the wane); with the cool nectary aqueous atoms it them; and through their development men, animals, and insects, at the same time by its radiance.

**MOUNTAINS OF THE.** The 'Mountains of the Moon' have ever played an important part in the history of African geography, and have given rise to many curious hypotheses. Ptolemy, and many of the ablest geographers, supposed a very high chain of mountains crossed Africa from east to west; and continued to shift these mountains from east to another, ranging from 10° north to 10° south, still keeping them within nearly the same bounds. Dr Beke, from his own and a minute study of the geography of Africa, propounded the theory, that the Mountains of the M. run from north to south parallel to the coast of Zanzibar, from east to west; forming, in fact, a part of the great Abyssinian table-land, rising the snow-capped mountains of Kilimandjaro, which have a supposed height from 12,000 to 20,000 feet.

Mountains discovered by Captain Speke, round the head of Lake Tanganyika, and by him, both from its crescent form, to be part of the Mountains of the Moon; but mountains of this height (6000 ft.) could never be snow-clad so near the equator.

**AM, MUNJAH, or MOONYAH** (*Munja*), a genus of the same genus with *Am*, a native of India, the leaves of which are a useful fibre, of which ropes are made. *M. groves* in vast abundance in the valley of the Ganges, India, and other parts of the M. is very tough and strong. Proper trial seems yet to have been made of the M. fibre, more carefully than considering the facility with which it is obtained in any desirable quantity, it deserves attention.—Very similar to the *M. groves* of Bengal (*Saccharum groves*). The leaves of the same genus, the leaves of *Am* are employed in the same way.

**MOORE.** See **FELTZER**.

**MOORE, M. D.**, a Scottish physician and writer, son of the Rev. Charles Moore, Episcopalian clergyman, was born at Glasgow in 1730. Educated at the university of Glasgow, he began the study of medicine under Dr Gordon, surgeon, of that city, and followed up in Holland, London, and then, as the partner of his old friend, began to practise in Glasgow, attending to the Duke of Hamilton, he was in travelling on the continent, and in 1778, settled in London. In 1779, he published *A View of Society and Manners in Scotland, and Germany* (Lond. 2 vols. 8vo), appeared *A View of Society and Manners* (2 vols. 8vo); in 1786, his *Medical Jurisprudence* two parts; and in 1789, *Zelus*, a novel—the principal, or, at any rate, the most interesting of his works. His other works are—*A History of the French Revolution*, 1792 (2 vols. 8vo); a series of scenes witnessed while at Paris in that year as medical attendant of the British army; *A View of the Causes and*

*Progress of the French Revolution* (2 vols. Lond. 1795); *Edouard*, a novel (Lond. 1796); and *Mordant*, a novel (Lond. 1800, 3 vols. 8vo). He also edited a collected edition of Smollett's works, with a life of the author. He died at Richmond in Surrey, Feb. 20, 1802.

**MOORE, SIR JOHN**, English general, born at Glasgow, 1761, was eldest son of the preceding. He entered the army as ensign when only 15, and served with distinction in Corsica, as colonel; in the West Indies, as brigadier-general; in Ireland during the rebellion of 1798, and in the expedition to Holland, as a general of staff. He was in Egypt with the army under Abercromby, and obtained the order of the Bath for his services in command of the reserve. When war again broke out in 1802, M. served in Sicily and Sweden. In 1808, he was sent with a corps of 10,000 men to strengthen the English army in the Peninsula. He arrived in Mondego Bay, August 19, and assumed the chief command on the return to England of Sir H. Burrard. In October he received instructions to co-operate with the forces of Spain in the expulsion of the French from the Peninsula. He moved his army from Lisbon, with the intention of advancing by Valladolid, to unite himself with the Spanish general Romana, and threaten the communications between Madrid and France. But the apathy of the Spaniards, and the successes of the French in various parts of the Peninsula, soon placed him in a critical position. Yet he had determined to make a bold advance from Salamanca to attack Soult, when the news reached him that Madrid had fallen, and that Napoleon was marching to crush him at the head of 70,000 men. M.'s forces amounted to only 25,000 men, and he was consequently forced to retreat. In December, he began a disastrous march from Astorga to Coruña, a route of near 250 miles, through a desolate and mountainous country, made almost impassable by snow and rain, and harassed by the enemy. The soldiers suffered intolerable hardships, and arrived at Coruña in a very distressed state. It was impossible to embark without fighting, and Soult was in readiness to attack as soon as the troops should begin to embark. The battle was mainly one of infantry, for the cavalry, after destroying their horses, had gone on board, and the bulk of the artillery, for which the ground was not adapted, had also been withdrawn. On the 16th January 1809, the French came on in four strong columns. A desperate battle ensued. While animating the 42d Regiment in a brilliant charge in an early stage of the action, M. was struck by a cannon-ball on the left shoulder, and died in the moment of victory. The French were defeated with the loss of 2000 men; and the funeral obsequies of the deceased soldier were performed with melancholy solemnity just before the embarkation of his troops. The British army in this expedition lost their magazines and 6000 soldiers. A monument was erected to M.'s memory in St Paul's Cathedral.

**MOORE, THOMAS**, the son of a small tradesman, who, through the influence of Lord Moira, afterwards became a barrack-master in the army, was born in Dublin on the 28th May 1779. At an early age, he was placed at a school in which Sheridan had formerly been a pupil. In 1793, he was sent to the Dublin University, where he ultimately took the degree of B.A. Before entering the university, he had written verses for a Dublin magazine; and while there, he translated the *Odes of Anacreon*, in the hope of obtaining a classical premium, in which, however, he was disappointed. In Dublin, he acquired Italian and French, and being fond of music, he learned to play on the piano—

## MORAY FIRTH—MORE.

**MORAY FIRTH**, an indentation of the German Ocean, on the north-east coast of Scotland. Its north-west shore is formed by the counties of Ross and Cromarty, and extends from Kessock Ferry, opposite Inverness, to Tarbet Ness. Its south-east shore extends from Inverness to Burghead, in Elginshire. The entrance of the firth between Burghead and Tarbet Ness is 16 miles in width; and from its entrance to Inverness it is 31 miles in extent. The firth is continued westward from Inverness by a branch called Beaulieu Basin.

**MORAYSHIRE.** See **ELGINSHIRE**.

**MORBID APPETITES** may consist of a desire which is, in character, natural and necessary to the animal economy, but becomes unhealthy when excessive and irresistible. Of this, the hunger which attends marasmus, and the thirst which attends diabetes, may be cited as illustrations. They may consist further, in a craving for articles or objects not in reality deleterious or detrimental, but which do not constitute the ordinary gratification of the appetite, such as the desire for chalk and lime experienced by chlorotic and hysterical women. They may, thirdly, consist in the longings, often complicated with delusions, felt by pregnant women and others, which are injurious, repugnant to nature, and revolting. Georget gives an instance where a wife coveted the shoulder of her husband, killed him in order to obtain the morsel, and salted the body in order to prolong the hideous cannibalism. In such a case, the gross longing may be said to constitute the disease; but there are others in which it is one of many symptoms demonstrating the degradation of the mind under general disease, as when the insane devour garbage, excrement, or swallow grass, hair, stones.—Georget, *Dict. de Médecine*; Feuchtersleben, p. 276.

**MORBIHAN**, a maritime department in the north-west of France, formed out of ancient Bretagne. Area, 1,689,836 acres; pop. 490,352. The coast is much indented, and has a multitude of bays, roadsteads, harbours, and islands. The largest island is Belle Isle (q. v.). The department has a somewhat hilly appearance, but towards the sea, the land stretches out in rich plains, interrupted, however, by great tracts of heath and marsh. The climate is mild, but moist. The soil is not well cultivated, but yields sufficient grain for home consumption. The heaths afford fine pasturage, and support great herds of horned cattle, sheep, and horses. The rearing of bees is a source of very considerable revenue; as also are the river and coast fisheries. The trade in sardines is particularly extensive. The want of wood is so great, that the peasants are obliged to burn dung extensively. The chief mineral is iron, but there are almost no manufactures. M. is divided into the four arrondissements of Vannes, L'Orient, Ploermel, and Pontivy. The chief town is Vannes (q. v.), but the most populous is L'Orient (q. v.).

**MORDANTS.** See **DYEING**.

**MORDAUNT, CHARLES**, Earl of Peterborough, military and naval commander, and one of the most brilliant Englishmen of his time, was the son of John Lord Mordaunt, and was born in 1658, some say 1662. He served as a boy in the navy, and then entered the army. He took part against James II., and was made Earl of Monmouth by William III., succeeding afterwards to the earldom of Peterborough, as heir to his uncle. During the war of the Spanish Succession, the English government determined to send an expedition to Spain. It was placed under the command of M.; and in June 1705, he arrived in Lisbon with 5000 Dutch and English soldiers.

After taking on board the Archduke Charles of Austria, who claimed the Spanish crown, the armament proceeded to Valencia. Here M., with characteristic daring, conceived the idea of making a dash at Madrid, and finishing the war at one blow. He was overruled by the archduke and the Prince of Hesse, and compelled to besiege Barcelona, which was defended on one side by the sea, and on the other by the strong fortifications of Monjuich. By a *coup de main*, he made himself master of Monjuich. Barcelona fell, and M., with a handful of men, entered one of the strongest cities of Europe. He pushed his successes into the interior. Several towns submitted. He marched to Valencia in the depth of winter, and at the head of 1200 men defeated a Spanish force of 4000. The Spaniards sent a large army into Catalonia, and a French fleet appeared off Barcelona. M. harassed the enemy's army, and putting himself on board the English squadron, directed a movement which, had it been executed a few hours earlier, would have resulted in the capture of the whole French fleet. The Frenchmen put to sea, and Barcelona was saved. M. again wished to march towards Madrid, but his plan of gaining possession of the capital was once more rejected by Charles. He accordingly left the army in a fit of pique, and went to Italy. In 1707, he returned to Valencia as a volunteer, and gave excellent advice, which was not followed. He was recalled to England, and from that moment the tide of fortune ran strong against the Austrian cause. Few generals have done so much with means so small, or displayed equal originality or boldness. His fertility and activity of mind were admirably seconded by a most intrepid spirit. His splendid talents, on the other hand, were disfigured by vainglory, and a morbid craving for novelty and excitement. He loved to fly round Europe, and was said to have seen more kings and postilions than any other man of his day. On his return, he made common cause with the Tories, to spite the Duke of Marlborough, and received the Garter and other dignities for his services. On the accession of George I., he was appointed commander-in-chief of the naval forces of Great Britain; but was never again employed in active service. He died at Lisbon 25th October 1735. His witty, yet affectionate letters to Pope, Swift, Prior, &c., give a fine insight into his private character. See *Earl Warburton's Memoir of Charles Mordaunt, Earl of Peterborough and Monmouth, with Selections from his Correspondence*, 2 vols. (1853). His character has been sketched by Horace Walpole, in his *Catalogue of Royal and Noble Authors*; and with still greater force and picturesqueness by Macaulay.

**MORE, SIR THOMAS**, Lord Chancellor, and one of England's worthiest sons, was born in Milk Street, London, in 1480, son of Sir John More, Justice of the Queen's Bench. He was educated at St. Anthony's School, Threadneedle Street; and in his fifteenth year was placed in the house of Cardinal Morton, Archbishop of Canterbury, who used to say of him: 'This child here waiting at the table, whatsoever shall live to see it, will prove a marvellous man.' Dean Colet, too, was wont to say: 'There was but one wit in England, and that was young Thomas More.' In 1497, M. went to Oxford, where he made the friendship of Erasmus. He then applied himself to the law, and studied first at New Inn, and afterwards at Lincoln's Inn. He was appointed reader at Furnival's Inn, where he lectured for three years. At the accession of Henry VIII., his professional practice was considerable, and he also held the office of judge of the Sheriff's Court in the city—his income from these sources being equivalent to £4000 or £5000 of our present money.

## MORMONS.

County, in the same state, where they remained upwards of three years. In July 1834, they were visited by the 'prophet' himself, accompanied by 100 persons, mostly young men, and nearly all priests, deacons, teachers, and officers of the church. During a brief residence of one week among them, he accomplished much in the way of vigorous organisation; next year, 1835, a further step was taken in the development of a hierarchy by the institution of a body of apostles—twelve in number—who were sent out to preach the new doctrines among the Gentiles. One of these twelve was the famous Brigham Young, who had become a convert about the close of 1832, and had soon shewn himself to be a man of wonderful sagacity and force of character. He was ordered down east among the Yankees, and made numerous converts even among this acute people. In 1837, Orson Hyde and Heber C. Kimball were despatched as missionaries to England, where they received large accessions to their numbers, especially from the masses in the great manufacturing and commercial towns, Manchester, Liverpool, Leeds, Birmingham, Glasgow, and, above all, from the mining districts of South Wales, where Mormonism, in some places, almost competed for popularity with Methodism itself. Since then, they have extended their strange evangelisation to the East Indies, Australia, the islands of the Pacific, Egypt, Palestine, Turkey, and almost every country on the continent of Europe.

About the close of 1837, or the beginning of 1838, the bank at Kirtland stopped payment, and proceedings were taken against the prophet and others for swindling. Luckily, just at this moment, he received a 'revelation' to depart into Missouri, which he instantly obeyed, with all the more alacrity that internal disorders had painfully manifested themselves in the new colony. These were at last healed; but the conflict between the Saints and the other Missourians became fiercer, more envenomed, more sanguinary than ever, assuming, in fact, almost the proportions of a civil war. The prophet and Rigdon were thrown into prison, and finally, towards the close of 1838, the whole body of Saints, about 15,000, quitted Missouri, and took refuge in Illinois. Here they obtained a grant of land in the vicinity of the little town of Commerce, a name which the M., in obedience to a 'revelation' given to Smith, changed to Nauvoo, or The City of Beauty. The country was a mere wilderness when the M. settled in it: it soon began to rejoice and blossom as the rose. Lieutenant Gannison (a most intelligent and impartial writer) is forced by facts to be eloquent in praise of Mormon industry, and gives us a perfectly enchanting picture of the new colony. The legislature of Illinois granted a charter to Nauvoo; a body of Mormon militia was formed, under the name of the Nauvoo Legion, of which the prophet was appointed commander; he was also appointed mayor of the city, and was thus supreme in all matters civil and military, as well as religious. But the doctrine of 'sealing wives' once more roused the wrath of the neighbourhood, and serious disturbances took place, the ultimate result of which was that the prophet and his brother Hiram were thrown into prison at Carthage. After a short time, it began to be rumoured that the governor of the state was desirous of letting the two Smiths escape, whereupon a band of 'roughs,' about 200 in number, broke into the jail, 27th June 1844, and shot them. Disastrous as this termination of his career was to Smith himself, there cannot be the shadow of a doubt that it was a most fortunate thing for the system which he founded. 'The blood of the martyrs is the seed of the church.' A halo of solemn and tender glory

now encircles the memory of one who stood greatly in need of this spiritual transfiguration. It may here be stated that it cannot be shewn that Smith was a polygamist, in our sense of the word. Years after his death, Brigham Young produced a paper which he said was a copy of a 'revelation' made to Joseph at Nauvoo, commanding him to take as many wives as God should give him. But it was not till August 29, 1852, at a public meeting held in the Salt Lake City, that the 'revelation' was formally received.

Smith's death created great agitation and confusion among his followers. Sidney Rigdon and others aspired to succeed him, but the Council of the Twelve Apostles unanimously elected Brigham Young, and events have shewn the wisdom of their choice. The legislature of Illinois having revoked, in 1845, the charter given to the city of Nauvoo, and the hostility of their neighbours not having in the least abated, the Saints resolved to emigrate far beyond the boundaries of civilisation, and to seek a new home amid the solitudes of the Rocky Mountains, where they might pass their lives in unmolested peace. Explorers were sent out to examine the country, and brought back a favourable report of the Great Salt Lake Valley. See GREAT SALT LAKE, SALT LAKE CITY, and UTAH. In February 1846, the first emigrants crossed the ice-bound Mississippi, settled for a year in Iowa, and then marched under the strictest discipline across the great wildernesses. Agricultural operations were commenced almost the instant they arrived at the shores of the Salt Lake. The cheerfulness, intelligence, and zeal exhibited on all sides, were truly admirable. The world has never seen swifter, more active, more glad-hearted colonists than these singular 'Saints.' It would be unfair to shut our eyes to such facts. In judging Mormonism, we must keep them constantly in view, to prevent us from forming mere abstract and theoretical decisions, which will not in the least affect the future of Mormonism. Brigham Young arrived in the Valley, July 24, 1847, and the main body of the M. in the autumn of 1848. The Salt Lake City was soon founded, an emigration fund established, and settlers poured in from all parts of Europe and America; and perhaps a greater amount of physical comfort was enjoyed here than in any other part of the world. In 1850, the government of the United States admitted the region occupied by the M. into the Union, as a territory, under the name of UTAH, and Brigham Young was appointed governor by President Fillmore. District judges were also appointed by the federal government, but these were looked upon with great suspicion and mistrust by the Saints, who finally drove them out of the country in 1851. Brigham Young was now suspended from his office of governor, and Colonel Steptoe of the United States army was appointed his successor. He arrived in Utah in 1854, but found it prudent after some time to withdraw from the country. During the next two years, the collisions between the United States officers and the Saints became more and more frequent, and in the spring of 1856, the whole of the former were forced to flee from the territory. A new governor, Alfred Cumming, was appointed by the authorities at Washington in 1857, and also a new superintendent of Indian Affairs; besides, a force of 2500 men was sent to enforce obedience to the laws of the United States. The Saints attacked their supply-trains, and compelled the enemy to winter at some distance from the Salt Lake. In the early part of next year, negotiations were entered into between the contending parties; the M. submitted to the federal authority, and the federal troops were allowed to encamp on the western side of Lake Utah, about

the chief command on the Rhine and Moselle. He crossed the Rhine at Kehl, defeated Latour at Rastadt, and the Archduke Charles at Ettlingen, and drove the Austrians back to the Danube. But, owing to errors in the plan of the campaign, against which he had in vain remonstrated with the Directory, M. found himself in danger of being cut off from the Rhine, and was obliged to make a desperate effort to regain that river, which he accomplished, notwithstanding great difficulties, by a march of forty days. This retreat established his reputation for generalship more than all his previous victories.

A suspicion of participation in the plots of Pichegru led to his being deprived of his command, after the *coup d'état* of 18th Fructidor. In the following year, he succeeded Schérer in the command of the army in Italy, when it was hard pressed by the Russians and Austrians, 25,000 men being opposed to 80,000. By a retreat conducted with consummate skill, and in course of which he even gained victories, he saved the French army from destruction. The Directory, nevertheless, deprived him of the chief command, and gave it to Joubert. But M. remained with the army, and aided that young general to the utmost; and after his death at Novi, again assumed the command, and conducted the defeated troops to France. The noble disinterestedness of M.'s character, his military talent, and his political moderation, induced the party which overthrew the Directory, to offer him the dictatorship of France, which he declined, and lent his assistance to Bonaparte on 18th Brumaire. Receiving the command of the army of the Rhine, M. gained victory after victory over the Austrians in the campaign of 1800, and at last won the great and decisive battle of Hohenlinden (q. v.). A strong feeling of mutual distrust now arose between M. and Bonaparte, who sought in vain to win him to himself; and M.'s country-seat, to which he retired, became the gathering-place of the discontented. Bonaparte surrounded him with spies, and ere long he was accused of participation in the plot of Cadoudal (q. v.) and Pichegru against the life of the First Consul. He was arrested, brought to trial, and found guilty on 10th June 1804, although the evidence against him was utterly insufficient. But Bonaparte could not venture upon a sentence of death, and a sentence of two years' imprisonment was therefore pronounced, which was commuted into banishment, and M. went to America, where he settled in New Jersey. Regarding with great dissatisfaction the whole of Bonaparte's further career, he thought it his duty to France to give his aid to the allies in the campaign of 1813, and leaving the United States in the company of a Russian agent, he landed at Gothenburg, had an interview with the Crown Prince of Sweden, the former General Bernadotte, and accompanied the emperor of Russia and the king of Prussia in the march against Dresden, where, as he stood with the Emperor Alexander on a height at Raacknitz, on 27th August, a French cannon-ball broke both his legs. Amputation was performed, but he died at Laun in Bohemia, 2d September 1813.

MORECAMBE BAY, an inlet of the Irish Sea, on the north-west coast of England, separates the main portion of Lancashire from the detached portion of Furness. It is about 10 miles in average breadth, and is 16 miles in length. It receives the Kent, the Keer, and the Lune. The depth of water in the bay is never great except in the channels of the rivers; and when the tide is out, the water entirely withdraws for the time, and there is a road, although a dangerous one, across the sands from the vicinity of Lancaster into Furness.

MOREEN. See MOIRE.

MOREL (*Morchella*), a genus of fungi, division *Hymenomycetes*, having a fistular stalk, a roundish or conical *pileus*, the upper surface of which is divided into an irregular network of ridges or pits, and bears the *hymenium*. They grow on moist ground, and have a more or less agreeable taste. Some of them are reckoned among the edible fungi, of which the best known is the COMMON MOREL (*M. esculenta*), a fungus rare in Britain, but

Common Morel (*Morchella esculenta*).

in many parts of the middle and south of E. Its stalk is only about an inch high, and is roundish, oval, oblong, or conical, yellowish or pileus. It is nutritious, and not difficult of digestion, but is chiefly used in sauces and gravies, on account of its pleasant flavour. It is used either fresh, dried, and is often brought to market in a state. It grows in lawns, and among fallen leaves in the thinner parts of woods where the soil is rich, and makes its appearance in spring. It is an excellent ketchup. In Germany, the M. is highly prized, and as it very often springs up when a forest has been burned, the forests of Germany were often destroyed for its sake, till this practice was restrained by severe penalties. Its cultivation has not been attempted, although probably it would not be difficult.—A very similar species is *M. bohemica*, which is used in the same way; as is also the BOHEMIAN M. (*M. bohemica*), which has a 4–8 inches high, and a thimble-shaped, white-margined pileus, with longish narrow ridges; many various forms; abundant in Bohemia when dried in a baker's oven, a considerable quantity is exported. The name *M. (Morchella)* is extended in Germany to some of the edible species of *H. (q. v.)*.

MORE'SQUE. See ARABESQUE, GROTESQUE.

MORETON BAY, on the east coast of Queensland, Australia, is formed inside the island of Moreton and Stradbroke, the former 23 miles in length, the latter 35 miles in length, and both about 10 miles in greatest breadth. It is 65 miles in length (lat. 27°–27° 55' S.) by 23 miles in greatest breadth. Its shores are rich in soil, and admirably adapted for agriculture. Its appearance is very picturesque and beautiful by the numerous islands, some of them capable of profitable cultivation, which it is dotted over. Into this bay five navigable rivers, the Arrowsmith, Logan, Brisbane, and Caboolture pour their waters. The entrance at the north end is practicable at all times, and the vessels of the largest size; the entrance between Moreton and Stradbroke is narrow, and less so.

MORETON-BAY CHESTNUT (*Castanum australe*), a tree of the natural order Leguminosae, sub-order Papilionaceae, a native of Queensland.

## MORGAN—MORGHEN.

Australia. It attains a height of 70–100 feet, has wide-spreading branches, pinnate leaves, and large racemes of beautiful red and yellow flowers. The pods are six or seven inches in length, and the seeds are in size and quality somewhat like chestnuts.

**MORGAN, LADY (SYDNEY)**, was the daughter of a theatrical manager, named Owenson, who settled in Dublin. It is usually stated that she was born in 1786, but as she refuses to tell the date of her birth, 'because dates are so cold, false, and erroneous,' the reader of her autobiography will do well to add about ten years to her age. Her father fell into pecuniary difficulties, and the clever, bold, and lively young woman resolved to support the fortunes of the family, first as governess, and then as author. She wrote *The Wild Irish Girl* in 1806. A lady-novelist was then rare, and Irish subjects were less hackneyed than they have since become. Sydney Owenson obtained a footing in the household of the Marquis of Abercorn, in whose establishment her future husband, Dr Morgan, held the post of private physician. The Lord Lieutenant was persuaded to make a knight of Dr Morgan, and the newly wedded pair set up for themselves in Dublin. Here she wrote the *O'Donnel*. The opening of the continent in 1814 attracted the Morgans to Paris. Lady M. obtained admission into the highest society, corresponded with several celebrities, and wrote a work on *France*, which was eagerly received, and vehemently praised and censured by critics of different political opinions. In 1818, the Morgans went to Italy—the wife to sketch manners, scenery, and society, while Sir Charles was to contribute chapters on politics, science, and education. Lady M. was received with great hospitality by the Italian nobility, and the foreign visitors at Rome. Her *Italy* appeared in 1821, and proved one of the most successful and remunerative of her works. In 1824, the Morgans came to London, and in 1825, Lady M. began to keep a diary, which contains some amusing bits of literary, fashionable, and political gossip. Her reputation as an authoress became obscured, but she continued to the end of her career to assume the twofold character of the lady of fashion and the woman of genius. She succeeded in obtaining from the Whig government a pension of £300 a year, in acknowledgment of her literary merits, and partly, also, in recognition of the unjust and virulent attacks to which she had been subjected for having, in her earlier works, exposed the wrongs of her native country. She died in 1859, having continued busy with her pen and her tongue to the last; and leaving behind a great mass of correspondence of little intrinsic value and interest, which, with a memoir, her autobiography, and diary, was published in 1862, in 2 vols. Her descriptions of high life have much raciness and vigour, and her Irish sketches—the famous 'Jug-day,' in *The O'Briens* and the *O'Flahertys*, deserving special mention—are perhaps the best account of that rickety, humorous, sentimental existence which was at once the charm and bane of Ireland, and which has but lately passed away.

**MORGANATIC MARRIAGE** (Goth. *morgan*, to curtail, limit), sometimes called *Left-handed marriage*, a lower sort of matrimonial union, which, as a civil engagement, is completely binding, but fails to confer on the wife the title or fortune of her husband, and on the children the full status of legitimacy or right of succession. The members of the German princely houses have for centuries been in the practice of entering into marriages of this kind with their inferiors in rank. Out of this usage has gradually sprung a code of matrimonial law, by which the union of princes with persons of lower

rank, in other than morganatic form, involves serious consequences, especially towards the lady. The penalty of death was actually enforced in the case of the beautiful and unfortunate Agnes Bernauer (q. v.). In the 16th and 17th centuries, a fashion began among German princes of taking a morganatic wife in addition to one who enjoyed the complete matrimonial status—Landgrave Philip of Hesse setting the example, with a very qualified disapprobation on the part of the leading Reformers. An energetic attempt was made in the first half of the last century by Anton Ulrich, Duke of Saxe-Meiningen, to upset the established practice, and obtain for his morganatic wife the rank of duchess, and for her children the right of succession. In deference to the united opposition of the whole principedom of Germany, the emperor refused the duke's suit, declaring that there could be no marriage in princely families without 'Ebenbürtigkeit,' or equality of birth. In the present century, morganatic marriages are by no means on the decline among the German reigning houses—one of the best known and most remarkable instances being the union of the late Archduke John, the 'Reichsverweser' of 1848, with the daughter of the postmaster of Aussee, in Styria, afterwards created Countess of Meran. Morganatic marriages are recognised not only among the princely families, but among the higher aristocracy of the empire; and in Prussia, even the 'Niedere Adel,' or inferior gentry, may contract unions of this kind. A sort of left-handed or 'hand-fasted' marriage was recognised in early times in the Highlands of Scotland, and Ireland: the hand-fasted bride could be put away, and a fresh union formed, with the full status of matrimony. Unlike the case of German morganatic marriages, the issue were often accounted legitimate, even to the prejudice of the children of the more regular union that followed. The Royal Marriage Act, 12 Geo. III. c. 11, reduces to a position somewhat like that of morganatic unions every marriage in the royal family of Great Britain not previously approved by the sovereign under the Great Seal, provided the prince entering into it is under 25, and every such marriage of a prince above 25 which is disapproved by parliament.

**MORGARTEN**, a mountain slope on the east margin of Lake Egeri, in the canton of Zug, Switzerland, has acquired a world-wide celebrity as the scene of a great victory won by the Swiss Forest Cantons over the Austrians, 6th December 1315. The Swiss, who had command both of the narrow pass which wound between Morgarten Hill and the lake, and of the adjoining heights, numbered only 1400 men, while the Austrians amounted to 15,000, and were led by Duke Leopold, brother of the German Emperor. When the Austrian troops had fairly entered the pass, those of the Swiss posted on the rocks above hurled down great masses of stone, which threw the enemy's cavalry into confusion, besides killing immense numbers of them. Their comrades who held the pass, taking advantage of the disorder, now charged the Austrians repeatedly, and utterly routed them. Only a few escaped, among whom was Duke Leopold himself.

**MORGHEN**, RAPHAEL SANZIO CAVALIERE, a famous engraver, was born at Florence, June 19, 1758. His first instructor in the art of engraving was his father, who, according to some, was a German, or the son of a German. The indications of talent that he gave were such as to induce his father to place him under Volpato at Rome. His progress then became very marked. Raphael's celebrated figures in the Vatican of

## MOROCCO.

Muluya, with its tributary the Sharef, which drains the north-east of the country, and falls into the Mediterranean after a course of 400 miles; the Kos, Oom-a-beg, Bu-Regreb, Tensift, Suse, and Assaker, the last forming for part of its course the southern boundary of M., drain the central and western districts, and fall into the Atlantic; the Draha, Fileli, Ziz, and Gir, irrigate the dry plains of Tafiilet, and the first-mentioned then empties itself into the Atlantic Ocean. The subsequent courses of the other three rivers are not yet well ascertained.

The climate between the central range of Atlas and the sea is temperate, the thermometer seldom falling lower than 40° F., or rising above 90° F., owing partly to the regulating influence of the sea-breeze, and the shelter afforded by the mountains from the scorching winds of the desert; but in the south-east districts, extremes of heat and cold are said to prevail, and rain is there unknown.

Among the chief products of the country are wheat, barley, rice, maize, durra, and sugar-cane; and among fruits, the fig, pomegranate, lemon, orange, and date are common; while cotton, tobacco, hemp, &c., are largely produced both for home use and export. M. is supposed to be rich in mineral treasures; plentiful supplies of copper are obtained at Teseleht, near the source of the Assaker, and gold and silver occur in several places. Iron, antimony, lead, tin, and rock-salt, the last three in considerable quantity, are also found. Owing to the character of the country and its thin population (35 to the English square mile), M. is much infested with wild animals. Lions, panthers, hyenas, wild-boars, and various kinds of deer, gazelles, &c., abound in suitable localities, and occasional devastations are committed by locusts. Ostriches are found in Tafiilet. The Moorish horses, formerly so famous, are now much degenerated. The breeding of sheep, oxen, goats, camels, mules, and asses, forms an important item of national industry. Oxen and bulls are chiefly employed in field-labour.

The inhabitants, like those of Barbary in general, consist of Moors, Berbers, Arabs, Negroes, and Jews, with various intermixtures between these races. More than two-thirds of the population belong to the race commonly called Moors, the remaining third consisting mainly of Berbers or Amaziyehs (including the Berbers of the Riff Coast, and the Shelluhs of the Great Atlas); Jews, estimated at 340,000; and negroes. Very few Europeans reside in Morocco. The state of civilisation is very low, and many of the Amaziyehs are complete savages. Excepting the Jews and the few Europeans, the whole population is Mohammedan. Negroes are brought into the country as slaves from Sudan.

M. is divided into four territories—Fez, Morocco, Suse, and Tafiilet. For convenience of administration, the empire is subdivided into 33 governments or districts ('ammala'), each under the superintendence of a 'caid,' whose chief duty it is to collect the imposts; but the semi-independent tribes are ruled by their own chiefs, and scarcely acknowledge the authority of the sultan. The government is purely despotic, and in the absence of written laws, the will of the sultan and his subordinates decides everything. The public officials eke out their allowances by practising extortion on those under their charge, and are in turn plundered by their superiors. The sovereign of M., called by Europeans the Emperor of M., is known among his subjects as sultan, and assumes the titles of *Emir-ul-mumenin*, or 'Prince of the Believers,' and *Khalifeh-allah-n-chalkihi*, or 'Vicegerent of God upon Earth.' The title is hereditary in the male line, but does not necessarily descend to the eldest son.

Education consists in learning to read, write, and

recite portions of the Koran, and this quantum of education is pretty generally diffused among the people, but the art of printing is unknown, and the arts and sciences are at a very low ebb.

The only industrial arts prosecuted to any considerable extent are the manufactures of caps, furs, silks, and leather. In the production of this last, the Moors far surpass Europeans, and are able to render any kind of leather extremely soft and white, by the use, it is said, of two species of plants found in the country, and unknown to Europeans. They also excel in the production of brilliant colours in leather. The yellow leather is made in M. Proper, the green in Tafiilet, and the red in Fez. There is an important caravan-trade between M. and Sudan, and also with Mecca and the Levant. The principal exports are wool, hides, grain, cattle and sheep, leather, salt, &c.; and the imports, cotton, linen, and muslin goods, sugar, tea, coffee, hardware, gold-dust, indigo, ivory, &c. Mules, horses, and camels, form the internal means of transport. Much of the Arabian trade is carried on by coasting-vessels between Tangier and Egypt, as the carriage across the desert is very costly. At the present time, two-thirds of the entire trade of M. is in the hands of British merchants.

The army consists of between 15,000 and 20,000 men, of whom one-half are negroes; there is also a sort of militia, amounting to 80,000 or 100,000 men, which is occasionally called out. The navy is now insignificant; but in former times, especially in the 16th and 17th centuries, it was very formidable to the maritime powers of Europe, and was chiefly occupied in piratical expeditions. See RIFF.

The history of M. is, generally speaking, similar to that of the rest of Barbary (q. v.) down to the end of the 15th century. About that time, it was formed into a monarchy, and notwithstanding internal divisions, enjoyed considerable prosperity, and the confines of the empire were extended as far south as Timbuktu. This empire fell to pieces, and was succeeded in 1647 by that of the Sherifs of Tafiilet, who conquered both M. Proper and Fez, and united the whole country under one government. This is the present ruling dynasty. In the middle of the 17th c., the empire of M. embraced part of the present province of Algeria, and extended south as far as Guinea, where it came into collision with the Portuguese settlements. Since the commencement of the 19th c., the rebellions of the wild mountain tribes, the disturbances in Algeria, and difficulties with foreign states, caused by the aggressions of the Riff pirates, have greatly retarded the well-conceived measures of the various rulers for the development of the resources, and increase in civilisation of Morocco. In 1814, the slavery of Christians was abolished; and in 1817, piracy was prohibited throughout Morocco. In 1844, M. took part in the war of Abd-el-Kader against the French, in the course of which Tangier was bombarded and Mogadore occupied; but peace was concluded in the same year. In 1851 and 1856, complications took place with France concerning some French vessels which had been plundered by the Riff pirates, but in each case compensation was given by the sultan. In 1859, the Spanish government, smarting under a series of similar outrages, demanded compensation, and also an apology for an insult to the Spanish flag at Ceuta; and on the sultan's disclaiming all responsibility for these acts, war was declared by Spain, October 22, 1859, and a large force under Marshal O'Donnell invaded Morocco. Two battles were fought, several ports were bombarded, and Tetuan taken, and on March 25, 1860, the sultan yielded. A treaty was accordingly signed, April 27, 1860, by which the sultan ceded some portions

translate the Bible into it. He reached Canton in September 1807, and in the course of a year was appointed translator to the East India Company's factory at Canton. By the year 1814 he had completed the translation and printing of the whole of the New Testament. Four years later, by the help of Mr (afterwards Dr) Milne, he had done the same with the Old Testament; and in 1822, he completed and printed his great *Chinese Dictionary* at an expense to the East India Company of £15,000. In 1816, he acted as interpreter to Lord Amherst. In 1818, he established an Anglo-Chinese College at Malacca for English and Chinese Literature, and for the propagation of Christianity. After a residence of 17 years in China, he returned to England in 1824, and brought with him a collection of 10,000 books in the Chinese tongue. In 1826, he returned to China. In 1834, he accompanied Lord Napier to Canton as interpreter, and died there 1st August. Besides the works already mentioned, he is the author of *Horæ Sinicæ* (Lond. 1812), being translations from the popular literature of the Chinese; a *Chinese Grammar* (Serampore, 1815), and *Chinese Miscellany* (1825). In 1839, his widow published *Memoirs of the Life and Labours of Robert Morrison*.

**MORRISTOWN**, a village of New Jersey, United States of America, on the Whippany River, and the Morris and Essex Railway, 23 miles west of New York, on an elevated plain, commanding a fine prospect. It has a court-house, 2 banks, 7 churches, and several literary institutions. Pop. (1870) 5674.

**MORSE, WALRUS, or SEA-HORSE** (*Trichecus*), a genus of amphibious mammalia of the family *Phocidae*, agreeing with the rest of that family—the seals—in the general form of the body and limbs, but widely differing from them all in the head, which is remarkable for the enormous development of the canine teeth of the upper jaw, and the tumid appearance of the muzzle caused by the magnitude of their sockets, and by the thickness of the upper lip. These great canine teeth form two tusks directed downwards, and the lower jaw becomes narrow in front, so as to pass between them. There are no canine teeth in the lower jaw. The incisive

Morse (*Trichecus rosmarus*).

teeth are small, six in the upper jaw, and four in the lower, mostly disappearing from adult animals. The molars—at first, five on each side in each jaw, but fewer in the adult—are simple, and not large; they have the crowns obliquely worn. The nostrils, as if displaced by the sockets of the tusks, open almost upwards, at some distance from the muzzle. The eyes are small; and the ears have no auricle, or, in popular language, there is no ear.—There is only one known species (*T. rosmarus*), sometimes called the **ARCTIC WALRUS**, an inhabitant of the

Arctic seas and of the colder parts of the temperate zone. It sometimes attains a size than that of the largest ox, and the tusks at times two feet, or even thirty inches long; ordinary length of the tusks is only about . The M. is a gregarious animal, and is often great herds, which sometimes leave the rest for a while either on the ice or on the where, however, their movements are very and clumsy, and the hunter assails them with greater prospect of success than in the Hundreds have thus been killed at one time, the adventure is not without danger, as they be assailed with spears, their hide being enough to resist even a rifle bullet. The M. tusks for protecting itself or young from for combating with its enemy the polar-b aiding it in climbing upon ice; but principally is supposed, for tearing sea-weed from the rocks; that being, there is every reason to the principal food of the animal, although it is also to prey on molluscs, crustaceans, and marine animals. The female M. shews great for her young, and will defend it to extremity; the young also remains beside the even after she is killed. When one of these is attacked, the rest of the herd—at least if water—hasten to its assistance. The M. is capable of being tamed.—It is much sought by the inhabitants of the most northern parts of the world for its skin, thongs of which seem to have been generally used in former times for ropes and cables—esteemed so valuable, that the Finns paid tribute in this article; whilst its oil—so abundant—is employed like seal oil; and the tusks are very much valued as ivory, being superior in compactness to those of the elephant. The M. has not large tusks like the adult.

The M. has occasionally been seen on the British coasts, probably transported on icebergs from the north.

The name M. is from the Russian *Mors* or *Morsk*. The name *Walrus* is Norwegian (*Hval* Whale-horse). Another Norwegian name is *Ras* supposed to be from the Teutonic *ros*, horse, *mar*, the sea.

**MORSE, SAMUEL FINLEY BREESE, LL.D.** American artist and inventor, was the eldest son of Rev. Jediaiah Morse, D.D., geographer, and born at Charlestown, Massachusetts, April 27. He graduated at Yale College in 1810, and went to England with the American painter Washington Allston, to study painting with him and Benjamin West. In 1813, he received the gold medal of the Adelpi Society of Arts for his first effort in sculpture, the 'Dying Hercules.' Returning to New York in 1815, he became the first president of the National Academy of Design, and was appointed Professor of the Arts of Design in the university of the city of New York. He did not give his attention to art, but was interested in chemistry and especially in electrical and galvanic experiments; and on a voyage from Havre to New York in 1832, he conceived the idea of a magnetic telegraph, which he exhibited to congress in 1837, and vainly attempted to patent in England. His claim to priority of invention over Professor Wheatstone in England have been the subject of considerable controversy. See TELEGRAPH. He struggled with scanty means until 1843, when, as he almost yielded to despair, congress, at midnight and the last moments of the session, appropriated 30,000 dollars for an experimental line between Washington and Baltimore. For his telegraphic inventions, M. was rewarded by testimony

# MORSHANSK—MORTALITY.

s, orders of nobility, and wealth. Several an states joined in presenting him a purse 000 francs, and banquets were given him in and Paris. The recording instrument in America is his invention.

RSHAN'SK, a district town in the centre of ernment of Tambof in European Russia, 56 orth of Tambof, is situated on the left bank of a, a feeder of the Oka. Its population in 1867 819. M. is the port for shipment of the corn provinces, of Simbirsk and Saratof, the ship- annually amounting in value to 5,000,000

There is also a large market for the cattle eep of the south-east provinces, the average supply being 20,000 cattle and 100,000 also for melted grease, of which 1,500,000 worth is sent yearly to St Petersburg and r. The trade of the town itself is of little nce, the chief establishments being soap- s, flour-mills, and sailcloth manufactories.

RTALITY, LAW OF. While there are few vents the date of whose arrival is more in than that of death to any one man, on the and, the average duration of a multitude of lives is found to be in accordance with a ich operates as surely as that of gravitation. asked how many lives must we have, before depend on obtaining from them a duration o the general average, the only answer that given is, that the more we have the more must we approach to this result; the fluc- ultimately becoming so small as to be prac- of no effect. So long ago as early in the a certain John Graunt of London published e called *Natural and Political Observations ills of Mortality*. This work has been called rliest movement in economical arithmetic, e closest approximation to the data on which urance is founded.' About the same time, liam Petty gave to the world many curious ions and speculations on the same subject. t, Dr Halley published the Breslau tables of ty, and this was the first work which really the subject to the rank of a science. s speculations had, however, been preceded e of Pascal in France, and of De Wit in l; and the latter famous man is probably l to be considered as the first who has the doctrine of probabilities to the valuation in the question of annuities. His treatise found in the second volume of the *Assurance ne*. Halley's tables are printed in the *Phil- ol Transactions* for 1693, No. 196. In 1713, ouilli's important work was published; and , Dr Price, availing himself of the principles wn by Halley, and of data previously pub- y 'John Smart of Guildhall, London, Gent.' ibles of mortality for London. In 1746, M. ieux published at Paris his *Essai sur les illits de la Vie Humaine*, in which he gave uable tables. In one of these, computed e registers of different religious houses, it own, for the first time, that female life is r to male. In 1770, appeared the first edition e's *Observations on Reversionary Payments*. eulations of Buffon, Simpson, and De Moivre the same time were of much importance. ty tables are tables shewing the operation of of mortality. The correct method of fram- is by analysing and collating accurate and ntly extensive statistics of life and death. enable us to form a fair estimate of the e of human beings who will die at the end of period out of a given number alive at the ing of it; and hence, the chance of life and

death to the individual, and the mean duration of life at any age. Tables shewing the mean duration of life have been constructed in two ways: 1st, From statistics of deaths alone; and 2d, From statistics of life and death. By the first plan, they would be deduced as follows: Suppose, on searching a parish register, that we found recorded 100 deaths of children in their first year, we should assume that, on an average,  $\frac{1}{4}$  a year of life would have fallen to each. This gives 50 years of life among 100. If we found that 60 had died in their second year, assigning one year and a half to each, we should have  $60 \times 1.5 = 90$  years among the 60; and so on for every age up to the oldest on the register. The sum of all the years enjoyed, divided by the numbers who have enjoyed them, will give the mean duration of life from birth; and the sum of all the years enjoyed after a given age, divided by the numbers who have enjoyed them, will give the mean duration at the given age; in both cases as nearly as the data enable us to give it; but the data are insufficient. Suppose we found by a register for 1873 that 100 children had died in their first year and one man in his 96th, it is plain that, to make this ratio a fair one, there ought to have been as many births in 1778 as in 1873. If there have been only half as many born at the former date as at the latter, then we must put two lives into the calculation to make it correct; and we must proportion our results similarly at all intermediate ages. Again, suppose four deaths at age 23 to be registered, we cannot tell how many of those born in 1850 may have emigrated from one parish; nor do we know how many born elsewhere in that year may have come into it. For the rule and formula for obtaining the mean duration of life under the second method, which is an absolutely certain one, see LIFE, MEAN DURATION OF. The following are the tables now most generally used by assurance and annuity offices in this country: I. The Northampton (Dr Price's). This table was framed by Dr Price from the register of burials in the parish of All Saints, Northampton, 1735—1780. Being constructed on deaths alone, it has, as was to have been expected, proved faulty. It gives the probabilities of life too low at the younger and middle ages; and those offices which still use it—and there are a good many—have some difficulty in keeping themselves right. II. The New Northampton (Nos. 1 and 2). These tables were constructed by Dr Farr. See Eighth Report of the Registrar-general for England, pp. 277—348. No. 2 is based on the deaths alone in Northampton during the seven years 1838—1844. In its results it agrees almost exactly with that of Dr Price. No. 1 was deduced from a comparison of the deaths during 1838—1844 with the census returns of 1841. It differs widely from No. 2 and from Dr Price. By the two latter, the mean duration of life is respectively found as 24.88 years and 25.18 years. By No. 1, it is 37.5 years. III. The Carlisle. This table was constructed from observations made by Dr Heysham at Carlisle, 1780—1787. It is now generally understood that the mortality in towns is understated at ages 15—35, owing to the immigration of healthy men and women from the country. Again, the female population of Carlisle was excessive during the period in question, and the extent of the observations was limited. Owing to these facts, this table gives rather too low a rate of mortality, and is a little irregular in its graduation. In a table prepared by W. T. Thomson, Esq., in a Report on the Ministers' Widows' Fund of the Church of Scotland, 1861, he shews that the lives of the Scotch clergy are about half a year better up to 44 than the Carlisle; at 45, they are equal; and at 45 to 80, they are half a year

# MORTALITY.

worse. Thereafter they vary. The widows are half a year better up to 61, equal at 62, and nearly so to the end. Probably the Carlisle gives a fair mortality rate for a healthily circumstanced population. IV. The Government. These were computed by Mr Finlaison on the lives of 22,000 nominees for government annuities. They are chiefly important as giving a view of the value of female life, but this view is one which differs widely from those given either by the 'Experience' or by the 'English' table. At age 20, for instance, the mean duration of female life is, by the Government table, 5½ years more than the male; by the Experience, it is 4 years less. In some measure this wide divergence may perhaps be accounted for by the fact that the Government results are deduced from annuitants, the Experience from assured lives. The experience of late years has, however, led to some modification in the relative values of male and female life in government tables. V. The English (Nos. 1, 2, and 3). No 1. is deduced from the living by the census of 1841, and from the deaths at corresponding ages in the same year. See 5th and 6th Reports of the Registrar-general for England, where the tables will be found, and their construction explained. No. 2 is deduced from the living in 1841, and from the deaths in the seven years 1838—1844. No. 3 is deduced from the population in 1841 and in 1851, and on the deaths for the 17 years 1838—1854; male and female life being calculated separately and in combination. These 'English' tables probably give the results of the average mortality of England more correctly than any others which we have. They are the result of enormous labour on the part of Dr Farr. The observations were taken on the plan recommended by Professor de Morgan and Mr Griffith Davies. VI. The Experience. These were prepared by a committee of eminent actuaries on the data afforded by the combined experience of 17 life-assurance offices. The objections to which they are liable are, that certain lives having been more than once assured have appeared twice or oftener as elements in the calculations; that the average term over which the observation of the offices extends is only eight and a half years; and it is probable that the mortality which will prevail in assurance societies when they have reached maturity is somewhat understated. See letter by Dr Farr in Appendix to 10th Report of Registrar-general, p. 11. Further, the data for old ages were deficient, and this of course affects the whole. Many curious results are brought out by

this table. It shows that 'town' assured superior to 'country'; that female assured life the whole inferior to male; and that Irish worst of all. At age 20, 'town' mean duration 41 years, 2 months; country, 40 years, 4 months; Irish, 34 years, 11 months. The observations of the Standard Assurance Company do not, however, bear out these results; and they are doubtless largely affected by the elements of *Care* as to render it impossible to found on any conclusion of practical value. A new 'Experience' tables was published in 1872, on the mortality experiences of twenty or ten English and ten Scotch. They do not show any widely different results from the former Experience tables. These form a very valuable set of tables. They give the results of English and Scotch experience united, and of Scotch separately. In all tables deduced from the experience of assurance and annuity societies, the fact of selection must not be lost sight of, either in using them for the sake of comparison, or as the basis of calculations. Actuaries, however, seem to be generally of opinion that the selection exercised by assurance societies does not really lower their rates of mortality below the general average; without selection their rate would be above the general mean; and it will be observed, that the public are continually selecting against the offices by offering inferior and good lives often surrender their policies, and lives which have become bad hardly ever do. Again, the value of medical examination gradually disappears, and in ten years at most it is lost. Five to seven years is indeed now held by the assurance offices to exhaust its value. Minutes of the House of Commons' Committee on Assurance Associations, 1853; and Life-Office Agency Tables by E. J. Farren, pp. iii.—Though female life is, as a whole, undoubtedly superior to male, yet as there are more critical periods in it, it is probable that the public more frequently select it than male life against assurance societies. A valuable report on the Madras Sundry Fund (London, 1863) gives tables constructed on the mortality rates prevailing among the officers' wives, and widows interested in the fund. As these have been prepared by eminent men on very accurate data, they will probably be very valuable to those transacting business in India. The following view of the mean duration of life, at the beginning and at each decennial period, according to the tables mentioned above:

In the present article, we have considered the law of mortality, chiefly as it bears on insurance and other monetary transactions. The wider view of the subject, as varying with occupation and

## MORTAR—MORTAR-VESSEL.

different ages and countries, will be illustrated under the head of VITAL STATISTICS.

**MORTAR.** See CEMENTS.

**MORTAR**, a piece of artillery which differs from a cannon in the large diameter of its bore in proportion to its length, and in the circumstance that it is usually fired at a considerable angle, so that the projectile may strike the object aimed at in a

13-Inch Mortar, with Loading Apparatus.

direction more or less vertical. The object for which mortars are intended is the discharge of Live SHELLS (q. v.) or carcasses. As the projectile has a large diameter, and, except in rare instances, a very great range is unnecessary, a comparatively small charge of powder is requisite. To give this its utmost power and concentration, it is confined in a hemispherical chamber at the lower end of the bore, but of less diameter. The shell completely closes this chamber; and when the explosion ensues, receives its full force on its centre. In the British service, the ordinary mortars range in diameter of bore from 5 to 13 inches. The 13-inch mortar is shewn in the annexed figure.

Larger mortars have, however, been tried at times, as at the siege of Antwerp Citadel in 1832, when the French brought one of 24-inches bore to the attack. This monster, owing to its unwieldiness and other causes, was a failure. Larger still than this, though perhaps more manageable, is Mr Mallet's great 36-inch mortar, constructed in 1855, of iron parts welded together, and now at Woolwich, rather as a curiosity than for use. As loaded shells are of immense weight, so heavy, indeed, as in larger calibres to involve the apparatus depicted in the fig. to deposit them in their places, and the mortar is fired at high elevations, the recoil is so great and so nearly vertical that no carriage could withstand the shock; it is necessary, therefore, that the mortar should be mounted on a solid iron or timber bed, by the trunnions, which are placed behind the breech, and supported in front by massive blocks of wood. This arrangement renders the apparatus so heavy that mortars of large size are rarely used in field operations, their ordinary positions being in defensive or siege works, and in mortar-vessels.

More wieldy, however, are the Coehorn mortars, invented by the Dutch engineer of that name, for clearing the covert-way or ditch of a fortress. This mortar is sufficiently small to be managed by one man, and is accounted useful in siege or defence operations. The French use a similar Lilliputian ordnance under the denomination of *pierriers* or stone-throwers. Small mortars are likewise constructed for mountain warfare: a mule carries the mortar, another the bed, and a third is laden with the projectiles. The use of mortars is diminishing at the present time, elongated shells of great weight being now thrown from rifled cannon.

**MORTARA, EDGAR**, a Jewish boy, whose case recently attracted great and painful interest throughout Europe. The facts are as follows: On the 23d of June 1858, Signor Momolo Mortara, a manufacturer and wholesale merchant of cloth in Bologna, and by religious profession a Jew, returning home about ten o'clock at night, found his house in the possession of the police, who informed him that they

had orders from Padre Felletti, inquisitor-in-chief at Bologna, to carry off his son, Edgar, who had been surreptitiously baptized into Christianity by a Roman Catholic maid-servant. The inquisitor was waited upon by some friends of the family a little after midnight, who implored delay. He informed them that he was acting under the orders of the Archbishop of Bologna, but consented to sist procedure till 'next evening.' The archbishop, however, was 'absent' from the city, and next evening the papal carbiniers entered the house and 'tore the child out of his father's arms.' They carried him to Rome, where he was immured in a convent. The bereaved father immediately followed, obtained several interviews with Cardinal Antonelli, and offered to prove that the servant who said she had baptized Edgar had turned out to be a worthless prostitute, living in sin with Austrian officers. The cardinal declined to interfere, on the ground that the case did not come under his jurisdiction, and recommended Signor Mortara to apply to 'the proper tribunals.' After some weeks had passed, the child was removed to Alatri, whither his father and mother also went, and saw Edgar in a church among a number of priests, but had no opportunity of speaking to him. They returned to Rome, once more sought the presence of Cardinal Antonelli, and prevailed upon him so far that he ordered the child to be brought back to the city, and allowed his parents several times to converse with him. These interviews are described as agonising, and Edgar earnestly entreated his father and mother to take him home, but this of course was a hopeless request. He had been baptized, and baptism, no matter by whom administered, was an inviolable rite, which laid the Catholic Church under the solemn obligation of protecting its son from the snares of parental infidelity. It dared not give him up. Signor Mortara and his wife had to go away without their child. The case soon became known throughout Europe, and excited great indignation, more particularly in England. The Evangelical Alliance drew up a protest, which was signed by the Archbishop of Canterbury and above twenty other bishops, by a large number of peers, members of parliament, heads of colleges, and ministers of the gospel, by upwards of a hundred mayors and provosts, and by many other influential laymen. It was presented to Lord John Russell. The British Jews presented another. Nothing, however, has as yet been effected by their efforts. Edgar Mortara is still in the hands of the church-authorities. When Bologna, along with the greater part of Italy, passed under the sway of Victor Emmanuel in 1860, the inquisitor, Felletti, was arrested and thrown into prison. His trial, however, so far as we know, has not yet come off.

The above narrative, it is to be observed, can only be received as an *ex parte* statement; no authorised exposition of the facts, on the part of the Roman authorities, having as yet, we believe, been made public in these countries.

**MORTAR-VESSEL**, a class of gun-boat for mounting sea-service mortars, and in some cases provided with steam-power. The mortars are usually of the largest calibre, 13-inch. To enable the mortar to be properly manœuvred, and to resist the recoil from the nearly perpendicular explosion of so great a piece of ordnance, the vessel has considerable breadth in proportion to her length. The mortar is slung amidships in a massive bed. The ancient form of mortar-vessel was the 'bomb-ketch,' convenient because of the length of deck without a mast. The present vessels originated during the Russian war, and were found serviceable at the bombardment of Sveaborg.

interest to the donor; it must be done at once and ever. The policy of this statute has sometimes been questioned, and several well-known modes of doing the statute have been adopted from time to time. The act has been held to apply only to land actually situated in England; and hence, if the land is situated in Scotland, or the colonies, or abroad, a bill conveying it for charitable purposes will receive effect. In Scotland, the mortmain act had no application; but it was not needed, as the common law in Scotland also put a similar check on the alienation of land on death-bed, which, however, has been abolished by statute. See DEATH-BED, INTEREST.

**MORTON, SAMUEL GEORGE, M.D.**, American physician and ethnologist, son of an Irish emigrant, was born in Philadelphia, January 26, 1799. He studied medicine in Philadelphia, Edinburgh, and Paris, and in 1824 settled in Philadelphia, where he contributed papers on physiology and zoology to scientific journals. In 1834, he visited the West Indies, and made observations on the development of races. In 1839, he was jointed Professor of Anatomy in the Pennsylvania Medical College, and published his great work, *Crania Americana*, based on his collection of 867 classified skulls. In 1844, he published *Monia Egyptiaca*, based on the collection of George R. Gliddon, Esq.; and in 1849, his last work, *Illustrated System of Human Anatomy, Special, General, and Microscopic*. He died at Philadelphia, May 15, 1851. M. may be regarded as the first American who endeavoured to place the doctrine of the original diversity of mankind on a scientific basis. See the Memoir of M. prefixed to Nott and Gliddon's *Types of Mankind* (Philadelphia, 1854), a work largely illustrated by selections from his edited papers.

**MORTON, FOURTH EARL OF (JAMES DOUGLAS)**, 1st Earl of Scotland, was the second son of Sir George Douglas of Pittendreich, and in 1553 succeeded, in right of his wife, Elizabeth, daughter of the third earl, to the title and estates of the dukedom. He early favoured the cause of the Reformation, and in 1557 was one of the original members of the Congregation. Sworn a privy councillor in 1561, he was appointed Lord High Chancellor of Scotland, January 7, 1563. Having been one of the chief conspirators against Rizzio, the Italian secretary of Queen Mary, on his assassination, 9th March 1566, he fled with his associates to England, but, through the interest of the Earl of Bothwell, soon obtained his pardon from the queen. Though privy to the design for the murder of Bothwell, on the marriage of the queen to Bothwell, he joined the confederacy of the nobles against her. He was present at Carberry Hill, when Bothwell fled from the queen, and after Mary's imprisonment in the Castle of Lochleven, he was restored to the office of High Chancellor, of which he had been deprived, and constituted Lord High Admiral of Scotland. On the death of the Earl of Mar, in October 1572, he was elected regent of the kingdom. His rapacity and avarice made him obnoxious to many of the nobles, and as the young king, James VI., desired to assume the reins of government, Morton resigned the regency in March 1581. Subsequently obtaining possession of the title of Stirling, with the person of the king, he overrode his authority, but was accused of participating in the murder of Darnley, and being tried and condemned, was beheaded at Edinburgh, June 1581.

**MOSAIC**, the art of producing artistic designs by setting small square pieces of stone or glass of

different colours, so as to give the effect of painting. Both the origin of the art, and also of its name, are buried in obscurity; it was, however, much practised by the ancient Romans, especially for ornamental pavements, specimens of which are almost always found whenever the remains of an old Roman villa are discovered. Under the Byzantine empire; it was also much used for the ornamentation of churches, in which it formed a large portion of the wall-decoration. It was re-introduced into Italy for the latter purpose about the middle of the 13th c. by Andrea Tafi, who learned it of some Greek artists employed at Venice in decorating St Mark's. Since then it has been especially an Italian art, and to such wonderful perfection has it been brought, that most minute pictures are produced by it. Within quite recent years, mosaics of surpassing beauty, both in design and material, have been produced by Russian artists in the Imperial Glass Manufactory of Russia; those shewn in the Russian department of the International Exhibition (1862) have probably never been surpassed. The pieces of glass of every shade of colour are technically called *smalts*; they are generally opaque, and are set in cement in the same manner as tiles or pavement. Some fine pieces of mosaic pavement have lately been produced in this country by Messrs Minton & Co. of Stoke-upon-Trent, and by Messrs Maw of Brosely, proving that the art only wants sufficient encouragement to obtain a high position. In Italy there are two very distinct varieties of mosaic work—i.e., the Florentine and the Roman; the former is entirely formed of pieces of stone or shell of the natural colours, and is limited in its application chiefly to floral and Arabesque designs. The latter is made of the glass *smalts* mentioned above, and has so wide an application, that most of the finest paintings of the best old masters have been copied in mosaic, and the pictures so taken form the almost imperishable decorations of the finest churches of Italy. The manufacture of the opaque glass or *smalts* for making the little square pieces called *tesserae*, of which the pictures are composed, is a very important one, and is, or used to be, carried on in the Vatican, where, of the various kinds of coloured glass, no less than 25,000 shades are produced. Great patience and skill are required in mosaic works.

**MOSAIC GOLD.** See TIN.

**MOSCOW**, an important government of Central Russia, lies immediately south of the governments of Tver and Vladimir. Area, 12,552 square miles; pop. 1,678,784. The surface is level, with the exception of a tract in the south-west, which is elevated. It is watered by the Moskva and the Kliazma, while the Oka forms a portion of its southern boundary. The soil, principally clayey, with some sandy and stony tracts, is, on the whole, unfertile, and barely supplies local consumption. Few of the governments of Russia, however, equal that of M. in manufactures and general industry. It contains numerous cloth, silk, brocade, chintz, paper, and other factories. China-ware is manufactured from the clay dug up in the district of Gjelsk. Many of its villages carry on special branches of manufacture, of which pins, glass beads, and small looking-glasses for Asia is one. White limestone is quarried, and is much used for building in the capital; yellow marble quarries occur on the banks of the Oka. Peat is extensively used as fuel in the factories. Among the places historically celebrated are the monastery of St Sergius, founded by one of the first Muscovite princes, and famous for its silver shrine, said to be the richest in the world; and the village of Borodino (q.v.).

placed at frequent intervals; the Romanzoff Place, formerly so dirty, has been converted into a splendid square, with an ornamental garden, and the old obelisk, the former monument of the Place, standing in the centre, with water fountains on each side. The general view of the town, especially that obtained from an eminence on its southern side called the Sparrow Hills, is eminently original and picturesque. Its hundreds of churches and convents, surmounted by gilt or variously-coloured domes; its gardens and boulevards; and, above all, the high walls and crowded yet stately towers of the Kreml or citadel, produce a most striking effect. The Kreml, situated on the northern bank of the river, forms the centre of the town, and around it, with a radius of about a mile, is a line of boulevards, extending, however, only on the north side of the river. Outside of this line, and concentric with it, is another line of boulevards, with a radius of a mile and a half; while beyond all, and forming the girdle of the city, is the outer rampart, with a circumference of 26 English miles. The Kreml comprises the principal buildings, as the Cathedral of the Assumption of the Virgin, founded in 1326, a small but gorgeously-decorated edifice; the Cathedral of the Archangel Michael, containing the tombs of all the Czars down to the time of Peter the Great, who changed the royal burial-place to St Petersburg; the Church of the Annunciation, the floor of which is paved with jaspers, agates, and carnelians of various shapes; the tower of Ivan Veliki, 200 feet in height, and surmounted by a magnificent gilded dome, from which, as from all the domes of M., rises the 'honourable cross;' the Czar Kolokol (king of bells), the greatest bell in the world; several palaces, and collections of ancient arms and other antiquities; the arsenal, surrounded by the splendid trophy of 850 cannons, taken from the French; and the senate. The walls of the Kreml are surmounted by 18 towers, and pierced with 5 gates. In the town, the chief buildings are the cathedral of St Vassili, remarkable for its peculiar architecture; the Gostinoy Dvor, or Bazaar; and the Exchanges. The Temple of the Saviour, which was commenced in 1812, to perpetuate the memory of the repulse of the French invasion, is not yet completed; but when finished it will be a magnificent architectural feature of this

centre. The chief manufactures are of the worsted goods, silks, brocades, dyes, tanning and skin-dressing, iron, copper, and chandlery.

M. is of ancient origin for a Russian site was bought by Yuri Dolgoruki and a fortress built. In the 14th century it became the capital of the Russian Empire, owing to the residence there of the Grand Duke, but it had also become the actual capital. In 1368, 1370, and 1372, it was sacked by the Lithuanians; in 1381 by the Tartars. From 1415 to 1450, it was four separate occasions, partially destroyed and it was burned to the ground by Khan of the Crimean Tartars, in 1610, and repossessed till their expulsion by the Minin and Pojarsky in 1612. In 1698, it was the theatre of the revolt of Peter the Great. In 1812, from the 14th September to the 19th October, it was in the hands of the French.

MOSELLE was formerly a department in the north-east of France, but part of it was taken by Germany in 1871-1872. The small portion which remained was joined to the department of Meurthe-et-Moselle (1872) 365,137. It is the Moselle and its tributaries; is fertile and yields abundance of grain, fruit, though the last is of an inferior quality. Culture is in an advanced condition. Numerous, and the river-navigable. Coal, iron, and building-stone are abundant minerals. There are also leather, glass, papier-mâché, and manufactures.

MOSELLE (Lat. *Mosella*), an affluent of the Rhine, rises in the Vosges Mountain range, at an elevation of about 2260 feet above the sea, not far from the sources of the Moselle. Its course is north-westerly as far as it is in the department of Meurthe-et-Moselle, where it is navigable; then north to Thionville, on the frontier; after which it proceeds, in a westerly direction (latterly, with many zig-zag windings), through Luxemburg and

## MOSES.

MOSES (Heb. *Môshêh*; LXX. and Vulg. *Moysees*; *pt. Mes* or *Messou*; *Copt. Mo-ushe*, i.e., drawn out of water), prophet and legislator of the Israelites, about 1600 B.C. in Egypt (? Heliopolis), during period of their hard bondage. His father was Amram, his mother Jochebed, both of the tribe Levi. The tale of his birth and early education by tradition (Manetho, Philo, Josephus, Midrash, &c.), received a much more extraordinary and dary character than is found in Exodus; while main features are, on the whole, the same in all. And there is no reason to doubt the fulness of an account which shews us M., like other supreme benefactors and 'sons' of God, struggling against an apparently adverse may for very life, from the instant of his birth. The well-known narrative, to which late traditions added in Philo, Josephus, the Fathers, &c.) supplied questionable names and dates, is that his mother, unable to hide the child—which was to have been drowned at its birth—longer than for space of three months, put it into a basket of papyrus, and hid it among the Nile rushes. Miriam, his sister, watching it from afar. The king's daughter (Thermuthis, or Meris?), coming down to the river, observed the weeping child, and was so struck with its beauty, that she allowed Miriam to take a Hebrew nurse, Jochebed. Grown up, he was taken to the king's palace (Heliopolis) as the adopted son of the princess, and here seems to have enjoyed not only princely rank, but also a princely education. He was also said to have become a priest, under the name of Osarsiph or Tisithen, and to have been highly adept in all the sciences of 'Egypt, Chaldea, and Chaldea'; to have led Egyptian armies against the Ethiopians, defeated them, and pursued them to their stronghold, Saba (Meroe); this place he delivered into his hands by Tharbis, the daughter, whom he subsequently married. The Bible contains nothing whatever about the life of his youth. He first reappears there as the avenger of a Hebrew slave, ill-treated by an Egyptian overseer. Threatened by the discovery of his bloody act, he escapes into Midian, where he is hospitably received by Jethro, the priest, and his daughter, Zipporah. He stayed for seven years in Midian, tending the flocks of his father-in-law. This most sudden transition from a brilliant and refined life of an Egyptian court, which he had been brought up a prince, to the life of a poor, proscribed, exiled shepherd, together with the influences of the vast desert around him, and, in M.'s mind, have produced a singular revolution. The two names which he gave to his sons, Gerson and Levi, strongly express part of what filled his soul—a sense of gratitude for his salvation from the grasping hand of justice, and the deep woe of his people. The fate of his brethren went now to his heart with greater force than when he was a prince near them. There rushed upon his memory the ancient traditions of his family, the promises of Jehovah to the mighty sheikhs, his forefathers; they should become a great and a free nation, and possess the ancient heritage of Canaan; should not he be the instrument to carry out this promise? The *Ehye asher Ehye* (I am that I am) appeared to him while his mind was occupied with such thoughts, and himself put the office upon his shoulders. A new king had succeeded in Egypt, his old enemies were either dead or had forgotten him, and M. returned to Egypt. Together with Aaron, his brother, the man of small energy of fine tongue, he consulted about the first steps to be taken with the king as well as with their own people—both of whom treated them at first with suspicion, nay, with contempt.

After ten distinct plagues (more or less akin to natural phenomena peculiar to Egypt), the last being the death of all the firstborn, Pharaoh consented to let his slaves go free, 'that they might serve their God.' M. very soon had occasion to prove that he was not only the God-inspired Liberator of his people, who, in the enthusiasm of the moment had braved the great king and his disciplined armies, but that he possessed all those rarer qualities which alone could enable a man to mould half-brutalised hordes of slaves into a great nation. Calmness, disinterestedness, patience, perseverance, meekness, coupled with keen energy, rapidity of action, unflinching courage—'wisdom in council and boldness in war'—constituted the immense power which he held over the hundreds of thousands who knew no law in their newly-acquired liberty, and who were apt to murmur and to rebel on any or no provocation. Nor were the hostile Bedouin tribes, whose territories the new emigrants approached, easily overcome with untrained warriors, such as formed the ranks of M.'s army. The jealousy of certain elders fostering seditions within, added to his unceasing vexations; and to fill the measure to overflowing indeed, his own brother Aaron, whom he had made his representative during his temporary absence on the Mount of Sinai, himself assisted in the fabrication of an idol. His sacred office as legislator he in reality first assumed in the third month after the Exodus, when, after many hard and trying marches and countermarches—from Goshen to Succoth (? Latopolis, the present Old Cairo); thence, by a detour, to Etham (? Ramlieh), Pi-hachiroth (? Bedea), through the Red Sea, to the Desert of Shur (? Al-Djofar), Marah, Elim (Wadi Gharandel), Desert of Sin (Wadi Mocatteb, or Wadi Al-Sheikh), Dophka, Alus, Raphidim (near the Makkad Sidna Mousa)—made more trying by want of food and of water, by encounters with Pharaoh and the Amalekites, having arrived near the Mount of Sinai, he made the people encamp all round, and ascended the summit of the mountain by himself. On the incidents connected with the 'Revelation' made to the whole people, we need not dwell any more than on any other part of this well-known narrative. Suffice it to point out briefly, that the tendency of the whole Law was to make the Hebrews a people 'consecrated to the Lord,' 'a holy people, and a kingdom of priests,' i.e., a people of equals both before God and the Law. Three distinct parts compose this Mosaic Constitution. The doctrine with respect to God and His attributes; the 'Symbolical' Law, as the outward token of His Doctrine; and the Moral and Social Law. The Decalogue forms a kind of summary of all the three: the existence of Jehovah as the Absolute Being, the liberation of the people and the prohibition of Polytheism, and the Representation of the Divinity by visible images (i.—iii.). While the institution of the Sabbath, the symbol of creation and the Creator, forms the basis of all religious observances (iv.), the remaining part of the laws relate to the intercourse among the members of the human commonwealth; the gratitude of children is inculcated; murder, adultery, theft, false witness, coveting of others' goods are prohibited. The groundwork of these regulations had indeed been a special inheritance in the family of the Abrahamites from the earliest times; but the vicissitudes of fortune, the various migrations, and the enormous increase of this family, and its being mixed up for long years with the surrounding idolaters, had obliterated nearly all traces of the primeval purity of creed in the populace. The wisdom displayed even in the minor regulations of the Mosaic dispensation, with respect to their adaptation

to the peculiarity of the race, the climate, the political state of the country which they were to inhabit; in the hygienic regulations, and the rules which treat of the social and domestic relations; and, above all, the constantly-reiterated caution from mixing again with other nations, such as they found them in Canaan—and the neglect of which subsequently proved their ruin—is traced to a direct influence of Jehovah, generally indicated by the words, 'And God spake to Moses, speak unto the children of Israel.' An ample Ritual, in connection with the Tabernacle, or constantly-visible symbol of a Divine Dwelling; the allegory of an ever-new covenant represented by Sacrifices, Prayers, Purifications, kept the supreme task of being priests and a holy people unceasingly before the eyes of the nation. The tribe of Levi (q. v.), to a certain degree acted in this respect as permanent representatives; and not to Moses's sons, but to his brother Aaron and his descendants, was intrusted the office of High-priest.

When on the eve of entering into the promised land, the people broke out in open rebellion, and threatened, by a spontaneous return to the land of slavery, to undo the entire work of M.'s life. Convinced that they were not as yet fit to form a commonwealth of their own, the Liberator and Lawgiver had to postpone, for the long space of 40 years, the crowning act of his work; and, in fact, did not himself live to see them taking possession of the hallowed territory. How these years of nomadic journeying through the Desert (El-Tyh or Al-Tyh Beni-Israel) were spent, save in rearing up a new generation of a more manly and brave, as well as more 'civilised' stamp, we can only conjecture. All those who had left Egypt as men were doomed to die in the desert, either by a natural death, or by being suddenly 'cut off,' in consequence of their openly defying M., and through M., Jehovah. The apparent lack of incidents during this period has indeed furnished grounds for various speculations on this subject, and critics have tried to reduce it to a much shorter space, without, however, being able to prove their point. Even Goethe, with more ingenuity than knowledge of the subject, has endeavoured to prove the 'forty' to be a mythical round number, the real time being two years. The testimonies of the Hebrew prophets and historians, however, are perfectly unanimous on the subject (cf. Jos. v. 6; xiv. 10; Amos, ii. 10; v. 26; Ps. xcv. 10, &c.), and modern criticism has mostly endorsed the number as in keeping with the circumstances. On the first month of the fortieth year after the Exodus, we find M. at the head of an entirely new generation of Hebrews at Kadesh, in the Desert of Phoran or Zin. Here his sister Miriam died. Here also, for the first time, M., seeing the new generation as stubborn and 'hard-necked' as their fathers, is recorded to have despaired of the Divine Providence; and his disobedience to the letter of the command given to him, 'to speak to the rock,' is alleged as the reason 'that his bones too had to fall in the desert.' His brother Aaron died at Hor (near Petra, according to Josephus and St Jerome), whither the Israelites had gone next. Not long afterwards, M. once more had occasion to punish with relentless severity the idolatrous tendencies of the people (Baal Peor), thus shewing that age had had no power of making him relax his strong rule over the still half-savage and sensuous multitude. Having finally fixed the limits of the land to be conquered, and given the most explicit orders to Joshua, to Eliezer, and the chiefs of the ten tribes, respecting its division, he prepared the people for his own impending death. He recalled to their minds in the most impressive language, their mira-

culous liberation, and no less miraculous preservation in the desert. Their happiness—their life—was bound up, he told them, in the Divine Law, communicated through him by Jehovah. A recapitulation of its principal ordinances, with their several modifications and additions, and reiterated exhortations to piety and virtue, form the contents of his last speeches, which close with one of the grandest poetical hymns. The law was then handed over to the priests that they might instruct the people in it henceforth; Joshua was installed as successor (while his own sons sunk into the obscurity of ordinary Levites), and he blessed the whole people. He then ascended the Mount of Nelo, from whence he cast a first and last look upon the land towards which he had pined all his life, and on which his feet were never to tread. He died upon this mountain, 120 years old, in the full vigor of manhood, according to the Scriptures, 'and as man knew his burial-place up to this day'—so that neither his remains nor his tomb were desecrated by 'Divine honours' being superstitiously paid to them.

This is a summary of M.'s life as derived from biblical as well as non-biblical sources. The latter—except, perhaps the very doubtful traditions of Manetho—belong, whatever may be the date of the respective documents of the Pentateuch, to a much later age, and bear the air of tradition and legend, grown out of those very documents, so plainly on their face, that they are of about the same importance for historical purposes as the cycle of Midrah-sagas that have gathered around M., and which are reproduced variously in Moslem Legends. On his office as a 'prophet':—what was the special nature of his revelations, how far the doctrines promulgated by him were traditional among the Abrahamites, and how much of his laws is due to Egyptian influences; whether part of them was first inaugurated by later generations and ascribed to him, or whether others were never carried out at all: on these and similar questions which have been abundantly raised, more especially in recent times, we must refer for fuller information to the special works on the subject. Some notices of the more important points will be found under GENESIS, JOSHUA, PENTATEUCH, DECALOGUE, &c. There seems, however, but one conclusion. The brief span of human history of which we have any knowledge, shows few, if any, men of M.'s towering grandeur—even with all the deductions that the most daring criticism has yet proposed.

MOSHEIM, JOHANN LORENZ VON, a distinguished church historian of Germany, was born at Lübeck on 9th October 1694, and studied at Kiel. In 1723, he became ordinary professor of theology at Helmstedt, from which he was removed in 1747 to a similar office in Göttingen. He died Chancellor of the University of Göttingen, 9th September 1784. His theological works are numerous, amongst which are a work on Bible morality, *Sittenlehre der Heiligen Schrift* (new ed., continued by J. P. Müller, 9 vols. Helmst. 1770—1778); and *Discourses, Heilige Reden* (3 vols. Hamb. 1732, et seq.). But his most important contributions to theological literature are in the department of ecclesiastical history, in which his *Institutiones Historiæ Ecclesiasticæ* (Helmst. 1755) is familiar to every student as a work of great learning, fulness, and accuracy. It has been translated from the original very elegant Latin into English and other languages. The best English translation is that by Dr James Murdock (3 vols. New York, 1832), of which there are many reprints. Besides this, M. is the author of *Institutiones Historiæ Christianæ Majores* (Helmst. 1763); *De Rebus Christianorum ante Constantinum*

## MOSOSAURUS—MOSQUE.

*Commentarii* (Helmst. 1753); *Dissertationes ad Hist. Ecclesiasticam pertinentes* (2 vols. new ed. Altona, 1767); and *Versuch einer unparteiischen Ketzergeschichte* (2 vols. Helmst. 1746—1748). His stand-point is that of liberal orthodoxy; yet he is essentially dogmatic, and pays more regard to the mere 'opinions' of men than to the character and genius shining through them; hence, his *Church History* is far inferior in point of richness, depth, and suggestiveness to that of Neander.

**MOSOSAURUS** (MEUSE LIZARD), a genus of huge marine lizards, whose remains occur in rocks of cretaceous age. Three species are known, one from the upper chalk of Sussex, a second from the cretaceous beds of North America, and the third from the Maestricht beds. This last (*M. Hofmanii*) was first known from a nearly perfect head dug out

Head of Mososaurus.

of St Peter's Mount in 1780, and popularly called the great animal of Maestricht. Originally the property of Hofman, it was taken from him, in virtue of some clause in their charter, by the ecclesiastical authorities of Maestricht, who, in their turn, were compelled to give it up to the victorious French army, and by them it was removed to Paris. It is said that the French cannoniers, when preparing for

the siege, had instructions not to point the artillery towards that part of the town in which the precious specimen was deposited. This head is four feet in length, and the animal to which it belonged is estimated to have been 25 feet long. The total number of the vertebrae was 133; they were concave in front and convex behind, and were fitted to each other by a ball-and-socket joint, admitting of easy and universal flexion; the sacrum seems to have been wanting. The limbs were developed into four large paddles, and these with the comparatively short and strong tail, the bones of which were constructed to give great muscular power, enabled the animal to move quickly through the water in pursuit of its prey. The jaws were furnished with a single row of strong conical teeth. Cuvier first shewed the affinities of the animal. It is most nearly related to the modern monitor, but differs from all modern lizards in its peculiar adaptations for an ocean life, and in its great size. The largest living lacertian is only 5 feet in length, and of this a large proportion is made up by the tail; the *M.*, with its short tail, is estimated to have been at least 25 feet long.

**MOSQUE**, a Mohammedan house of prayer. The word is derived, through the Italian *moschea*, from the Arabic *mesjid*, a place of prayer. The form of the oldest mosques (at Jerusalem and Cairo) is evidently derived from that of the Christian Basilica, the narthex being the origin of the court, with its arcade, and the eastern apses representing the principal buildings of the mosque facing Mecca. The original forms became, however, entirely obliterated in the progress of Mohammedan architecture, and the mosques, with their arcaded courts, gateways, domes, and minarets, became the most characteristic edifices of Saracenic art. Wherever the Mohammedan faith prevailed, from Spain to India, beautiful examples of these buildings exist. They vary considerably in style in

Great Mosque at Delhi, from the North-east.—From Fergusson's *Hand-Book of Architecture*.

different countries, the Saracens generally borrowing much from the architecture of the various nations who adopted their faith. In India, the mosques have many features in common with the temples of the Jains, while in Turkey they resemble the Byzantine architecture of Constantinople. Everywhere the dome is one of the leading and most beautiful features of the mosques, which commonly consist of porticoes surrounding an open square, in the centre of which is a tank or fountain for ablution. Ara-

besques and sentences of the Koran inscribed upon the walls, which are generally white-washed, and never bear any device representing a living thing, are the only ornaments of the interior. The floor is generally covered with mats or carpets; there are no seats. In the south-east is a kind of pulpit (*Mimbar*) for the *Imám*; and in the direction in which Mecca lies (the *Kibleh*), there is a niche (*Mehrab*) towards which the faithful are required to look when they pray. Opposite the pulpit, there

is generally a platform (Dikkeh), surrounded by a parapet, with a desk bearing the Koran, from which portions are read to the congregation. The five daily prayers (see MOHAMMEDANISM), which are generally said at home—especially by the better classes—on week-days, are said in the mosque by the whole congregation on Fridays, the days of Al-Gumah, or the Assembly, the Moslem Sundays, together with some additional prayers, and at times a sermon is superadded to the service. It is not customary for women to visit the mosques, and if they do, they are separated from the male worshippers. The utmost solemnity and decorum are preserved during the service, although in the hours of the afternoon (when there is no worship) people are seen lounging, chatting, even engaged in their trade, in the interior of the sacred building. On entering the mosque, the Moslem takes off his shoes, carries them in his left hand, sole to sole, and putting his right foot first over the threshold, he then performs the necessary ablutions, and finishes by putting his shoes and any arms he may have with him upon the matting before him. The congregation generally arrange themselves in rows parallel to that side of the mosque in which is the niche, and facing that side. The chief officer of a mosque is the Nazir, under whom are two Imams, a kind of religious official, in no way to be compared with what we understand by a clergyman of a creed, but who performs a certain number of religious rites, as long as the Nazir allows him to do so, and who, being very badly remunerated, generally has to find some other occupation besides. There are further many persons attached to a mosque in a lower capacity, as Mueddins (q. v.), Bowwabs (door-keepers), &c., all of whom are paid, not by contributions levied upon the people, but from the funds of the mosque itself. The revenues of mosques are derived from lands. With many of the larger mosques, there are schools, "academies" (Medressehs), and hospitals connected, and public kitchens, in which food is prepared for the poor.

**MOSQUITO** (Span. *gnat*), a name very generally given to the most troublesome species of *Culex*, and allied genera. See *GNAT*. The name *M.* is given, according to Humboldt, in some parts of tropical South America to species of *Simulia*, which are active during the day, whilst species of *Culex*, active chiefly during the night, are called *Zancudo*; but these latter are the mosquitoes of other countries generally. The name was probably first used in the West Indies, where it particularly designates a species (*C. Mosquito*) very similar to the common gnat, but not quite so large, with black proboscis, and marked with silvery white on the head, thorax, and abdomen. It abounds in the warm parts of America, especially in marshy districts and in the vicinity of stagnant waters. It and similar species extend even to very northern regions, appearing during the heat of summer in prodigious swarms. Similar species are found also in similar situations in almost all parts of the world, and are almost as great a pest in Lapland as within the tropics. The bite which they inflict is painful, and their incessant sharp buzzing prevents sleep. In India and other countries, beds are provided with *mosquito curtains* of gauze, which are closely drawn, to protect the occupant, while the natives who cannot avail themselves of such protection, smear their bodies with oil. So numerous are mosquitoes in some localities in South America, that the wretched inhabitants sleep with their bodies covered over with sand three or four inches deep, the head only being left out, which they cover with a handkerchief; and travellers have been obliged to have recourse to the same expedient. Even thick clothes afford at best a very partial protection from mosquitoes being readily penetrated by the

proboscis. Mosquitoes are readily attracted to a lamp, and perish in its flame; but where they are numerous, a lamp only causes additional swarms to congregate to its neighbourhood until it is extinguished, as is often very soon the case, by their dead bodies.

**MOSQUITO COAST, MOSQUITO TERRITORY, or MOSQUITIA**, formerly a native kingdom, under the protectorate of Britain, lies on the east coast of Central America, having Honduras on the north, Nicaragua on the west, and Costa Rica on the south. The area is estimated at 15,000 English square miles, but as 20,000 miles of contested territory lie between it, and Honduras and Nicaragua, its extent would be more correctly given at 25,000 square miles. The coast is low, with many bays and lagoons, and possesses a number of good harbours. The two principal rivers are the Rio de Segovia (which rises within 35 miles of the Pacific Ocean), and the Rio Escondido, both of which flow into the Caribbean Sea. The climate is rainy, and the temperature, considering the latitude, is cool and equal, the thermometer seldom rising above 82° or falling below 71°. On the whole, this territory is one of the most healthy parts of Central America. Ague is not unusually common, epidemics are exceedingly rare, and white people who do not recklessly expose themselves enjoy the best health. The swampy grounds are generally covered with dense forests, in which dye-woods and timber-trees of great value abound. Rice, maize, manioc, and other tropical plants, are cultivated. The country abounds in deer of various kinds, half-wild horses and oxen roam in the savannahs, which are covered with tall grass, and alligators and serpents are common. The chief exports are mahogany, cocoa, ginger, sarsaparilla, and tortoise-shell, but the whole trade is inconsiderable. The inhabitants are of various races, the greater portion being aboriginal, but many are a cross between the native Indians and runaway negroes; they do not number more than from 10,000 to 15,000 in all. Their chief occupations are hunting and fishing, but a little agriculture and cattle breeding are also practised.

The M. C. was discovered in 1502 by Columbus, and though never conquered, was claimed by Spain till about 1660, when the king, with consent of his people, placed himself under the protection of Britain. British colonists at different times attempted to found settlements in various parts of the country, but from various causes were soon after compelled to withdraw. Of late years they have met with more success. The foothold Britain thus obtained in Central America was viewed with great jealousy by the United States, who left no means untried to effect her expulsion. During the British protectorate a sort of constitutional government was established, consisting of a legislative body, and regular jury courts. In July 1850, the United States and Great Britain bound themselves by the Clayton-Bulwer treaty 'not to occupy, fortify, colonise, or exercise dominion over the M. C., or any part of Central America;' and in November 1859, Britain ceded the protectorate of M. C. along with the Bay Islands to Honduras, a proceeding which gave rise to much discontent among the natives of the coast, and a complete rebellion of the islanders. However, by a subsequent treaty, concluded 26th January 1860, the whole territory was finally handed over to Nicaragua.

**MOSSSES** (*Musci*), an order of acotyledonous plants, consisting of mere cellular tissue without vessels, and distinguished from *Hepaticae* (q. v.), the order with which they are most nearly allied, by having always a leafy stem, and an operculated

## MOSTAR—MOTETT.

capsule or urn (*sporangium* or *theca*), which opens at the top, and is filled with spores arranged around a central column (*columella*). The capsule is covered by a hood (*calyptra*); and when it is ripe, and has thrown off the calyptra and operculum, exhibits around its mouth a single or double row of rigid processes, few or numerous, but always either four or a multiple of four, collectively called the *peristome*. These reproductive organs are viewed by many botanists as female flowers or *pistillidia*; whilst reproductive organs of another kind, sometimes found on the same plant, but more generally on distinct plants, are regarded as male flowers or *antheridia*. These are minute cylindrical sacs, occurring in the axils of the leaves, or collected into a head enclosed by variously modified leaves at the summit of the stem, and finally bursting and discharging a great number of spherical or oval vesicles, through the transparent walls of which, when moistened with water, filaments (*spermatozoids*) coiled up within them may be seen wheeling rapidly round and round. As the sacs merely discharge these vesicles and perish, it is

Moss.

(From Stark's Mosses.)

1, perfect plant; a, branches clothed with leaves; b, seta, or footstalk; c, capsule; d, operculum, or lid. 2, branch producing stellate heads, having masses of 'male' flowers, and filaments in centre. 3, spore of moss, germinating. 4, spore of moss in a more advanced state.

supposed that the spermatozoids contained in them may effect the fertilisation of the spore-producing capsules; but this wants confirmation, and their particular office as reproductive organs is not yet fully ascertained.—None of the M. are large plants, many are very small. Many have elongated stems, often branching; others have the stem scarcely developed, so that they seem to consist of a mere tuft of leaves. They are generally social in their manner of growth. They are among the first plants which begin to clothe the surface of rocks, sands, trunks of trees, &c., adapting inorganic matter for the support of higher kinds of vegetation. They love moisture, and are generally more abundant in cold and temperate than in hot climates. They struggle for existence on the utmost limits of vegetation in the polar regions and on mountain-tops. They dry up and appear as dead in a very dry state of the atmosphere, but revive when moisture returns. Some of them grow in bogs, which they gradually fill up and consolidate. They are of great use in

protecting the roots of many plants from cold and from drought, and afford harbour to multitudes of insects. Some of them supply food for cattle, particularly for the reindeer, when nothing better is to be obtained, and a wretched kind of bread is even made by some of the dwellers in the Arctic regions, of species of *Sphagnum*. Some are astringent and diuretic, but their medicinal virtues are unimportant. Among the other principal uses to which they are applied by man are the packing of things liable to be broken, the littering of cattle, the covering of garden plants in winter, and the stuffing of the open space in roofs to moderate the heat of attic rooms in summer and their cold in winter—perhaps the most important use to which they are ever put, at least in Britain, and to which, as the benefit is great and easily attained, it is wonderful that they are not much more frequently applied. The abundance of M. in meadows and pastures is disagreeable to farmers. The best remedies are proper drainage, the application of lime, and the liberal use of other manures, by which the soil may be enriched, so that better plants may grow with sufficient luxuriance, upon which the M. are choked and disappear.

Several thousand species of M. are known. Many of the M. are very beautiful, and their capsules and other organs are interesting objects of study, even with an ordinary magnifying-glass.

**MOSTAR**, a town of European Turkey, capital of Herzegovina (q. v.), on the Narenta, 45 miles south-west of Bosna-Seraf. It is surrounded by embattled walls, contains ten mosques, a Greek church, and a famous Roman bridge of one arch, 95 feet in span. Silk, grapes, and wine are produced, and knife-blades and weapons are manufactured. M. is also a place of considerable trade. Pop. 10,000.

**MÔSUL**, a town of Asiatic Turkey, in the province of Al-Jezireh (ancient Mesopotamia), is situated on the right bank of the Tigris, opposite the ruins of ancient Nineveh (q. v.), and 180 miles up the river from Bagdad. It is surrounded by walls, and is still in a more flourishing condition than most Turkish towns, on account of its caravan-trade with Diarbekir, Bagdad, and Aleppo, though its prosperity is nothing to what it formerly was. During the Middle Ages it supplied all Europe with its rich manufactures—*muslins*, according to Marco Polo, got their name from this town; now, on the contrary, the bazaars of M. are filled with the manufactures of the West. The principal causes of its diminished importance are the rise of Abushehr (q. v.) as an emporium of trade, and the opening up of the new sea-route to India by the Isthmus of Suez. M. is the seat of a Jacobite patriarch, and was formerly the great metropolis of all the Mesopotamian Christians (the Nestorians, the United Chaldeans, the Jacobites, &c.), but war, pestilence, famine, Mohammedan proselytism, oppression, and incessant anarchy, have greatly reduced their numbers. The population is variously estimated at from 18,000 to 40,000, of whom perhaps about a fourth are Christians. There are also about 1500 Jews; the rest are Mohammedans (Arabs, Kurds, and Turks).

**MOTACILLIDÆ**. See WAGTAIL.

**MOTETT**, a name applied to two different forms of musical composition—1. A sacred cantata, consisting of several unconnected movements, as a solo, trio, chorus, fugue, &c.; 2. A choral composition, generally also of a sacred character, beginning with an introduction in the form of a song, perhaps with figurative accompaniment; after which follow several fugue subjects, with their expositions, the whole ending either with the exposition of the last subject, a repetition of the introduction, or a special final subject. A motett differs in this respect from

## MOTH—MOTHERWELL.

a double or triple fugue, that the subjects never appear simultaneously, but are introduced one after the other. In one form of the motett, the successive phrases of an entire chorale are treated as so many fugal subjects.

**MOTH**, the popular name of all the insects included in the section *Nocturna* of the order *Lepidoptera* (q. v.). They formed the genus *Phalena* of Linnaeus, but are now distributed into many genera and families, the species being extremely numerous. Among them are the very largest *Lepidoptera*, and also the smallest. They are distinguished from Hawk-moths, and from most of the butterflies, by their bristle-shaped antennae, tapering from base to apex. The antennae are frequently feathered or pectinated, especially in the males. The proboscis is generally similar to that of butterflies; but there are some groups of moths in which it is merely rudimentary, and these are supposed to take no food after they pass from the larva state. The thorax is generally shorter and more robust than in butterflies; the tibiae of the legs often bear a kind of spur; the wings are held either in a horizontal or in an inclined position when at rest; or, as in many of the smaller moths, are wrapped round the body. The two wings of the same side are generally hooked together in repose by means of bristles on the margin. The females of a few species are wingless.—Moths are generally nocturnal, although to this rule there are a few exceptions. They often exhibit great richness and beauty of colour; although in brightness of colour they are not generally equal to butterflies. Their food is similar to that of butterflies.—They lay great numbers of eggs, which exhibit varieties of form and colour as great as those of the insects themselves. Their caterpillars are more widely various in form and characters than those of butterflies; differing from each other in the number of their legs, and in horns, protuberances, caudal appendages, hairy covering, &c. Some are social both in the larva and chrysalis state; forming, on

Lackey Moth:

A, the belt of eggs; B, the caterpillar; C, the pupa in its cocoon; D, the moth.

their entering the latter state, very curious nests. The chrysalis of a moth is never angular nor furnished with protuberances, and is generally enveloped in a silken cocoon, pretty close and compact; although some moth chrysalids are found in a mere space filled with threads which cross each other in various directions. Silk-worm (q. v.) moths are among the insects most useful to man; but moths in general are regarded by him as injurious, the larvæ of many feeding on leaves of various kinds, and often destroying valuable crops; and

the larvæ of some small species proving very destructive to clothes, books, &c. The largest and most splendid moths inhabit tropical countries. Some of the most interesting and important kinds of moth are noticed in separate articles. Notwithstanding a popular dislike of moths, observation of their habits and of the richness of the colour of many of them, is a favourite pursuit of naturalists.

**MOTHER CAREY'S CHICKEN**, a name familiarly given by sailors to the Storm Petrel and other small oceanic species of Petrel (q. v.).—The

Mother Carey's Chicken, or Storm Petrel (*Procellaria pelagica*).

name **MOTHER CAREY'S GOOSE** is, in like manner, given to the Great Black Petrel or Gigantic Fulmar (*Procellaria gigantea*) of the Pacific Ocean; a bird of about three feet in entire length, with very long wings, and blackish gray plumage, a ravenous feeder on dead whales and all other animal garbage, and which also kills and preys upon other sea-birds.

**MOTHER OF PEARL**, the shells of the large bivalve mollusc *Meleagrina margaritifera*, which also produces the precious pearls. See **PEARL**. These shells are collected in vast numbers in the tropical seas, chiefly on the coasts of Ceylon, Manila, Cuba, Panama, and the South Sea Islands. Those from Panama are small and thick, and are known in commerce as 'bullock' shells; those from Manila are finest in quality, often as much as a foot in diameter, round, and flat. There are two varieties—the white or silver-lipped, and the black-lipped. So enormous is the trade in these shells, that the imports of this country alone amount to 3000 tons per annum, the value of which is nearly £100,000. Although large quantities of these shells are consumed in inlaying fancy wood-work, papier mûché, and in making knife-handles and other small ornamental objects, by far the greater portion is required for the manufacture of buttons, which are chiefly made in Birmingham.

**MOTHER WATER, MOTHER LYE.** See **LYE**.

**MOTHERWELL, WILLIAM**, a Scottish poet and antiquary, was born in Glasgow, 13th October 1797, and educated chiefly at the grammar-school of Paisley, where, in his fifteenth year, he entered the office of the sheriff-clerk. At the age of twenty-one, he was appointed sheriff-clerk *depute* of the county of Renfrew. In the following year he published his first work, the *Harp of Renfrewshire*, containing biographical notices of the poets of that district, from the 16th to the 19th century. This work was but the prelude to one of far greater importance—his *Minstrelsy, Ancient and Modern*,

## MOTHERWORT—MOTION.

It appeared at Glasgow in 1827. In 1828, he founded the *Paisley Magazine*, in which some of the most original pieces first saw the light, and in the same year accepted the editorship of the *Paisley Advertiser*, a Conservative journal. In 1830, he became editor of the *Glasgow Courier*. He died in the city, November 1, 1835, at the early age of 38. His displays in his best moods (but only then, for his inspiration was not constant, and at times he poured forth a stream of very mediocre sentiments) a rich, beautiful, and strong imagination, a warmth and tenderness of feeling, and a thorough knowledge of the language of a poet. *Leanie Morison* is unsurpassed for the mingled beauty and picturesque beauty of its reminiscences of love; *The Sword-Chant of Thorstein Raudi* perhaps the most heroic rune in the English language; and the little piece beginning, 'My heid is to be rend, Willie,' has seldom been read without effect. An enlarged edition of his poetical remains, accompanied by a memoir of his life, was published in London in 1849.

**MOTHERWORT** (*Leonurus Cardiaea*), a plant of the natural order *Labiata*, found about hedges and waste places in Europe, and now abundantly naturalised in some parts of North America. It is very common in Britain, and probably has been introduced. It is perennial, has a branched stem

Motherwort (*Leonurus Cardiaea*).

It grows three feet high, stalked leaves, the lower ones rounded, and crowded whorls of reddish-white flowers. The calyx has five pungent spreading lobes.

The upper lip of the corolla is shaggy on the upper side, the lower lip trifid. The anthers are sprinkled with shining dots. The plant was formerly in much use as a domestic pectoral medicine, but is now comparatively little employed. It has a strong, but not agreeable smell.—Other species of the same genus are found in Europe and North of Asia.

**MOTION.** LAWS OF, are the fundamental principles connecting force and motion in the physical universe; and are obviously to be derived from experiment alone, since intuitive reasoning cannot give us any information as to what may or may not be a law of nature. Though these laws are derived from experiment, it cannot be said that we have any very direct experimental proofs of their

truth—our most satisfactory verifications of them are derived from the exact accordance of the results of calculation with those of observation in the case of such gigantic combinations of mutually influencing bodies as that of the solar system; and it is by such proofs that they must be considered to have been finally established.

They seem first to have been given systematically and completely by Newton, at the opening of the *Principia*; but the first two were known to Galileo, and some of the many forms of a part of the third were known to Hooke, Huyghens, Wren, and others. We shall give them here in order, with a few brief comments, shewing their necessity and their use.

First, then, we naturally inquire, what matter would do if left to itself; and, by considering cases in which less and less external force is applied to a body, we are led to the statement called the *first law of motion*:

1. *Every body continues in its state of rest or of uniform motion in a straight line, except in so far as it may be compelled by impressed forces to change that state.*

This expresses simply the *inertia* of matter—i. e., a body cannot alter its state of rest or motion; for any such alteration external force is required. Hence the definition of Force (q. v.), as that which changes or tends to change a body's state of rest or motion.

Now, how does the change of state depend on the force which produces it? This is obviously a new question, to be resolved by experiment; and the answer is the *second law of motion*:

2. *Change of motion is proportional to the impressed force, and takes place in the direction of the straight line in which the force acts.*

Newton's silence is as expressive as his speech. Nothing is here said about the previous motion of the body, or about the number of forces which may be at work simultaneously. Hence, a force produces its full effect in the form of change of motion, whether it act singly, or be associated with others; and whatever, moreover, be the original motion of the body to which it is applied. Hence, there is no such thing as equilibrium of forces; every force produces motion—and what we call equilibrium is not the balancing of forces, but the balancing of their effects. Hence, the absurdity of attempting to found the science of Statics on any other basis than is to be derived from the second law of motion; which, in fact, leads us at once (by the *Parallelogram of Velocities*, which is a purely geometrical conception) to the *Parallelogram of Forces*, and thence, with the help of the third law, to the whole subject of Statics. The second law also supplies the means of measuring force and mass; and of solving any problem whatever concerning the motion of one particle.

But more is required before we can study the motion of a system of particles—as a rigid body, or a liquid, for instance; or a system of connected bodies. Here there are mutual actions and reactions of the nature of pressure or of transference of energy (see FORCE) between the parts—and these are regulated by the *third law of motion*:

3. *To every action there is always an equal and contrary reaction: or, the mutual actions of any two bodies are always equal and oppositely directed in the same straight line.*

Thus, the mutual pressure between two bodies has equal, but *opposite*, values for the two. The tension of a rope is the same throughout, and tends as much to pull back the horse at one end as to pull forward the canal-boat at the other. The earth exerts as much attractive force on the sun as the sun exerts

## MOTION.

on the earth—and the same law applies to the other attractive and repulsive forces, as those of electricity and magnetism.

But Newton goes much further than this; he shews, in fact, that action and reaction (subject to the third law) may consist in *work done by a force*, instead of the mere force or pressure itself. From this form of the third law we derive at once the principle of Virtual Velocities (q.v.), which in its application to machines is familiar as '*What is gained in power is lost in speed.*' But we also derive the grand principle of the indestructibility of work or energy: at all events in the case of the ordinary mechanical forces—and this must be regarded as one of the grandest discoveries which science owes to Newton. It is true that he merely *mentions* it, and then abruptly passes to another subject; yet we can hardly exaggerate the value of this single remark. Experimenters, mainly Davy and Joule, have since shewn that all the physical energies, as heat, light, electricity, &c., are subject in their transformations to the third law of motion, and thus the system constructed by Newton for ordinary dynamical purposes, is now found to rule the most mysterious of the affections of matter. For a development of this, see our article on FORCE.

**MOTION, ANIMAL.** Motion or progression is that function by which an animal is able to transport itself from place to place. It is enjoyed exclusively by animals, there being nothing strictly analogous to it in the vegetable kingdom. The organs employed in locomotion are of two kinds, the *passive* and the *active*; the former including all those textures which form the skeleton, and by which its segments are united, as fibrous and areolar tissue, synovial membrane, cartilage, fibro-cartilage, and bone, while the latter includes the muscles with the nerves, which convey to them the mandates of the will.

Before proceeding to notice the different modes of progression of men and animals, it may be expedient to say a few words on *standing*, or the natural attitude of an animal. This attitude depends upon the form and functions of the limbs. Most of the terrestrial mammals and the reptiles (excepting the serpents), both of which use four feet in walking, have the backbone (the vertebral column) nearly horizontal (being only slightly concave downwards), and resting, at the same time, both on the fore and hind legs. Birds, whose anterior extremities are intended for flight, stand upon the posterior limbs only, although in their case, too, the backbone is generally nearly horizontal when the animal is at rest. Man alone stands erect with his head supported on the summit of the nearly vertical vertebral column. Some other animals (monkeys, hares, kangaroos, &c.) can rise more or less erect, but in their case the attitude is obviously not the natural one.

In standing, it is requisite that the limbs should be so arranged that the centre of gravity may fall within the space included by the feet. If the centre of gravity does not fall within this space, the animal cannot stand, but must fall to that side to which the centre of gravity inclines. On this account certain aquatic birds (the albatross, for example), which have their feet placed very far back, cannot use them for walking. If an animal has four legs, it is not necessary that they should have the broad base, which is essential in bipeds. We see that most quadrupeds have comparatively small feet, while birds are furnished with long toes, which, when spread out, form large bases of support. Moreover, the flexor muscles of the toes are so arranged that the weight of the body causes them

to contract firmly, and hence birds are enabled to sleep standing without any effort.

*Walking* is the most common form of progression. When it is accomplished by two legs only, as in man, the body is inclined forwards, carrying the centre of gravity in that direction; and while one leg supports the body, the other is thrown forward to prevent it from falling, and to sustain it in turn. Hence, walking has been defined to be a continual falling forwards, interrupted by the projection of the leg. Those writers who have especially studied the theory of walking (Borelli, the brothers Weber, and Bishop) have divided the time of a step into two portions—i.e., that in which one leg only rests on the ground, and that in which both legs rest on the ground. The period in which both feet are on the ground is shorter than that in which the body is supported by one leg only. During the time the body is supported by one leg, the other leg swings from behind forwards, without the active intervention of its muscles, but by the mere force of gravity—in short, like the pendulum of a clock. When this leg is again placed on the ground, the first interval ends, and the other—i.e., that in which the body is supported by both legs—begins, and of course terminates with the raising of the other leg. The time that the body is supported by both legs diminishes as the velocity increases, and vanishes as the walk merges into a run; while, on the other hand, it attains its maximum in extremely slow walking, when it is found by experiment to amount to half the time in which only one leg supports the body. The greatest velocity of walking is attained when the time of a step is equal to half the duration of the motion of the swinging leg, and the velocity in walking of any given person depends on the time taken in making each step, and on the length of the steps; and both of these are, again, dependent on the height at which the centre of gravity of the body or the heads of the thigh-bones are carried above the ground; for as the height of the latter diminishes, the length of the step is increased, while its time is diminished, and *vice versa*. The best walkers are incapable of acquiring a speed of more than seven miles an hour, and even this speed cannot be kept up for any length of time. The walking of quadrupeds is a similar process to that of bipeds, except that the body always rests on at least two legs. The limbs are raised in a determinate order, and usually in such a manner that the hind-leg of one side succeeds the fore-leg of the opposite side.

*Running* consists of the same succession of motions as walking; but these motions are so accelerated, that there is a period between two steps when the body is not supported on either leg; and this constitutes the essential difference between the two paces. It requires a far greater expenditure of muscular force than walking, and cannot be long maintained without considerable exhaustion. First-rate runners can accomplish a mile in a few seconds under four minutes and a half, and ten miles in an hour. (Levett in a match with Frost, which came off on the 22d of March 1852, at Copenhagen Fields, ran 10 miles 250 yards, in 52 5/8, and Deerfoot ran 11 miles 740 yards, at Brompton, in an hour.) In quadrupeds there are various paces besides walking, which are known as trotting, cantering, and galloping; and as every one is familiar with the ordinary paces of the horse, we shall take that animal as our illustration. In trotting, the horse moves its legs in pairs diagonally. Thus, if the left fore and right hind leg be raised, and advanced first, the right fore and left hind leg will be raised the instant the others reach the ground. In fact, in trotting, the first pair are actually raised before the

other legs reach the ground, so that there is a minute interval when all four legs are raised above the ground at the same time. The velocity acquired by moving the legs in pairs (as in running), instead of consecutively (as in walking), depends upon the circumstance, that in trotting each leg rests on the ground during a short time and swings during a long time, while in walking the swing occupies a short period, and the rest a comparatively long one. In *cantering*, the animal, after advancing the two fore-legs one after the other, brings forward the two hind-legs simultaneously; and when this movement is greatly urged, the fore-legs are raised together, as well as the hind-legs, and the pace then becomes the *gallop*.

In *leaping*, the horse raises the fore-legs from the ground, and propels the body upwards and forwards by the hind-legs alone. This act in the horse is, however, mainly the result of education, and those animals that leap or spring upon their prey (as the members of the cat tribe) crouch before leaping, in order to throw the body forward with the greatest possible force, by first bending all the limbs, and then suddenly extending them. As the hind-legs are, however, the essential agents in leaping, we observe that in those animals whose natural mode of progression is leaping—as frogs, hares, kangaroos, &c.—the hind-legs are much longer, and more muscular than the fore-legs. Leaping is a common mode of progression in many short-legged birds (blackbirds, thrushes, finches, sparrows, &c.), in which the step would be extremely short if performed by moving the legs alternately. There is also a large number of insects, such as grasshoppers, fleas, &c., whose ordinary mode of progression is by leaps; and it is in this class of animals that the leaping power is developed to its greatest extent. The common flea, for example, can leap 200 times its own length. While fleas, locusts, and grasshoppers leap by means of their long and strong hind-legs; other insects, as the *Poduridae*, or spring-tails, possess a forked tail, which they bend beneath the body, and which, when suddenly extended, propels them to a considerable distance.

*Climbing*, is merely walking on an inclined or vertical surface. It is usually accomplished by means of sharp nails or claws, as in the cat-tribe, the lizards, &c. In many birds, as the woodpeckers, parrots, &c., the toes are arranged in two divisions, so as to grasp branches in the manner of a hand. Bears and sloths use their arms for climbing, while monkeys use their hands, and in some cases their tails. It is only in a very few cases, as in the sloth, that this is the ordinary method of progression.

The act of *flying* in the bird is accomplished by the simultaneous action of the two anterior limbs, the wings, much as leaping is by that of the two posterior limbs. See *FLYING; BIRDS*. Many attempts have been made to estimate the velocity at which different birds can fly. Whether, as has been stated, the eider-duck can fly 90, and the hawk 150 miles in an hour, is very questionable; but it has been ascertained that carrier-pigeons can accomplish from 38 to 42 miles in that time.

The bats are the only mammals which possess a true power of flight. For a description of their organs and mode of flight, we must refer to the article *BAT*, where will also be found a notice of the false claims of some other mammals, as the so-called flying-squirrel, to the possession of true flight. Similarly, the actions of the flying lizard and of the flying-fish are not true flight. In no class of animals is the mechanism of flight so perfect as in insects. The dragon-fly, for example, can outstrip the swallow; and can do more in the air than any bird, as it can fly backwards and sidelong,

to right or left, as well as forwards without turning. The wings of insects, of which there may be either one or two pair, are analogous (as instruments of motion) to the feathered wings of birds, but are regarded as homologous to (or in their essential nature) branchiae or respiratory organs. For details regarding the mechanism employed in their aerial progression by insects, see *INSECTS*.

*Swimming* is the mode of progression employed by most aquatic animals. It mainly differs from flying in this respect, that water being much more dense than air, and the body of the animal being nearly of the same weight as the water it displaces, very little effort is required to keep the animal from sinking, and hence almost the whole of the muscular force can be employed in progression. In fishes, the locomotive organs consist of the fins and tail, the latter being the great propelling organ. The swimming of a fish has been correctly compared to the motion of a boat propelled by a single oar or scull at the stern. In the same manner as a succession of strokes alternately right and left propels the boat straight forwards, so the fish advances by striking alternately right and left with its tail. The caudal fin, in which the tail ends, is vertical in fishes, and is usually considerably forked, when there is great speed. The ventral fins are for the purpose of keeping the fish in its proper position, with the back upwards, as is shewn by a well-known experiment of Borelli, who, after cutting off these fins, restored the living fish to the water, when it rolled from side to side like a drunken man. The air-bladder with which many fishes are provided, and which they can distend and contract at pleasure, facilitates their swimming by enabling them to modify their specific gravity. Most terrestrial mammals, excepting man, swim at once the first time they find themselves in deep water. The reason of this is, that their limbs move in water precisely as they do on land, and no new action either as regards direction or order is required, as is the case with man, to enable them to swim. Those which frequent the water, as seals, otters, and beavers, have webbed feet like ducks and other palmiped birds, the toes being united by membranes, which, when expanded, act as paddles. A large number of invertebrate animals move chiefly by swimming. Thus lobsters move by means of a vertical motion of the tail, and many of the crabs by means of their posterior legs, which are fashioned like oars. Many insects swim with their legs, which are fringed with hairs to give additional surface. The cuttle-fish uses its long arms as oars, and darts through the water with extreme rapidity; while other molluscs erect sail-like organs, by which they are propelled along the surface of the water. *SWIMMING*, as a gymnastic exercise, is described in a separate article.

Notices of the more special modes of progression will be found under a variety of heads. See *CRUSTACEA, SERPENTS, WORMS*.

*MOTION*, in Plants. See *IRRITABILITY* and *SPORE*.

*MOTIVE*, or *MOTIVO*, in a musical composition, means the principal subject on which the movement is constructed, and which, during the movement, is constantly appearing in one or other of the parts, either complete or modified. In elaborate and long compositions there are also secondary motives.

*MOTLEY*, JOHN LOTHROP, LL.D., D.C.L., &c., American historian, was born at Dorchester, Massachusetts, April 15, 1814. After graduating at Harvard University, he spent a year at Göttingen, another at Berlin, and travelled in Italy and other

parts of Southern Europe. Returning to America, he studied law, and was admitted to the bar in 1837; but preferring literature, he wrote a historical romance, entitled *Morton's Hope* (1839), which had little success. In 1840, he received the appointment of secretary of legation to the American Embassy to Russia, but soon resigned, and in 1849, published another unsuccessful novel, entitled *Merry Mount, a Romance of the Massachusetts Colony*. He attracted attention, however, by some valuable historical essays for American reviews, among which may be mentioned one on De Tocqueville's *Democracy in America*, and another on 'Peter the Great;' and having planned a history of Holland, he proceeded to Europe for materials, and after five years' labour, published in 1856 *The Rise of the Dutch Republic*. In 1860 appeared a continuation of it: *The History of the United Netherlands from the Death of William the Silent to the Synod of Dort*. M. was appointed in 1861 United States minister at the court of Vienna, a post from which he was recalled in 1867. In 1869 he was sent as minister to the court of St James, but was recalled the following year. His latest publication is *The Life and Death of John of Barneveldt, Advocate of Holland; with a View of the Primary Causes and Movements of the Thirty Years' War* (2 vols. 1874).

**MOTRIL**, a town of Spain, in the province of Granada, and 35 miles south of the city of that name, in a productive district 3 miles from the sea. Agriculture and fishing are the principal employments of the inhabitants. Pop. 14,000.

**MOTTO**, in Heraldry, a word or short sentence which forms an accompaniment to a coat-of-arms, crest, or household badge. Mottoes were originally attached to the badge when the family had one, or to the crest where there was no badge. In later heraldry, the practice is to place the motto in an escrol either over the crest or below the shield. A motto is sometimes a religious or moral sentiment, as 'Gardez la foi,' 'Humanitate;' it is not unfrequently a heroic exclamation or war-cry, 'Courage sans peur,' 'Forward.' In a great many cases it bears reference to the crest, badge, or some bearing of the escutcheon; thus, Stuart, Earl of Moray, has for crest a pelican wounding herself, and for motto, 'Salus per Christum Redemptorem;' and not a few mottoes are punning allusions to the family name—as Scudamore, 'Scuto amoris Divini;' Vernon, 'Ver non semper viret;' 'Fare, fac,' for Fairfax; and 'Time Deum, cole regem,' for Coleridge. Two mottoes are sometimes used by the same family—one above the crest, the other below the shield. The motto, 'Dieu et mon Droit,' which accompanies the royal arms of Great Britain, is supposed to have been a war-cry, and was used in England at least as early as the time of Henry VI. Its origin has been assigned to a saying of Richard I., 'Not we, but God and our right have vanquished France.'

**MOU'FFLON**, or **MU'SMON** (*Ovis* or *Caprovis Musimon*), the wild-sheep of Corsica, Sardinia, Cyprus, Greece, &c. It is about the size of a small fallow-deer, covered with hair and not with wool, except that hair of a somewhat woolly character appears in winter. The upper parts are brownish, the under parts whitish; the hair of the neck is long; the tail is very short. The horns of the male are very large, approaching to those of the Argali. The M. lives chiefly in the higher parts of mountainous regions, and is not easily approached by the hunter.

**MOULD**, or **MOULDINESS**, the common name of many minute fungi which make their appearance, often in crowded multitudes, on animal and vegetable substances, either in a decaying or in a living but

morbid state. To the naked eye, they often seem like patches or masses of fine cobweb, and are discovered by the microscope to consist of threads more or less distinctly jointed, sometimes branched. Some species of M. occur on many different substances; others seem to be peculiar to substances of particular kinds, as decaying pears, decaying gourds, &c.

Some of the moulds belong to the suborder of fungi called *Phycomycetes*. See **FUNGI**. One of these is the **COMMON M.** (*Mucor mucedo*), so plentifully found on fruit, paste, preserves, &c., in a state of incipient decay, the progress of which it hastens. It consists

Common Mould (*Mucor mucedo*), highly magnified.

of cobweb-like masses of threads, from which rise many short stems, each bearing at the tip a roundish membranous blackish spore-case.—A nearly allied, and also very common species, is *Ascopora mucedo*, which forms a bluish M. on bread. From a spreading cobweb-like bed rise long slender branches, terminated by spore-cases, of which the vesicle collapses into the form of a little *pileus*.—An interesting species of M. remarkable for its luxuriance and beauty of colour—at first white, then yellow, with orange spore-cases, then shining green or olive, and with threads often several inches long—grows on fatty substances.—Other species of M. are ranked among *Hypomycetes*, a suborder of Fungi, having a floccose thallus and naked spores. One of these is the **BLUE M.** (*Aspergillus glaucus*), which imparts to cheese a flavour so agreeable to epicures, and perhaps marks it as in a condition most suitable for promoting the digestion of other aliments, of which epicures eat too much. Advantage is often taken of the fact, that a small portion of cheese affected with M. will speedily infect sound cheese into which it may be introduced. It is one of the few cases in which the propagation of these fungi is ever desired and sought after by man.—**Snow M.** (*Lanconia nivalis*) is found on grasses, and especially on barley and rye beneath snow, often destroying whole crops. It appears in white patches of a foot or more in diameter, which finally become red as if dusted with red powder.

Even living animals are liable to be injured by fungi of this kind. Silk-worms are killed in great numbers by one called **MUSCARDINE** (q. v.), or **SILK-WORM ROT**. Such fungi are sometimes developed on the mucous membrane and in internal cavities of vertebrated animals; and on the bodies of invertebrated animals, as the common house-fly, which, in the end of autumn, when it becomes languid, often dies from this cause. Even strongly-scented substances, if moist, are liable to be attacked by M. of one kind or other; nor are strong poisons, either animal or vegetable, a sufficient safeguard. *Aspergilla mucedo* springs up readily in paste full of corrosive sublimate; and the mycelium of moulds is found in strong arsenical solutions. The only safe preventive of M. is dryness. Many of the moulds vegetate in liquids, but do not attain their perfect development, only appearing as filamentous and flocculent mycelia. The *Vinegar Plant* (q. v.) is an instance of this kind.

Mildews and Moulds are very nearly allied.

The rapidity with which these fungi are produced is marvellous. 'In favourable circumstances, a plant will pass through every stage of growth to perfect maturation of its seeds in less than two days, the threads which sustain the ripe sporangia

## MOULD—MOULMEIN.

being so long, and yet so delicate, as to make it a marvel that they can remain erect.'—(*Berkeley*).

**MOULD**, the model or pattern from which workmen execute mouldings, ornaments, &c. Also, the shape or bed in which metal and other castings are made.

**MOULDINGS**, the curved and plane surfaces used as ornaments in cornices, panels, arches, &c., and in all enriched apertures in buildings. In classic architecture the mouldings are few in number, and

Classic Mouldings.

definitely fixed in their forms. There are eight kinds of these regular mouldings, viz., the Cyma, the Ovolo (or Echinus), the Talon, the Cavetto, the Torus, the Astragal, the Scotia, and the Fillet (q. v.); and each of these mouldings has its proper place assigned to it in each order. See COLUMN. In Gothic architecture, and all other styles, the mouldings are not reduced to a system as in the Greek and Roman styles, but may be used in every variety of form at the pleasure of the artist. Certain forms generally prevail at one period in any style. Thus, in Gothic architecture, the date of a building may in many instances be determined by the form of the mouldings.

Various Mouldings.

The Norman mouldings were very simple in outline, and frequently enriched with the zigzag and billet ornaments. Fig. 1 is a common Norman form.

In the early English style, the mouldings are also simple in outline, and are usually arranged in rectangular divisions, as in fig. 3, and consist of alternate rounds and hollows. In late examples of this style, the fillet was introduced (fig. 2), and

led to the more elaborate form of mouldings during the Decorated period (fig. 4).

The mouldings of the perpendicular style are generally flatter and thinner than the preceding, and have large hollows separated by narrow fillets, which produce a meagre effect.

Each of these styles has its peculiar ornaments and style of foliage; and when these are used along with the mouldings, there is no difficulty in determining the approximate date of a building.

**MOULINS**, a town of France, capital of the department of Allier, on the right bank of the river Allier, here crossed by a handsome stone bridge of 13 arches, lies 213 miles, by railway, south-east of Paris, and 95 miles north-west of Lyon. M. was formerly the capital of Bourbonnais. It is a clean, well-built town, with pretty promenades. The principal buildings are the cathedral of Notre Dame (for the enlargement of which the sum of one and a half million francs was granted in 1852), the museum, the theatre, the public library containing 20,000 vols., the new town-house, the Palace of Justice, and the college. Of the old castle, built by the Duc de Bourbon in 1530, only a square tower remains, which is used as a prison. M. carries on trade in coal, wood, iron, grain, wine, oil, and cattle. Pop. (1872) 17,836.

**MOULMEIN**, the seat of government of the Tenasserim Provinces (q. v.), situated on the Gulf of Martaban, in the east of the Bay of Bengal, at the junction of the rivers Salween, Gyne, and Attaran, in 16° 29' N. lat., and 97° 38' E. long. M., one of the healthiest stations in India, is a pretty specimen of an eastern town. It is divided into five districts, each of which is under a gong or native head of police. The streets are, for the most part, shaded with trees, principally of the acacia tribe, and the glossy jack is often seen half covering a native house, its great fruit, as large as a child's head, ripening in the sun. The principal street, about 3 miles in length, runs due north and south, and parallel with the river Salween. The native houses are constructed in the usual Burman style of bamboo, and a thatch made of the leaf of the water-palm. All are raised on piles, according to the universal custom of the country. Men walk about with the green paper chattrah, or Chinese umbrella, used throughout the provinces; the *gharie*, or India cab, dashes along, the attendant imp revelling in heat and dust.

M. is backed by a fine range of hills, on whose heights flash the gilded spires of innumerable pagodas; and here, too, are built many pretty residences, commanding a fine view of the town, river, and adjacent country, which for picturesque beauty and varied scenery has few equals. M. boasts various churches, chapels, and missionary establishments, several charitable and educational institutions, substantial barracks, a general hospital, public library, &c. Vessels drawing 10 feet of water can come up to M., under charge of pilots from Amherst, and at spring-tide ships of any tonnage may reach the town. The rise and fall of the water is at that time from 20 to 23 feet. The population of M. is steadily, if slowly, on the increase. In 1856, it was 43,683; in 1872, it had reached 46,242. Of these, divided according to their religion, about 27,000 were Buddhists, 11,000 Hindus, 6000 Mussulmans, and 2000 Christians. The mean temperature of M. for the year 1872 was 78°—the highest being 96° in April, and the lowest 61° in January. As to nationality, besides the Burmans proper, the inhabitants of M. include Eurasians or half-castes, Taliens, Chinese, Shans, Karens, Armenians, Jews, Malays, and natives of Hindustan.

M. possesses great facilities for ship-building, and

## MOULTING—MOUNTAINS.

many fine vessels have lately been constructed in the building-yards of Tavoyzoo and Mopoon. The principal exports from M. are teak-timber and rice; the imports consist of general merchandise, chiefly piece-goods, hardware, provisions, and sundries.

See *The Tenasserim and Martaban Directory*; *Winter's Six Months in British Burmah* (Lond. 1858); *Marshall's Four Years in Burmah* (Lond. 1860); *Blue-Books* (1872—1873).

**MOULTING** is the term applied by naturalists to the periodical exuviation, or throwing off of certain structures, which are for the most part of an epithelial or epidermic character. Thus, in a considerable number of the *Articulata*, the external covering is thrown off, and replaced many times during life. In some of the minute Entomostracous Crustacea of our pools, a process of moulting, similar to that which occurs in crabs and lobsters, occurs every two or three days, even when the animals seem to have attained their full growth. In the crabs, in which the process has been carefully observed, the *exuvium*, or cast-off shell, consists not only of the entire external covering, including even the faceted membrane which forms the anterior coat of the compound eyes, but also carries with it the lining membrane of the stomach, and the plates to which the muscles are attached. During growth, this moulting takes place as often as the body becomes too large for the shell; and after the animal has attained its full size, it is found to occur at least once a year, at the reproductive season. During the early growth of insects, spiders, centipedes, &c., a similar moult is frequently repeated at short intervals, but after they have attained their full size, no further moulting takes place. In the *Vertebrata* we have examples of as complete a moulting, and replacement of new skin, among frogs and serpents as occurs in the *Articulata*, the whole epidermis being thrown off at least once, and, in some instances, several times yearly. In birds, the feathers are periodically cast off and renewed; in mammals generally, the hair is regularly shed at certain periods of the year; and in the deer tribe the casting off and renewal of the antlers must be regarded as a special example of moulting. In man, the continual exuviation of the outer layers of the epidermis is a process analogous to that which takes place on a more general scale in the lower animals.

**MOULTRIE, FORT**, a fortress on Sullivan's Island, at the mouth of Charleston Harbour, South Carolina, celebrated for the repulse of a British squadron commanded by Sir Peter Parker, January 28, 1776. The fort, at that time, was hastily built of Palmetto logs and sand, with 31 guns and 435 men. The spongy wood of the palmetto was found to resist the cannon balls perfectly. The fort was afterwards rebuilt, and in April 1861, took part in the reduction of Fort Sumter, and the commencement of active hostilities in the civil war of secession.

**MOUND** (Lat. *mundus*), in Heraldry, a representation of a globe, surmounted with a cross (generally) pattée. As a device, it is said to have been used by the Emperor Justinian, and to have been intended to represent the ascendancy of Christianity over the world. The royal crown of England is surmounted by a mound, which first appears on the seal of William the Conqueror, though the globe without the cross was used earlier.

Mound.

**MOUNT**, in Heraldry. When the lower part of the shield is occupied with a representation of ground slightly raised, and covered with grass, this is called a mount in base; e.g., Argent, on a mount in base, a grove of trees ppr.—Walkinshaw of that ilk, Scotland.

Mount.

**MOUNT VERNON**, the seat and tomb of George Washington, first President of the United States of America, on the right bank of the river Potomac, in Virginia, 15 miles below Washington. The residence of Washington, finely situated on the rising bank of the river, and his tomb, with an estate of 200 acres, have been purchased by a patriotic society of ladies, to be kept as a place of public resort, and a memorial of the 'Father of his country.'

**MOUNTAIN ASH.** See ROWAN.

**MOUNTAIN LIMESTONE**, the basement rock of the carboniferous series in the south of England and in Wales. It consists of a calcareous rock loaded with marine remains, the greater part of the rock being made up bodily of corals, crinoids, and shells. It has a variable thickness, sometimes reaching as much as 900 feet. In the north of England and in Scotland, the marine limestones are not separated from, but alternate with the coal-bearing strata. See CARBONIFEROUS SYSTEM.

**MOUNTAINS.** The number and altitude of the mountains of the globe are so great that they form almost everywhere prominent objects, and operate to a large extent in modifying the climatic conditions of every country in the world. Yet the amount of solid material so raised above the ordinary level of the land is not so much as might be expected. Remembering that elevated plateaus of great extent occur in several regions, and that the general surface of the earth is considerably higher than the sea-level, it has been estimated that were the whole dry land reduced to a uniform level, it would form a plain having an elevation of 1800 feet above the sea. And were these solid materials scattered over the whole surface of the globe, so as to fill up the bed of the ocean, the resulting level would be considerably below the present surface of the sea, inasmuch as the mean height of the dry land most probably does not exceed one-fifteenth of the mean depth of the bed of the ocean.

Mountains, and especially mountain-chains, subserve important uses in the economy of nature, especially in connection with the water system of the world. They are at once the great collectors and distributors of water. In the passage of moisture-charged winds across them, the moisture is precipitated as rain or snow. When mountain-ranges intersect the course of constant winds by thus abstracting the moisture, they produce a moist country on the windward-side, and a comparatively dry and arid one on the leeward. This is exemplified in the Andes, the precipitous western slopes of which has a different aspect from the sloping eastern plains; and so also the greater supply of moisture on the southern sides of the Himalayas brings the snow-line 5000 feet lower than on the northern side. Above a certain height the moisture falls as snow, and a range of snow-clad summits would form a more effectual separation between the plains on either side than would the widest ocean, were it not that transverse valleys are of frequent occurrence, which open up a pass, or way of transit, at a level below the snow-line. But even these would not prevent the range being an impassable

## MOUNTAINS.

barrier, if the temperate regions contained as lofty mountains as the tropics. Mountain-ranges, however, decrease in height from the equator to the poles in relation to the snow-line.

The numerous attempts that have been made to generalise on the distribution of mountains on the globe have hitherto been almost unsuccessful. In America, the mountains take a general direction more or less parallel to the meridian, and for a distance of 8280 miles, from Patagonia to the Arctic Ocean, form a vast and precipitous range of lofty mountains, which follow the coast-line in South America, and spread somewhat out in North America, presenting everywhere throughout their course a tendency to separate into two or more parallel ridges, and giving to the whole continent the character of a precipitous and lofty western border, gradually lowering into an immense expanse of eastern lowlands. In the Old World, on the other hand, there is no single well-defined continuous chain connected with the coast-line. The principal ranges are grouped together in a Y-shaped form, the general direction of which is at right angles to the New World chain. The centre of the system in the Himalayas is the highest land in the hemisphere. From this, one arm radiates in a north-east direction, and terminates in the high land at Behring Straits: the other two take a westerly course; the one a little to the north, through the Caucasus, Carpathians, and Alps, to the Pyrenees; the other more to the south, through the immense chain of Central African mountains, and terminating

at Sierra Leone. Most of the principal secondary ranges have generally a direction more or less at right angles to this great mountain tract.

The inquiry into the origin of mountains is one that has received not a little attention. Geologists have shewn that the principal agents in altering the surface of the globe are denudation, which is always abrading and carrying to a lower level the exposed surfaces, and an internal force which is raising or depressing the existing strata, or bringing unstratified rocks to the surface. Whether the changes are the small and almost imperceptible alterations now taking place, or those recorded in the mighty mountains and deep valleys everywhere existing, denudation and internal force are the great producing causes. These give us two great classes of mountains.

1. *Mountains produced by denudation.*—The extent to which denudation has altered the surface of the globe can scarcely be imagined. All the stratified rocks are produced by its action; but these do not measure its full amount, for many of these beds have been deposited and denuded, not once or twice, but repeatedly, before they reached their present state. Masses of rock more indurated, or better defended from the wasting currents than those around, serve as indices of the extent of denudation. The most remarkable case of this kind, with which we are acquainted, is that of the three insulated mountains in Ross-shire—Suil Veinn, Coul Beg, and Coul More (fig. 1)—which are about 3000 feet high. The strata of the mountains

Fig. 1.—Suil Veinn, Coul Beg, and Coul More.—From Murchison's *Siluria*: London, J. Murray.

are horizontal, like the courses of masonry in a pyramid, and their deep red colour is in striking contrast with the cold bluish hue of the gneiss which forms the plain, and on whose upturned edges the mountain-beds rest. It seems very probable, as Hugh Miller suggests, that when the formation of which these are relics (at one time considered as Old Red Sandstone, but now determined by Sir Roderick Murchison as being older than Silurian), was first raised above the waves, it covered, with an amazing thickness, the whole surface of the Highlands of Scotland, from Ben Lomond to the Maiden Paps of Caithness, but that subsequent denudation swept it all away, except in circumscribed districts, and in detached localities like these pyramidal hills.

2. *Mountains produced by internal force.*—These are of several kinds. (a.) Mountains of ejection, in which the internal force is confined to a point, so to speak, having the means of exhausting itself

through an opening in the surface. The lava, scoriae, and stones ejected at this opening form a conical projection which, at least on the surface, is composed of strata sloping away from the crater. Volcanoes are mostly isolated conical hills, yet they chiefly occur in a somewhat tortuous linear series, on the mainland and islands which enclose the great Pacific Ocean. Vesuvius and the other European volcanoes are unconnected with this immense volcanic tract. (b.) But the internal force may be diffused under a large tract or zone, which, if it obtain no relief from an opening, will be elevated in the mass. When the upheaval occurs to any extent, the strata are subjected to great tension. If they can bear it, a soft rounded mountain-chain is the result; but generally one or more series of cracks are formed, and into them igneous rocks are pushed, which, rising up into mountain-chains, elevate the stratified rocks on their flanks, and perhaps as parallel ridges. Thus, the Andes

## MOURNE MOUNTAINS—MOUSE.

consist of the stratified rocks of various ages, lying in order on the granite and porphyry of which the mass of the range is composed. The position of the strata on such mountains supplies the means of determining, within definite limits, the period of upheaval. The newest strata that have been elevated on the sides of the mountain when it was formed, give a date antecedent to that at which the elevation took place, while the horizontal strata at the base of the mountain supply one subsequent to that event. Thus, the principal chain of the Alps was raised

Fig. 2.—Principal System of the Alps :

1, Granitic rocks; 2, Palaeozoic; 3, Secondary; 4, Tertiary; 5, Recent.

during the period between the deposition of the Tertiary and that of the older recent deposits. (c.) But there is yet another way in which the upheaving internal force operates, viz., where it does not act at right angles to the surface, but rather obliquely, and, as it were, pushes the solid strata forwards, causing them to rise in huge folds, which, becoming permanent, form parallel ranges of mountains. The crust of the earth, in its present solid and brittle condition, is thus curved, in a greater or less degree, by the shock of every earthquake; it is well known that the trembling of the earth is produced by the progress of a wave of the solid crust; that the destruction of buildings is caused by the undulation; and that the wave has been so evident, that it has been described as producing a sickening feeling on the observer, as if the land were but thin ice heaving over water. This mode of mountain formation has been explained, when treating of the Appalachians (q. v.), which

Fig. 3.—The System of the Netherlands :

1, Silurian; 2, Coal Measures; 3, New Red Sandstone; 4, Oolite; 5, Chalk.

were thus formed. Many other ranges have had a similar origin, as some in Belgium and in the Southern Highlands of Scotland, as has been suggested by Mr Carruthers.

It is evident that in the last two classes the parallel ridges were produced at the same time. Elie de Beaumont generalised this, maintaining that all parallel ridges or fissures are synchronous; and on this he based a system of mountain-structure, which is too universal and too geometrical to be true. The synchronism of parallel fissures had been noticed by Werner, and it is now received as a first principle in mining. The converse is also held to be generally true, that fissures differing in direction differ also in age; yet divergence from a centre, and consequent want of parallelism, as in the case

of volcanoes, may be an essential characteristic of contemporaneity. Nevertheless, Elie de Beaumont classified the mountains of the world according to this parallelism, holding that the various groups are synchronous. The parallelism does not consist in having the same relations to the points of compass—for these, as regards north and south, would be far from parallel—but is estimated in relation to some imaginary great circle, which he drew round the globe would divide it into two hemispheres. Such circles he called Great Circles of Reference. But beyond this, he went a step further and proposed a more refined classification, dependent on a principle of geometrical symmetry, which he believed he had discovered among his great circles of reference. It is to be feared, however, that geometrical speculations have little foundation in nature.

**MOURNE MOUNTAINS.** See Downs, Cornwall.

**MOURNING**, a particular habit worn to express grief, especially for the decease of friends. Usages regarding mourning have varied much at different times and in different countries. Among the Jews, the duration of mourning for the dead was generally 7, but sometimes protracted to 30 days, and the external indications of sorrow consisted in weeping, tearing the clothes, smiting the breast, cutting off the hair and beard, lying on the ground, walking barefoot, and abstaining from washing, anointing themselves. Among the Greeks, the period was 30 days, except in Sparta, where it was limited to 10. The relatives of the deceased secluded themselves from the public eye, wore coarse black dress, and in ancient times cut off the hair as a sign of grief. Among the Romans, the colour of mourning for both sexes was black or dark blue under the republic. Under the empire, men wore white, black continuing to be the colour for men, who did not cut off the hair and beard as in Greece. Men wore their mourning for a few days; women a year, when for a husband or parent. The time of mourning was often shortened by a victory or other happy public event, the birth of a child, or the occurrence of a family festival. A public calamity, such as a defeat, or the death of an emperor or person of note, occasioned a public mourning, which involved a total cessation of business, called *Justitium*. In modern Europe, the ordinary colour for mourning is black; in Turkey, violet; in China, white; in Egypt, yellow; in Ethiopia, brown. It was white in Spain until 1492. Mourning is worn of different depth, and for different periods of time, according to the nearness of relationship of the deceased. On the death of a sovereign or member of the reigning house, a public mourning is ordered; and in this country, it is usual at the same time to recommend the adoption of a general mourning.

In Scotch Law, if a husband die, whether solvent or insolvent, the widow will be entitled to a pecuniary payment out of the assets for mourning suitable to his rank. And the same principle applies to mournings for such of the children as are to assist at the funeral. In England, there is no such privilege or distinction.

**MOUSE** (*Mus*), a genus of rodent mammal of the family *Muridae* (q. v.), having three sets of molar teeth in each jaw, with tuberculated incisors, the upper incisors wedge-shaped, the lower compressed and pointed, the fore-feet with five toes and a rudimentary thumb, the hind-feet five-toed; the tail long, nearly destitute of hair, and scaly. This genus includes Rats (q. v.) and the smaller species bearing the latter name.—*L.*

## MOUSE-EAR CHICKWEED—MOUTH.

COMMON M. (*M. musculus*) is perhaps not originally British, although now so abundant everywhere. It accompanies man wherever he goes, and readily colonises every region, arctic, temperate, or tropical; its great fecundity, common also to most of its congeners, causing means to be employed everywhere for the prevention of its excessive multiplication. Aristotle made the experiment of placing a pregnant female M. in a closed vessel filled with grain, and found in a short time no fewer than 120 mice in the vessel. Of cats and mouse-traps it seems unnecessary here to speak, and equally unnecessary to give a description of the common mouse. There are several varieties of this species. That generally found in houses is smaller, and not so dark in colour, as that common in barns and farmyards. A white variety sometimes occurs, and has been perpetuated in a half-domesticated state. The common brown kind is, however, at least as easily tamed, and readily becomes familiar enough. A pied variety is not uncommon in India.—Much has been written about the singing powers of the M.; it being asserted, on the one hand, that mice not unfrequently shew a strong love for music, and a power of imitating the song of birds; whilst, on the other hand, it is alleged that the singing of mice is merely the consequence of throat disease.—The M. makes a nest like that of a bird in the wainscot of a wall, among the chaff or feathers of a bed, or in any similar situation. The litter is generally from six to ten in number.—The WOOD M., or LONG-TAILED FIELD M. (*M. sylvaticus*), is a little larger than the Common Mouse. Its tail is

the ears not large. This species is not uncommon in some parts of the south of England; it is also found in the south of Scotland, although less frequently. It makes its nest among the stalks of wheat, reeds, or other grasses, weaving together the leaves and panicles of grasses, the leaves being for this purpose cut into shreds by its teeth. The nest is a very curious structure formed by mere intertwining, without cement of any kind. It is generally suspended among the stalks. It is globular, or nearly so, and entrance to it is through an opening, which almost completely closes up again.—A still smaller species of M., (*M. pumilus*) is found in the south of Europe.—An American species, the WHITE-FOOTED M. (*M. leucopus*), common in most parts of North America, and intermediate in its habits between the Common M. and the Field M., is said to depart from houses whenever either the cat or the brown rat appears in them.—The Barbary M. (*M. Barbarus*) approaches in size to the rats, and is distinguished by its longitudinally striped fur.

The name M. is often popularly given to animals considerably different from the true mice, as the *Voles* (q. v.).

**MOUSE-EAR CHICKWEED** (*Cerastium*), a genus of plants of the natural order *Caryophyllaceæ*, having five sepals, five bifid petals, ten stamens, five styles, and a capsule bursting at the top with ten teeth. The species are numerous, natives of temperate and cold countries in all parts of the world. Some of them are among the most common weeds in Britain; others, having larger flowers, are occasionally planted in flower-borders and on rock-works. The form and hairiness of the leaves of some of the British species have given rise to the popular name.

**MOUTH, DISEASES OF THE**, occur in different forms, but usually begin with inflammation of the mucous membrane. The inflammation may be equally diffused, or may be chiefly or entirely confined to the mucous follicles. When diffused, it may either present no peculiar secreted product, or the surface may be covered with a curd-like secretion, or with patches of false membrane. It may further be attended with eruption, ulceration, or gangrene, any one of which may impress a special character on the disease, or it may present peculiarities from the nature of its exciting cause, as when it accompanies scurvy, or is the result of mercurial action.

The following are the principal forms of inflammation of the mouth, or *stomatitis* (Gr. *stoma*, the mouth), as it is termed by nosologists. 1. *Common Diffused Inflammation*, which appears in reddened, somewhat elevated patches, and sometimes occupies large portions of the surface of the mouth. It is more commonly a complication of other diseases than an original affection. When of the latter character, it is generally caused by the direct action of irritants, as by scalding drinks, corrosive substances introduced into the mouth, accumulated tartar on the necks of the teeth, &c. In ordinary cases, cooling and demulcent liquids (such as cream or almond oil) applied locally, an occasional saline cathartic, with a soft and chiefly farinaceous diet, constitute the whole of the necessary treatment.

2. *Diffused Inflammation, with curd-like exudation*, is almost entirely confined to infants, and is described under its popular name of *THRUSH*.

3. *Inflammation of the Follicles, and Eruption or Vesicular Inflammation*, are described in the article *APTHÆ* (q. v.).

4. In *Ulcerative Inflammation, Cancrum Oris*, or *Canker*, an ulceration often of considerable size,

1, Harvest Mouse (*Mus messorius*); 2, Long-tailed Field Mouse (*Mus sylvaticus*).

longer; its ears are also longer; its muzzle rather longer; its under-parts lighter in colour, than in the common mouse. It is abundant throughout Britain and the temperate parts of Europe, and is a grievous pest in gardens and fields. It lays up stores of grain and other food, either in thick tufts of grass, or just under the surface of the earth. The quantity of food laid up in such stores is often wonderfully large. The Field M. is timid, gentle, and easily tamed.—The smallest British M., and the smallest British quadruped, is the HARVEST M. (*M. messorius*), of which the head and body are only 2½ inches in length, the tail being almost equally long, and to some degree prehensile; the general form elongated and slender, the head narrow,

## MOVABLES—MOZAMBIQUE CHANNEL.

with a grayish surface and an inflamed edge, appears on the gums, or inside of the cheeks or lips. The swelling of the adjacent parts is often so considerable, as to be apparent externally. There is a copious flow of saliva, and the breath is very offensive. The disease generally occurs in children from two to six years of age. The ulcer may continue for weeks, or even months, but always yields to treatment. The febrile symptoms and the constipation which are usually present, must be combated in the ordinary way. Perhaps the best general method of treating the disease is by the administration of chlorate of potash (four or five grains in sweetened water every four hours), and by frequently washing the mouth with a weak tepid solution of chlorinated soda.

5. The preceding affection is sometimes the first stage of a much more serious affection—viz., *Gangrene of the Mouth*, which usually occurs in children between the first and second dentition. A sloughing ulcer forms upon the gums, or some other part of the mouth. This slough spreads, the breath becomes extremely fetid, the disease extends to the alveolar processes, and the teeth are loosened and fall out. Inability to take food is followed by exhausting diarrhoea, and death is the usual termination. Unless taken in the early stage, when tonics and the local application of caustics may be serviceable, the disease is generally fatal.

Other affections of the mouth are noticed in the articles SALIVATION and SCURVY.

**MOVABLES**, in Scotch law, is the technical term to denote personal as contradistinguished from heritable property, one of the main distinctions of property being between these two classes. Heritage goes to the heir-at-law in case of intestacy, or what is equivalent to it, and movables go to the next of kin. See KIN. The term movables is thus not confined to corporeal things, as furniture, cattle, goods, &c., but includes debts, bills of exchange, rights of action, &c.

**MOVING PLANT** (*Desmodium gyrans*), a plant of the natural order Leguminosae, suborder Papilionaceae, a native of India, remarkable, as are also some other species of the same genus, for the spontaneous motion of the leaves. The leaves are ternate, the lateral leaflets much smaller than the terminal one. These lateral leaflets are in constant motion, being elevated by a succession of little jerks till they meet above the terminal leaflet, and then moving downwards by similar rapid jerks to the leaf-stalk. Sometimes one leaflet is in motion and the other at rest. Sometimes a few may be seen moving, whilst there is a partial cessation in the other leaves of the plant. A high wind causes this cessation more than anything else; the movements are more languid in a very hot dry day, and are to be seen in their perfection in warm moist weather. The terminal leaflet does not remain absolutely at rest, although its movements are not like those of the lateral ones, but oscillates slowly from one side to the other. Concerning these remarkable movements, nothing more than the fact that they take place can yet be said to be known.

**MOXA** is a peculiar form of counter-irritation which was early practised in the East, particularly by the Chinese and Japanese, from whom it was learned by the Portuguese. One or more small cones, formed of the downy covering of the leaves of *Artemisia Moxa* (as used by the Chinese), or of the pith of various plants (as of the common sunflower), or of linen steeped in nitre, are placed on the skin over the affected part, and the ends remote from the skin are ignited. The combustion gradually proceeds through the cone and forms a superficial

eschar on the skin. The surrounding parts must be protected by a pad of wet rag, with a hole in it for the moxa.

It may be employed with advantage in certain forms of neuralgia (especially obstinate sciatica) and paralysis, and in chronic diseases of the joints. It is not much used in consequence of its apparent severity, but the pain is not so great as might be expected, and, according to some of its advocates, is less than often attends blisters.

**MOZAMBIQUE**, a territory on the east coast of South Africa, nominally belonging to Portugal, and placed under a governor-general, although the actual possessions of Portugal consist only of a few stations, and her authority in the country is inconsiderable. It extends from Cape Delagoa in lat. 10° 41' S., to Delagoa Bay, 26° S. The chief river, the Zambesi, divides it into two portions—M. proper on the north, and Sofala on the south. Area estimated at 283,500 square miles; pop. 300,000. These figures, however, are only to be considered approximate, as the country has no definite boundary to the west. The coasts, which comprise large tracts of cultivated soil, yielding rich harvests of rice, are fringed with reefs, islands, and shoals, and between Delagoa Bay and Cape Corrientes, and from M., the principal station, to Cape Delagoa, the shores are high and steep. The forests yield valuable ornamental woods; ivory is obtained from the hippopotami that haunt the marshes; and gold and copper are found and worked. The elephant, deer, and lion inhabit the jungle; crocodiles are found in the rivers, and numerous flamingoes on the coasts. The rainy season lasts from November to March. The summer heat is very great, and the climate, which is fine in the elevated tracts, is unhealthy on the low shores and the swampy districts. Besides numerous fruits and vegetables, the grains are rice, millet, maize, and wheat. The government is in a most inefficient state, being in most places, more in the hands of native chiefs than of the Portuguese. In former times the slave-trade was carried on here extensively; and from 1846 to 1857, four governors-general were removed by their government for countenancing, if not actively engaging in it. The colony is divided into six districts, and is ruled by the governor-general and his secretary, assisted by a *junta*. Religion and education are supervised by about twelve Roman Catholic priests, but seem to be at the lowest level. Fish and turtle are caught in great quantities on the islands and reefs; pearl-fishing is a source of considerable profit; cattle, sheep, and goats are numerous, and the principal exports are gold, gold-dust, honey, tortoise-shell, cowries, gums, and amber. The Portuguese arrived here in 1497, attracted by rumours of the wealth of the country and the excellence of its ports. The principal settlements are Mozambique, Quilimane, Sena, and Tete.

**MOZAMBIQUE**, the capital of the Portuguese territory of the same name, is situated on a small coral island, on the eastern coast of Africa, close to the shore, in lat. 15° 2' S. It is defended by three forts, is well built, and contains a large square in which the palace of the governor and the custom-house are the chief buildings. Pop. 8500, of whom 7000 are slaves, 270 Christians, 102 Banyans from Hindustan, and 1150 Arabs. In former times all the markets of the world were supplied with slaves from Mozambique. Its commerce, now inconsiderable, is chiefly with India, and is carried on by Arabs.

**MOZAMBIQUE CHANNEL**, between the island of Madagascar and the south-eastern

# MOZARABIAN LITURGY—MSKET.

st of Africa, is about 1000 miles in length, about 450 in average breadth. At its northern extremity are the Comoro Islands. Over thethern portion the monsoons blow. Black whales, ding spermaceti, abound.

**MOZARABIAN LITURGY**, a liturgy—traced back by some to the apostles, but by the majority writers to St Isidore of Sevilla, who redacted in co-operation with the Fathers of the 4th council of Toledo, 633—originally in use among the Christian inhabitants of Spain (Mozarabians, Mostarabians, Mustarabians) who remained faithful to their religion after the Arabic conquest. It is also called the Gothic Liturgy, and differs in many respects from the Roman. Gregory VII. first expelled most of the Spanish churches and convents to adopt the common uniform liturgy of the Romish rite. Six Mozarabic congregations alone, chiefly in Seville and Toledo, were allowed to retain their ancient ritual, but it soon fell into disuse even among these. Archbishop Ximenes of Toledo recently founded a chapel at Toledo, in 1500, in which mass was to be said according to the Mozarabic manner, lest it might entirely fall into disuse. He further caused a number of learned men, Alfonso Ortiz among them, to collate all the extant Mozarabic liturgical MSS. to be found in different churches, chapels, and convents, and in 1517 there was edited, under his auspices, the *Missale Mistum secundum Regulam Beati Isidori cum Mozarabicum* (1500—1502), which has, however, by some unfortunate accident, remained incomplete. A whole third of the church-year is left out entirely. The peculiar affinity of this liturgy with the Gallican on the one, and the Greek on the other, makes its study extremely important for the history of the ancient Church.

**MOZART, JOHANN CHRYSOSTOM WOLFGANG AMADEUS**, one of the greatest of musical composers, born, 27th January 1756, at Salzburg, where his father was sub-director of the archiepiscopal chapel. His extraordinary musical talents were devoted to the utmost by his father. At the age of four he played the clavichord, and composed a number of minuets and other pieces still extant. At only six years of age, his performances were so remarkable, that his father took him and his sister, who possessed similar gifts, to Munich and Vienna, where they obtained every kind of encouragement from the Elector of Bavaria and the Emperor Francis I. In 1763 and 1764, the Mozart family visited Paris and London. At the age of seven, Wolfgang Mozart surprised a party of musicians, including his father, by taking part, at sight, in a concert for stringed instruments. Symphonies of his composition were produced in a public concert in London; and whilst there, he composed and published six sonatas, and made acquaintance with the works of Handel, recently deceased. Two years later, when but twelve years of age, he composed the music for the religious service, and for a trumpet part at the dedication of the Orphan House in Vienna, and conducted it in presence of the imperial court. In 1769, at the age of thirteen, he was appointed director of the Prince Archbishop of Salzburg's concerts; and in the same year travelled with his father to Italy, where he created an unheard-of enthusiasm by his performances and compositions. He composed the opera of *Idomeneo* at Milan, in October 1770, and it was first performed there in December of that year. At the age of sixteen, he was the first clavichordist in the world; he had produced two requiems and about thirty masses, numerous offertories, hymns, and cantatas, 4 operas, 2 cantatas, 13 symphonies, 24

pianoforte sonatas, not to speak of a vast number of concertos for different instruments, trios, quartets, marches, and other minor pieces. In 1779, he was appointed composer to the imperial court at Vienna, where he then fixed his residence, and there the musical works were composed upon which his great fame chiefly depends. His office in Vienna, however, was rather honorary than lucrative, and he lived by concerts, musical tours, teaching of music, and the small profits derived from the sale of his published works, till an offer of a large salary made to him by the king of Prussia led the emperor to give him 800 florins a year. His great opera of *Idomeneo* was composed in 1780, with a view to induce the family of Mademoiselle Constance Weber, afterwards his wife, to consent to the marriage, which they had declined on the ground of his reputation not being sufficiently established. This opera forms an epoch not in the composer's life only, but in the history of music. In construction, detail, instrumentation, and every imaginable respect, it was an enormous advance on all previous works of the kind, and established his reputation as the greatest musician whom the world had seen. *Die Entführung aus dem Serail* followed. His six quartets, dedicated to Haydn, appeared in 1785, and in 1786 *Le nozze di Figaro*. In 1787, he produced his *chef-d'œuvre*, *Don Giovanni*, which, though received with enthusiasm at Prague, was at first beyond the comprehension of the Viennese. *Così fan tutti* appeared in 1790. To 1791, the last year of his short life, we owe *Zauberflöte*, *La Clemenza di Tito*, and the sublime requiem composed in anticipation of death, and finished only a few days before his decease. He died on 5th December 1791, aged 35.

In the intervals of his greater works, M. composed the majority of the orchestral symphonies, quartets and quintets, which are an almost indispensable part of the programme of every concert in the present day, besides masses as familiar in England as in Catholic Europe, innumerable pianoforte concertos and sonatas, and detached vocal compositions, all of the most perfectly finished description. To Haydn M. always acknowledged his obligations; but Haydn's obligations to M. are at least as great. Haydn, though born twenty-four years earlier, survived M. eighteen years, and all his greatest works, written after M.'s death, bear manifest traces of M.'s influence. M. is the first composer in whose works all traces of the old tonality disappear; he is the father of the modern school. 'No composer has ever combined genius and learning in such perfect proportions; none has ever been able to dignify the lightest and tritest forms by such profound scholarship, or at the moment when he was drawing most largely on the resources of musical science, to appear so natural, so spontaneous, and so thoroughly at his ease.'—*Hullah*. See *Holmes' Life of Mozart* (Lond. 1845); *Otto Jahn's Life of Mozart* (Leip. 1856).

**MOZYR**, a town in the south-east of the government of Minsk, in European Russia, 150 miles south-south-east of Minsk, is situated on the left bank of the Pripyet, a tributary of the Dnieper. It is a town of considerable antiquity, and played a rather important part in the wars between the various Russian princes, previous to the Tartar invasion. It was unsuccessfully besieged by the Tartars in 1240. Under the Polish rule it was the chief town of a district, and remained so after the annexation to Russia in 1795. 150 barges and 2000 rafts are annually freighted here with goods to the amount of 500,000 rubles. Pop. (1867) 3000.

**MSKET**, also written **MTSCHEHNA**, a town in the government of Minsk, in European Russia, one of the most ancient Georgian towns.

## MTZENSK—MUCOUS MEMBRANES.

the present government of Tiflis, and about 10 miles north-north-west of the town of that name. It is said to have been the seat of the Georgian kings down to the 5th c., and contained the first Christian church of Georgia, built during the first half of the 4th century. In this church the Georgian kings were crowned and buried. The site of M. is now marked by a few huts.

**MTZENSK**, a town of Russia, in the government of Orel, 646 miles south-south-east of St Petersburg. It is situated on the Zusha, which communicates through the Oka with the Volga. The old cathedral, built on a steep rock, gives picturesqueness to the town. M. receives historical mention as far back as 1147. Its trade, chiefly with St Petersburg and Moscow, amounts in value to upwards of 1,000,000 rubles. Pop. (1867) 13,373.

**MUCILAGE**, or **BASSORIN** ( $C_{15}H_{10}O_{10}$ ), is a modification of gum which is insoluble in water, but when moistened with it, swells up into a gelatinous mass. It is contained abundantly in gum tragacanth; and many seeds, such as linseed, quince seed, &c., and certain roots, such as those of the marsh mallow, furnish it in large quantity. Alkalies render it soluble in water, and convert it into true gum; and prolonged boiling in water produces the same effect. Nitric acid converts it into mucic and oxalic acids.

**MUCOUS MEMBRANES AND MUCUS.** Under the term **MUCOUS SYSTEM**, anatomists include the skin, mucous membranes, and true glands, all of which are continuous with one another, and are essentially composed of similar parts. As the skin and the glands are described in special articles, it only remains to speak of the great internal mucous tracts. These are the alimentary mucous membrane, the respiratory mucous membrane, and the genito-urinary mucous membrane.

The *alimentary mucous membrane* commences at the lips, and not only forms the inner coat of the intestinal canal from the mouth to the anus, but gives off prolongations which after lining the ducts of the various glands (the salivary glands, the liver, and the pancreas) whose products are discharged into this canal, penetrate into the innermost recesses of these glands, and constitute their true secreting element. Besides these larger offsets, we find in the stomach and small intestine an infinite series of minute tubular prolongations, the anatomical arrangement and function of which are described in the article **DIGESTION**.

The *respiratory mucous membrane* begins at the nostrils, and under the name of *schneiderian* or *pituitary membrane*, lines the nasal cavities, from whence it sends on either side an upward prolongation through the lachrymal duct to form the *conjunctiva* of the eye; backwards, through the posterior nares (the communication between the nose and the throat), it sends a prolongation through the Eustachian tube to the middle ear (the cavity of the tympanum), and is continuous with the pharyngeal mucous membrane (which is a portion of the alimentary tract); it then, instead of passing down the œsophagus, enters and forms a lining to the larynx, trachea, and bronchial tubes to their terminations. From the continuity of these two tracts, some writers describe them as a single one, under the name of the *gastro-pulmonary tract*.

The *genito-urinary mucous membrane* commences at the genito-urinary orifices, lines the excretory passages from the generative and urinary organs, and is the essential constituent of the glands of both. See **KIDNEY**, for example.

We thus see that mucous membranes line all those passages by which internal parts communicate

with the surface, and by which matters are admitted into or eliminated from the body. In general rule, they are soft and velvety, and more or less red colour, from their great vascularity, but they present certain structural peculiarities according to the functions which they are to discharge. In all the principal parts of the mucous tracts we find the mucous membrane to present an external layer of *Epithelium* (consisting of a thin, transparent, homogeneous membrane, which from its position is termed the *epithelial membrane*, and beneath this a stratum of tissue of variable thickness, which usually presents either outgrowths in the form of papillæ or depressions or inversions in the form of follicles or glands, or both. The follicles are almost always present, but the papillæ and villi are only present in the alimentary or gastro-intestinal membrane. 'The mucous membranes,' says Carpenter, 'constitute the medium through

Diagram of the Structure of an Involved Mucous Membrane :  
Shewing the continuation of its elements in the follicles and villi :

*F, F*, two follicles; *b*, basement membrane; *e*, epithelium; *v*, villi; *n*, nerve; *v*, villi covered with epithelium; *V*, villi, whose epithelium has been shed.

nearly all the material changes are effected, take place between the living organism and external world. Thus, in the *gastro-intestinal mucous membrane* we find a provision for reducing the food by means of a solvent fluid poured from its follicles; whilst the villi, or root-like projections, which are closely set upon its surface towards its upper part, are specially adapted to absorb the nutrient materials thus reduced to liquid state. This same membrane, at its lower part, constitutes an outlet through which it discharges out not merely the indigestible residuum of food, but also the excretions from numerous glands in the intestinal wall, which result from the decomposition of the tissues, and which must be separated from them to prevent further injury. Again, the *bronchio-pulmonary*, or *respiratory mucous membrane*, serves for the introduction of oxygen from the air, and for the exhalation of carbonic acid. And, lastly, the *mucous membranes* are continuous with the cell-lined walls of the various glands, which are the elements whereby their respective products are eliminated from the blood. Although the various parts of epithelial cells discharge a special office in relation to the peculiar function of the mucous membrane upon which each kind occurs, yet they all serve one general purpose—namely, that of protecting the surfaces on which they are placed, and increasing the protecting power by the presence of

## MUDAR—MUGGLETONIANS.

secretion known as *mucus*, which ordinarily forms an extremely thin layer on these membranes, but when they are irritated or inflamed, is secreted in very considerable quantity. The exact mode of its formation is still a disputed question, but it is generally believed to be the product of the gradual solution of the uppermost epithelial cells. Besides acting both mechanically and chemically as a shield to highly sensitive membranes, it has other uses, amongst which two may be especially mentioned—1. It communicates to the salivary, and probably to other glands, properties which are not possessed either by itself or by the pure glandular secretions; and 2. It serves to eliminate a considerable quantity of nitrogen from the system. This nitrogen is contained in the *mucin*, which forms from 2·4 to 9 per cent. of nasal and bronchial mucus. This mucin contains 12·64 per cent. of nitrogen, and is the substance which gives to mucus its viscid and tenacious character. Normal mucus is devoid of smell and taste, and almost, if not quite, neutral; and hence its constant presence in the mouth gives rise to no disagreeable sensation.

**MUDAR** (*Calotropis*), a genus of shrubs of the natural order *Asclepiadaceae*, distinguished by a coronet of fine blunt processes adhering to the base of the filaments. They are natives of the East Indies, and the bark of the root, and the inspissated milky juice of some of them, are much used there as an alterative, purgative, emetic, and sudorific medicine. The medicinal properties of *M.* have been well known in India for many centuries, and have begun to attract the attention of European physicians. It is found of great value in elephantiasis, and in leprosy and other obstinate cutaneous diseases, as well as in some spasmodic affections, and in syphilis.—The species most common in the south of India is *C. gigantea*; in the north, *C. Hamiltonii*; whilst *C. procera*, said to have an extremely acrid juice, extends into Persia, and even into Syria. *M.* is very common in India, springing up in uncultivated ground, and often troublesome that which is cultivated. It is a large shrub, with stems often thicker than a man's leg; and broad fleshy leaves. It grows where almost nothing else will, on very dry sands, and rapidly attains a large size. The silky down of the pods is used for making a soft, cotton-like thread; but is short, and not easily spun. The inner bark also yields a strong and useful fibre, which makes excellent cordage and fishing-lines; but the mode of preparation hitherto used makes it costly.—The inspissated milky juice of *M.*, collected by making incisions in the bark, is used as a substitute for caoutchouc and gutta-percha. It becomes flexible when heated.—The *M.* of medicine contains a principle called *Mudarine*, on which its medicinal virtues are supposed to depend, and which possesses the rare property of gelatinising when heated, and becoming fluid when again cooled.

**MUDKI**, usually spelled **MOODKEE**, a small town of north-west Hindustan, 28 miles south-east of the Sutlej, and 70 miles south-east of the city of Lahore, on the Ravi. It has a pop. of about 6000. Here the first battle in the Sikh war of 1845–1846 was fought (18th December 1845), when the British under Sir Hugh Gough repulsed the Sikhs, and Sir Robert Henry Sale, 'Fighting Bob,' was killed.

**MU'EDDIN** (*Mu'ezzin*), the Arabic name of the Mohammedan official attached to a mosque, whose duty it is to announce the different times of prayer. His chant (*Adan*) consists of these words, repeated at intervals: 'Allah is most great. I testify that there is no God but Allah. I testify that Mohammed is the Apostle of Allah. Come to prayer.

Come to security.' ['Prayer is better than sleep' is added in the morning, at the Subh or Feghr. See **MOHAMMEDANISM**.] 'Allah is most great. There is no deity but Allah!' Besides these regular calls, two more are chanted during the night for those pious persons who wish to perform special nightly devotions. The first (*Ula*) continues, after the usual *Adan*, in this manner: 'There is no deity but Allah! He hath no companion—to Him belongeth the dominion—to Him belongeth praise. He giveth life, and causeth death. And He is living, and shall never die. In His hand is blessing, and He is almighty,' &c. The second of these night-calls (*Ebed*) takes place an hour before daybreak, and begins as follows: 'I extol the perfection of Allah, the Existing for ever and ever: the perfection of Allah, the Desired, the Existing, the Single, the Supreme,' &c. The office of a *M.* is generally intrusted to blind men only, lest they might, from their elevation, have too free a view over the surrounding terraces and harems. The harmonious and sonorous voices of the singers, together with the simplicity and solemnity of the melody, make a strikingly poetical impression upon the mind of the hearer in daytime; much more, however, is this the case whenever the sacred chant resounds from the height of the mosque through the moonlit stillness of an eastern night.

**MUFTI** (Arabic, *Expounder of the Law*). The Turkish grand Mufti is the supreme head of the Ulemas (servants of religion and laws), and has, together with the Grand Vizir (Vizir Azim), the supreme guidance of the state, nominally ruled by the sultan. His is the chief spiritual authority, and in this capacity he is also denominated Sheikh-al-Islam (Lord of the Faith). The Imams (priests), however, chosen from the body of the Ulemas, are, from the moment of their official appointment, under the authority of the Kishlar-Aga, or Chief of the Black Eunuchs. The better class of the Ulemas are the teachers and expounders of the law, from among whom the Mollahs and Cadis are elected. The Turkish laws have their basis in the Koran; the Mufti thus, as head of the judges, acquires a spiritual authority. His also is generally the office of girding the sultan with the sword at his ascension to the throne, a ceremony which takes place at the Mosque of Eyub, and which is equal to our ceremony of coronation. The Mufti is elected and may be deposed by the sultan, and his position has in modern days lost much of its former dignity and importance. His Fetwa, or decision, although attached to the imperial decrees, imparts to it but little additional weight. Nor is his own dictum in things spiritual always considered as finally binding. The only prerogative of Muftis and Ulemas which has hitherto remained untouched, is their being exempt from bodily or otherwise degrading punishments; nor can their property ever be confiscated, but descends to their successors.

**MUGGLETONIANS**, a sect that arose in England about the year 1651, and of which the founders were John Reeve, and Ludovic Muggleton (born 1607, died 1697), obscure men, but who claimed to have the spirit of prophecy. Muggleton was a journeyman tailor. He professed to be the 'mouth' of Reeve, as Aaron was of Moses. They affirmed themselves to be the two witnesses of Rev. xi. They asserted a right to curse all who opposed them, and did not hesitate to declare eternal damnation against their adversaries. They favoured the world with a number of publications, one of which—particularly directed to the Parliament and Commonwealth of England, and to His Excellency the Lord General Cromwell—was entitled a *Remonstrance from the Eternal*

## MULE-MÜLLER.

As in other hybrid animals generally, males are more numerous among mules than females; in the proportion, it is said, of two or three to one. There is no instance on record of offspring produced by two mules; but instances occur, although rarely, of their producing offspring with the horse and with the ass. The M. is very superior in size, strength, and beauty, to the hinny, the offspring of the male horse and the female ass.

**MULE.** See SPINNING.

**MULHOUSE** (Ger. *Mülhausen*), a town of Germany, in the imperial territory of Alsace-Lorraine. Pop. (1871) 52,825. M. is built on a small island between the Ill and the Rhone and Rhine Canal, and is an important station on the Strasburg and Basel line of railway. It lies in a fertile, well-watered district, and ranks as one of the most active centres of trade in Alsace; while it is also the seat of a tribunal of commerce, and of various mercantile and trade unions, which have exercised a beneficial influence on the industrial activity of the country. Its numerous manufactures produce superior woollen and fine cambric goods, excellent leather, morocco, and carpets; in addition to which, its printing and dye works for cotton, muslin, wool, and silk fabrics are almost unrivalled in regard to the delicacy of the colours, and elegance of the patterns employed. M. has extensive bleaching-works, and is noted for its cotton and woollen stocking manufactories, its breweries and distilleries, starch and straw works, and for its ironworks, in which locomotives and various forms of steam-engines are extensively manufactured. These manufactures, together with corn, wine, and brandy, form the staple articles of its very extensive trade.

M. early acquired commercial importance, having been erected into a free imperial city by Rudolph of Hapsburg in 1273. By siding with some of the Swiss cantons in the 14th c., it was enabled to maintain a certain degree of neutrality in the feuds between the empire and France. In 1523, M. adopted the Reformed faith. It remained a part of the circle of the Upper Rhine till 1798, when it was incorporated with France. It became a town of the German Empire after the war of 1870-1871.

**MULL**, after the Isle of Skye, the largest of the Inner Hebrides, belongs to the county of Argyle, and is washed on the W. and S. by the Atlantic, and bounded on the N.E. by the Sound of Mull. It is triangular in shape, hollowed on the west side by an inlet of the Atlantic, and is deeply indented by sea-lochs, of which the principal are Loch-na-Keal and Loch Screidán. Area about 237,000 statute acres, of which 12,470 are arable; pop. (1871), exclusive of the neighbouring islets, 5947. Its surface is for the most part occupied by mountains, generally rounded in outline, and rising in Ben More 3185 feet high. Of its fresh-water lakes, Loch Erisa and Loch Ba are the chief. Wood abounds in the north; but owing to the generally tame character of the mountains, the great stretches of moorland, and the absence of well-defined valleys, the scenery, with the exception of that on the coast, is uninteresting. The land under cultivation occurs chiefly on the shores and at the heads of the several lochs. The soil is unusually fertile; but the great humidity of the climate, and the frequency and violence of the gales, render it almost wholly unfit for agriculture. The land is principally laid out in stock-farms, and great numbers of cattle, sheep, and horses are reared and exported. Chief town, Tobermory (pop. 1344), in the north. The harbour of Tobermory is one of the best and safest in the Hebrides. A low-water pier was completed here in March 1864. It enables

steamers to land in any state of the tide. The Sound of Mull, 20 miles long, by 2 miles in average breadth, separates the island from the mainland of Argyleshire on the north-east.

**MÜLLER, JOHANN**, historian of Switzerland, was born 3d January 1752, at Schaffhausen, where his father was clergyman and rector of the gymnasium. He studied at Göttingen under Heyne, Schlözer, Walch, and others. In 1772, he was appointed professor of Greek at Schaffhausen, and in the same year published his first work, *Belles Cimbricum* (Zür. 1772). Already he had commenced to devote his leisure hours to the investigation of Swiss chronicles and documents. By the advice of his friend Bonstetten, he went to Geneva in 1774, where he became a private tutor; and also (1778) delivered a series of lectures on 'Universal History,' afterwards published in 24 volumes. In 1782, he was called to the Collegium Carolinum at Cassel, as professor of statistics, and a little earlier published the first volume of his great work, *Geschichte der Schweizer*. In 1786, he was appointed librarian and councillor of state to the Elector of Mainz; but he finished the 2d volume of his Swiss History; his *Darstellung des Fürstenbundes* (Leip. 1787); and *Briefe zweier Domherren* (Frankfurt, 1787). In 1792, he went to Vienna, where the Emperor Leopold gave him a situation in the privy council, and in 1800, appointed him first imperial librarian. In 1804, he left Vienna for Berlin, where he wrote *Ueber die Geschichte Friedrich's I., Ueber den Ausgang der Freiheit der Alten Völker, Versuch über die Zeitrechnungen der Vorwelt*, and an additional volume of his Swiss History. Introduced to Napoleon after the battle of Jena, he was appointed by him (1807), having been previously dismissed from the Prussian service, secretary of state in the new kingdom of Westphalia; but died at Cassel, 29th May 1809. M.'s *Sämmtliche Werke* were published, 27 vols. Stuttgart, 1810-1819; new edit. 40 vols. 1831-1835.

**MÜLLER, KARL OTFRIED**, one of the most genial, richly erudite, and industrious classical archaeologists of modern times, was born 29th August 1797, at Brieg, in Silesia. He was the son of a clergyman, and received a careful education. He studied at Breslau and Berlin. His taste for philological and archaeological studies was early developed. The first fruit of his learning was the publication of the *Aegineticorum Liber* (Berl. 1817), after which he soon received an appointment to the *Magdalenum* in Breslau, where his leisure hours were devoted to a grand attempt to analyse the whole circle of Greek myths. In 1819, he obtained an archaeological chair in Göttingen; and to thoroughly prepare himself for it, visited the collections in Germany, France, and England. His great design was to embrace the whole life of ancient Greece, its art, politics, industry, religion, in one warm and vivid conception—in a word, to cover the skeletons of antiquity with flesh, and to make the dry bones live. With this view, he lectured and wrote with a fine earnest animation, until the political troubles in Hanover made his position unworkable. He obtained permission to travel, and made tours in Greece and Italy, but unfortunately died of an intermittent fever at Athens, on 1st August 1840. M.'s literary and scholarly activity stretched over the whole field of Greek antiquity. We are indebted to him for many new and striking elucidations of the geography and topography, literature, grammar, mythology, manners and customs of the ancients. His work on the Dorians (*Die Dorer*, translated into English by Sir George Cornewall Lewis and Henry Tuffnell) forms the 2d and 3d

## MULDER—MULE.

d from time immemorial for the sake of its fruit, which are the best food for silk-worms; on account also it has been cultivated in the West of Europe since about 1540. In North America it does not succeed further north than latitude 36°, being somewhat more impatient of frost than the Black Mulberry. The perianth and stigmas are white; the fruit is almost white, and is much less fleshy than that of the Black M., although in every respect there is great difference among the

non-Mulberry (*Morus nigra*); fruit, leaf, and female flower.

varieties. A rob made of it is useful in sore

The best variety for feeding silk-worms, on account of its rapid growth and abundant leaves, is called the PHILIPPINE MULBERRY. In India, the white M. is treated as a bush, and cut down yearly; the shoots, stripped of their leaves, are thrown away, although the bark has long been used in China and Japan for making paper. It is readily from cuttings. The root has a considerable reputation as a vermifuge.—The RED MULBERRY (*M. rubra*), a native of North America, abounding especially on the lower parts of the Missouri, endures severe frosts much better than either of the others, and is therefore preferred for cultivation in the parts of Europe. Its fruit is deep red, and as pleasant as the Black Mulberry. The fruit is much more valuable; being fine-grained, and adapted even for ship-building. The tree attains a height of 60 feet or more.—The WHITE M. (*M. Indica*) has black fruit of a delicate flavour, and the leaves are extensively used for feeding silk-worms in China, Cochin-China, and India.—*M. atro-purpurea* has been introduced from China for feeding silk-worms. *M. alba*, a native of Madagascar and Mauritius; *M. difolia* and *M. corylifolia*, Peruvian species; *M. africana*, a native of Central Asia; *M. levigata*, a species most common in the north of India; *M. Cashmeriana*, a native of Cashmere, produce a small fruit. *M. dulcis*, a native of the north of Persia, is said to be superior in flavour to all others. PAPER M. (*Broussonetia papyrifera*) differs from the true mulberries in having the female flowers collected in a globular mass. The tree is of moderate size, or, in cultivation, a bush of 6–12 feet high; with leaves either simple or lobed, as in India, Japan, and the islands of the Pacific Ocean, but now not uncommon in pleasure-grounds in Europe and North America. The islanders of the Pacific cultivate the Paper M. with great

care. They make a kind of clothing from the bark, using for this purpose the bark of small branches about an inch in diameter, which they macerate in water, and then scraping off the epidermis, press and beat the moist strips together. The paper also, which is used in Japan and many parts of the East, is in great part made from the bark of the young shoots of this plant, which for this purpose is boiled to a pulp, and treated somewhat in the same way as the pulp of rags in Europe. When the shoots are cut, new ones spring up very rapidly.—Silk-worms eat the leaves of the paper mulberry.—The fruit is oblong, of a dark-scarlet colour, sweetish, but insipid.

MULDER, GERARD JOHANNES, a distinguished living chemist, was born in 1802 at Utrecht, where his father was practising as a physician. After obtaining the degree of Doctor of Medicine at the university of his native town in 1825, he commenced the practice of his profession at Amsterdam, where he was appointed to teach botany, and subsequently chemistry, in the newly-established medical school of that city. In 1841, he was elected professor of chemistry at the university of Utrecht, in consequence of the ability he had displayed in various memoirs published in the Dutch scientific journals. He is best known to the general reader as the discoverer of Proteine (q. v.), which he maintains to be the main ingredient of albumen, fibrin, casein, &c.; but the existence of which as an independent chemical compound is at the present day not generally admitted. He is the author of numerous excellent works on physiological and agricultural chemistry, on the chemistry of wine and beer, on diet and nutrition, &c., which, in consequence of their being written in Dutch, are far less known in this country than they deserve. His *Chemistry of Vegetable and Animal Physiology* has been translated into English by Dr Fromberg, and his *Chemistry of Wine* by Dr Bence Jones.

MULE (Lat. *mulus*, supposed to be connected with Gr. *molos*, labour, and with Eng. *moil*), a hybrid animal, the offspring of the male ass and the mare, much used and valued in many parts of the world as a beast of burden. The ears are long; the head, croup, and tail resemble those of the ass rather than those of the horse; but in bulk and stature the M. approaches more nearly to the horse. The M. seems to excel both the ass and the horse in intelligence; it is remarkable for its powers of muscular endurance; and its sure-footedness particularly adapts it to mountainous countries. It has been common from very ancient times in many parts of the east; and is much used also in most of the countries around the Mediterranean Sea, and in the mountainous parts of South America. Great care is bestowed on the breeding of mules in Spain and Italy, and those of particular districts are highly esteemed. In ancient times the sons of kings rode on mules, and they were yoked in chariots. They are still used to draw the carriages of Italian cardinals and other ecclesiastical dignitaries. Both in Spain and in South America, mules employed to carry burdens are driven in troops, each preceded by an animal—in South America, usually an old mare—called the *madrina*, or god-mother, to the neck of which a little bell is attached, and the mules follow with the greatest docility. When troops mingle in their halting-places or elsewhere, they are readily separated, as they recognise at once the sound of their own bell. Mules are comparatively little used in Britain, although it is alleged that work is done at less expense by the employment of mules than by the employment of horses.

and is an important station on the Strasburg and Basel line of railway. It lies in a fertile, well-watered district, and ranks as one of the most active centres of trade in Alsace; while it is also the seat of a tribunal of commerce, and of various mercantile and trade unions, which have exercised a beneficial influence on the industrial activity of the country. Its numerous manufactories produce superior woollen and fine cambric goods, excellent leather, morocco, and carpets; in addition to which, its printing and dye works for cotton, muslin, wool, and silk fabrics are almost unrivalled in regard to the delicacy of the colours, and elegance of the patterns employed. M. has extensive bleaching-works, and is noted for its cotton and woollen stocking manufactories, its breweries and distilleries, starch and straw works, and for its ironworks, in which locomotives and various forms of steam-engines are extensively manufactured. These manufactures, together with corn, wine, and brandy, form the staple articles of its very extensive trade.

M. early acquired commercial importance, having been erected into a free imperial city by Rudolph of Hapsburg in 1273. By siding with some of the Swiss cantons in the 14th c., it was enabled to maintain a certain degree of neutrality in the feuds between the empire and France. In 1523, M. adopted the Reformed faith. It remained a part of the circle of the Upper Rhine till 1798, when it was incorporated with France. It became a town of the German Empire after the war of 1870—1871.

MULL, after the Isle of Skye, the largest of the Inner Hebrides, belongs to the county of Argyle, and is washed on the W. and S. by the Atlantic, and bounded on the N.E. by the Sound of Mull. It is triangular in shape, hollowed on the west side by an inlet of the Atlantic, and is deeply indented by sea-lochs, of which the principal are Loch-na-Keal and Loch Screidan. Area about 237,000 statute acres, of which 12,470 are arable; pop. (1871), exclusive of the neighbouring islets, 5947. Its surface is for the most part occupied by mountains, generally rounded in outline, and rising in Ben More 3185 feet high. Of its fresh-water lakes, Loch Erisa and Loch Ba

where he became a private tutor; delivered a series of lectures on 'history,' afterwards published in 24 vols. he was called to the Collegium Carolinum as professor of statistics, and a little later published the first volume of his great work, *der Schweizer*. In 1786, he was appointed councillor of state to the Elector; he finished the 2d volume of his *Swiss History*, *Darstellung des Fürstenbundes* (Leipzig, 1788). In 1790, he went to Vienna, where the Emperor gave him a situation in the privy council. In 1800, appointed him first imperial councillor. In 1804, he left Vienna for Berlin, where he published *Ueber die Geschichte Friedrich's I., Ueber die Freiheit der Alten Völker, Ueber die Zeitrechnungen der Vorwelt*, and the 3d volume of his *Swiss History*. Introduced into the Prussian service, secretary of state for the kingdom of Westphalia; but died in May 1809. M.'s *Sämmtliche Werke*, 27 vols. Stuttgart, 1810—1819; new ed. 1831—1835.

MÜLLER, KARL OTFRIED, one of the most genial, richly erudite, and industrious of the modern archæologists of modern times, was born at Brieg, in Silesia, on August 1797, at Brieg, in Silesia. He was a clergyman, and received a classical education. He studied at Breslau and Berlin. His philological and archæological studies were developed. The first fruit of his labours was the publication of the *Aegineticorum Libri*, after which he soon received an appointment to the *Magdalenum* in Breslau, where he was devoted to a grand attempt to reconstruct the whole circle of Greek myths. In 1828, he was appointed an archæological chair in Göttingen, where he thoroughly prepared himself for it, visited Italy, Germany, France, and England, and his design was to embrace the whole of Greek history, its art, politics, industry, &c.

*Geschichte Hellen. Stämme und Staaten* improved ed. 3 vols. Bresl. 1844); *Ueber die Wohnsitze, Abstammung und die des Macedon. Volks* (Berl. 1825); (2 vols. Bresl. 1828); and his maps of works of the highest importance in the of ancient history and ethnology. His *Archäologie der Kunst* (Bresl. 1830, English by Leitch, London, 1850) is a work of acute original observations. *Lehrbuch zu einer wissenschaftlichen Mythologie* (Bresl. 1825) led the way to a strictly historical of the ancient myths. The work by probably best known in England is his *Literature of Ancient Greece* (London, taken at the request of the British Museum, the Diffusion of Useful Knowledge, he finished it; what he had finished into English by Sir George Cornwallis Donaldson, the latter of whom came from where it left off—at the age of 16 to the taking of Constantinople. The original was published by M.'s brother. He shewed himself also an acute critic in his editions of Varro, *De Ed.*, Festus, *De Significatione Verborum*, contributions to periodicals, encyclopedias were likewise numerous and valuable. JULIUS, brother of the preceding, born, 10th April 1801, educated at Göttingen, and Berlin, and after holding a chair, finally became a professor of theology. His best known work, *Die Christliche Sünde* (The Christian Doctrine of Sin; n. 1856), is considered by theologians as the most acute and profound treatise written on this mysterious subject.

JOHANN, one of the most eminent of the present century, was born at 14th July 1801. He began to study at 16 orders in the Roman Catholic Church. In 1819 he abandoned his theological studies, and devoted himself to medicine, and, in 1822, the degree of Doctor of Medicine at Bonn. At yet a student, he wrote for a prize *De Respiratione Fatus* (Leip. 1823). In 1824, a tutor; in 1826, an extraordinary professor of physiology at Bonn; and in 1833, succeeded professor of anatomy at Berlin. His researches were most industriously pursued and were rewarded by many discoveries, which secured for him a high reputation in the world. His works are numerous, and are occupied with particular topics in comparative anatomy. He died at Berlin, April 28, 1858. Among the most important are—*Zur vergleichenden Physiologie des Menschen und der Thiere* (Bonn, 1827); *Grundriss der Vorlesungen über die Anatomie des Menschen* (Bonn, 1829); *De Glantrientium Structura Penitiori earumque functione in Homine atque Animalibus* (Leip. 1831); *Die organischen Nerven der erectilen Geschlechtsorgane, &c.* (Berlin, 1835); and *Physiologie des Menschen* (2 vols. 4th ed. 1851), 'Manual of the Physiology of Man' has been translated into French. He was also the author of a series of dissertations on a variety of subjects connected with physiology, the most important of which have been separately published. His latest work, on infusoria, were published in 1860. He was one of the most eminent living physiologists of Germany and was trained in his school.

MÜLLER, FRIEDRICH MAX (MAXIMILIAN), one of the most eminent living orientalists, was born at Dessau, in the duchy of Anhalt-Dessau, 6th December 1823. His father, Wilhelm Müller, distinguished not only for his worth as a man, and his extensive and thorough scholarship, but as one of the first German lyric poets, was librarian of the ducal library, but died prematurely, October 1827. M. received the elements of his education at Dessau, and then went to Leipzig, where, under Professor Hermann Brockhaus, he began the study of Sanscrit. This he soon chose as his special pursuit; and the first fruits of his labours appeared in a translation of the *Hitopadesa* (Leip. 1844). In 1844, he went to Berlin to study under Bopp and Schelling, and consult the Sanscrit MSS. to be found there. In Paris, whither he repaired in 1845, he began, at the instigation of Burnouf, to prepare for an edition of the Rig-Veda, with the commentary of Sāyanācārya. With this view, he came to England, June 1846, to examine the MSS. in the East India House, London, and the Bodleian Library at Oxford; and, on the recommendation of the late Professor H. H. Wilson, the East India Company commissioned him (1847) to edit the Rig-Veda at their expense. The first volume of this great undertaking, printed at the Oxford University press, appeared in 1849; and has been followed by a second in 1853, a third in 1856, and a fourth in 1863. In 1850, M. was appointed Deputy Taylorian Professor of Modern Languages at Oxford; in 1854, succeeded to the professorship; and in 1858, was elected a Fellow of All Souls. While pursuing his labours connected with the Rig-Veda, M. has published treatises on a variety of philological topics, which have done more to awaken in England a taste for the science of language in its modern sense (see GRAMMAR) than the labours of any other single scholar. Inheriting the poetic imagination and fire of his father, M. has at command such a felicity of illustration, that subjects dry under ordinary treatment, become in his hands attractive. He has published a translation into German of Kālidāsa's *Megha-dūta* (König, 1847); *The Languages of the Seat of War in the East* (2d ed. Lond. 1855); *Comparative Mythology* (in the Oxford Essays for 1856); *History of Ancient Sanscrit Literature* (2d ed. Lond. 1860); *Lectures on The Science of Language*, delivered at the Royal Institution, London, in 1861; a second series, delivered in 1863. In 1868, he delivered the Rede lecture at Cambridge, 'On the Stratification of Languages;' and, in 1870, at the Royal Institution, London, a course of lectures 'On the Science of Religion.' *Chips from a German Workshop*, in 3 vols., were published 1868-70. He is one of the 8 foreign members of the Institute of France, and has received the degree of LL.D. from Cambridge and Edinburgh.

MULLET (*Mugil*), a genus of acanthopterous fishes, the type of the family *Mugilidae*. In this family, the body is nearly cylindrical, the scales are large; there are two widely separated dorsal fins, the first of which has only four stiff sharp spines; the teeth are extremely fine; the gullet is closed by an extraordinary development of the pharyngeal bones, so that only soft and thin food can pass down it; a branch of the stomach forms a kind of gizzard. The best known of this family belong to the genus *Mugil*, of which there are many species. They have a small mouth, with a fold or crest in the under lip, which fits into a corresponding notch in the upper one. The COMMON M., or GRAY M. (*M. capito*), is found in the Mediterranean, and along the western shores of Europe, as far as the southern and south-eastern shores of England, but becomes rare further north. The Common M. is usually about fifteen inches in length, but

in general cultivation in Egypt and neighbouring countries. The spike is compound—a distinguishing character, by which it is readily known, but which is not altogether permanent. It is occasionally cultivated in Britain, but seems more suitable to warmer regions.

**MUMPS, THE**, is a popular name of a specific inflammation of the salivary glands described by nosologists as *Cynanche Parotidæa*, or *Parotitis*. In Scotland, it is frequently termed *The Branks*.

The disorder usually begins with a feeling of stiffness about the jaws, which is followed by pains, heat, and swelling beneath the ear. The swelling begins in the parotid, but the other salivary glands (q. v.) usually soon become implicated, so that the swelling extends along the neck towards the chin, thus giving the patient a deformed and somewhat grotesque appearance. One or both sides may be affected, and, in general, the disease appears first on one side and then on the other. There is seldom much fever. The inflammation is usually at its highest point in three or four days, after which it begins to decline, suppuration of the glands scarcely ever occurring. In most cases no treatment further than antiphlogistic regimen, due attention to the bowels, and protection of the parts from cold, by the application of flannel or cotton-wool, is required, and the patient completely recovers in eight or ten days.

The disease often originates from epidemic or endemic influences, but there can be no doubt that it spreads by contagion; and, like most contagious diseases, it seldom affects the same person twice. It chiefly attacks children and young persons.

A singular circumstance connected with the disease is, that in many cases the subsidence of the swelling is immediately followed by swelling and pain in the *testes* in the male sex, and in the *mammæ* in the female. The inflammation in these glands is seldom very painful or long continued, but occasionally the inflammation is transferred from these organs to the brain, when a comparatively trifling disorder is converted into a most perilous disease.

**MÜNCHHAUSEN, HIERONYMUS KARL FRIEDRICH, BARON VON**, a member of an ancient and noble German family, who attained a remarkable celebrity by false and ridiculously exaggerated tales

Several of the adventures ascribed to him are to be found in older books, particularly *Facetiae* (Strasb. 1508); others in *Catalliano*, and Bildermann's *Utopia*, which is in Lange's *Deliciae Academicæ* (Helmst. 1627). M.'s stories still retain their popularity with the young.

**MUNDANE EGG.** In many religions, the world (Lat. *mundus*) is evolved from an egg. The product of an animal from what neither resembles in properties, seems to have been regarded as a good figure of the production of the world out of chaos. Thus, in the Egyptian and Japanese systems, the Creator is producing an egg, from which the world is produced. The same notion is found in modified forms, in the religions of many heathen nations. Sometimes a bird is represented as depositing the egg on the primeval earth. There are other modifications of this notion in the classical and other mythologies, which the inhabitants of the world, or the gods, or the powers of good and evil, are said to have produced from eggs. The egg as a symbol of creation in some mythological systems as the symbol of production or renovation, as well as of the Mundane Egg belonged to the ancient Egyptian system, and an egg is said to have been worshipped.

**MUNGO, ST.**, the popular name of St. Kentigern, one of the three great missionaries who introduced Christian faith in Scotland. St. Kentigern converted the tribes of the south; (q. v.) was the apostle of the west and the north. St. Kentigern restored or established the religion of the Welsh or British people, who lived in the country between the Clyde and the Forth, to the furthest boundaries of Cumberland and Lancashire (see *BREITIS AND SCOTS*). He is said to have been the son of a British prince, Owen ab Uall, and of a British princess, Dwywnwen or Dwywen. His daughter of Llewddyn Lueddog of Dinwiddie, Edinburgh. He was born about the year 550, and is believed to have died at Culross, on the Forth, the monastery then ruled by St. Serf, of Culross. St. Kentigern became the favourite disciple of St. Serf.

ies, and there, upon the banks of  
he founded another monastery and  
rich still bears the name of his dis-  
h. Recalled to Glasgow by a new  
or Roderick the Bountiful, Ken-  
his missionary labours, in which he  
a visit from St Columba, and dying  
501, was buried where the cathedral of

a memoir, composed at the desire of  
of Glasgow, between 1147 and 1164,  
ed by Mr Cosmo Innes in the *Regis-*  
*tus Glasguensis*. The longer life by  
rness, written about 1180, was pub-  
eriton in his *Vita Antiquae Sanctorum*  
peals to two still older lives. The  
tentigern is attested by the many  
still bear his name, as well in Scot-  
north of England. The church of  
here Southey is buried, is dedicated  
miracles which he was believed to  
were so deeply rooted in the popular  
of them sprung up again in the  
ce the legends of the Cameronian  
ers are still commemorated by the  
is of the city of Glasgow—a hazel-tree  
branches he kindled into a flame, a  
which he restored to life, a hand-bell  
ght from Rome, a salmon which rescued  
as of the Clyde the lost ring of the  
f Cadyow. Nor is it St M. only  
y survives at Glasgow; the parish  
'Enoch' commemorates his mother,  
and it is not many years since a neigh-  
bour, which still bears her name, ceased  
of occasional pilgrimage.

sanscrit title, denoting a holy sage, so a great number of distinguished persons are supposed to have acquired, by dint of more or less divine faculties.

(Ger. *München*), the capital of Bavaria, 48° 8' N. lat., and 11° 35' E. long., in a barren and flat elevated plain, at a 1700 feet above the level of the sea. The population, including the military, was, in 1871, 140,000; 90 per cent. R. Catholics, 9 per cent. Protestants, and 1 per cent. Jews). M. lies on the left bank of the Isar, and consists, in addition to the old town and suburbs, and of the three contiguous districts of Haidhausen, and Obergiesing. By the late King Ludwig, who spent nearly 40 years on the improvements of the city, M. is now decorated with buildings of almost all styles of architecture, and enriched with a valuable collection of art-treasures. The most worthy of note are: the Residenz, or city of Germany. It possesses 28 churches, of which all but two or three are Catholic. The most worthy of note are: the Frauenkirche, the see for the archbishopric of Munich, built between 1468—1494, and its two square towers, with their spiral staircases, capped by cupolas, and its highly-decorated windows; the church of St. Michael's, which contains a fine altar-piece by Thorwaldsen to Eugene Beauharnais; the Marienkirche, completed in 1767, and containing the vaults of the royal family; the church of St. Mariabühl, with its stained glass and exquisite wood-carvings; the church, or Basilica of St. Boniface, with its 64 monoliths of gray Tyrolean granite, resplendent with gold, frescoes, and mosaics of art; the cruciform-shaped Ludwigskirche, embellished with Cornelius's fresco of the Last Judgment; and lastly, the Court Chapel of Albrecht.

Saints, a perfect casket of art-treasures. Among the other numerous public buildings, a description of which would fill a volume, we can only briefly refer to a few of the more notable; as the theatre, the largest in Germany, and capable of accommodating 2400 spectators, erected in 1823; the post-office; the new palace, including the older royal residence, the treasury and chapel, antiquarian collections, &c.; and the Königsbau, designed by Klenze in imitation of the Pitti Palace, and built at a cost of 1,250,000 thalers, containing J. Schnorr's frescoes of the Nibelungen; the Banqueting Halls rich in sculpture by Schwanthaler, and in grand fresco and other paintings. In the still incomplete suburb of Maximilian are situated the old Pinakothek, or picture-gallery, erected in 1836 by Klenze, containing 300,000 engravings, 9000 drawings, a collection of Etruscan remains, &c.; and immediately opposite to it, the new Pinakothek, completed in 1853, and devoted to the works of recent artists; the Glyptothek, with its twelve galleries of ancient sculpture, and its noble collection of the works of the great modern sculptors, as Canova, Thorwaldsen, Schadow, &c. Among the gates of M., the most beautiful are the Siegesthor ('The Gate of Victory'), designed after Constantine's triumphal arch in the Forum, and the Isarthor with its elaborate frescoes. In addition to these and many other buildings intended either solely for the adornment of the city, or to serve as depositories for works of art, M. possesses numerous scientific, literary, and benevolent institutions, alike remarkable for the architectural and artistic beauty of their external appearance, and the liberal spirit which characterises their internal organisation. The library, which is enriched by the biblical treasures of numerous suppressed monasteries, contains about 800,000 volumes, of which 13,000 are incunabula, with nearly 22,000 MSS. The university, with which that of Landshut was incorporated in 1826, and now known as the Ludwig-Maximilian University, comprises 5 faculties, with a staff of 60 ordinary and 12 extraordinary professors. In 1872 the number of matriculated students attending the university was 1259. In association with it are numerous medical and other schools, a library of 160,000 vols., and various museums and cabinets. M. has an ably-conducted observatory, supplied with first-rate instruments by Fraunhofer and Reichenbach; 3 gymnasias, 4 Latin, 1 normal, various military, professional, polytechnic, and parish schools, of which the majority are Catholic; institutions for the blind, deaf and dumb, and crippled, and for female orphans, besides numerous hospitals, asylums, infant schools, &c.; an academy of sciences; royal academies of painting, sculpture, music, &c.; a botanic garden, parks, public walks, and gardens, adorned with historic, patriotic, and other monuments, and designed for the celebration of annual and other national fairs and festivals; spacious cemeteries, &c. M. is mainly indebted to the ex-king, Ludwig I., for its celebrity as a seat of the fine arts, as the greater number of the buildings, for which it is now famed, were erected between 1820 and 1850, although, since the accession of the present king, Maximilian, in 1848, the progress of the embellishments of the city has been continued on an equally liberal scale. M. is somewhat behind many lesser towns of Germany in regard to literary advancement and freedom of speculation, while its industrial activity is also inferior to its state of high artistic development. It has, however, some eminently good iron, bronze, and bell foundries, and is famed for its lithographers and engravers, and its optical, mathematical, and mechanical instrument-makers, amongst whom Utzschneider, Fraunhofer

## MUNICH—MUNICIPAL ARCHITECTURE.

and Ertl have acquired a world-wide renown. M. is noted for its enormous breweries of *Bavarian beer*; and has some good manufactories for cotton, wool, and damask goods, wax-cloth, leather, paper-hangings, carriages, pianos, gold, silver, and steel wares, &c.

The present name of this city cannot be traced further than the 12th c., when Henry the Lion raised the *Villa Munichen* from its previous obscurity, by establishing a mint within its precincts, and making it the chief emporium for the salt which was obtained from Halle and the neighbouring districts. In the 13th c., the dukes of the Wittelsbach dynasty selected M. for their residence, built the Ludwigsburg, some parts of whose original structure still exist, and surrounded the town with walls and other fortified defences. In 1327, the old town was nearly destroyed by fire, and rebuilt by the Emperor Ludwig of Bavaria very much on the plan which it still exhibits; but it was not till the

close of last century, when the fortifications were razed to the ground, that the limits of the city were enlarged to any extent. The last fifty years indeed comprise the true history of M., since that period all its finest buildings have been added to its character as a focus of artistic activity has developed, its population has been more than doubled, and its material prosperity augmented in proportionate degree.

**MUNICIPAL ARCHITECTURE**, the buildings used for municipal purposes, such as town-halls, guild-halls, &c. These were first developed when the towns of the middle ages rose in importance, and asserted their freedom. Those of Italy and Belgium were the first to move, and subsequently we find in these countries the most important specimens of municipal architecture during the middle ages. It is only in the 'free cities' of that epoch that town-halls are found. We therefore look for them in vain in France

Leather-Sellers' Hall, London.

England till the development of industry and knowledge had made the citizens of the large towns so wealthy and important as to enable them to raise the municipal power into an institution. When this became the case in the 15th and 16th centuries, we find in these countries abundant instances of buildings erected for the use of the guilds and corporations and the municipal courts. Many of these still exist along with the corporate bodies they belong to, especially in London, where the halls are frequently of great magnificence. Many of these corporation halls have recently been rebuilt by the wealthy bodies they belong to, such as the Fishmongers, Merchant Taylors, Goldsmiths, and other companies. Municipal buildings on a large scale for the use of the town councils and magistrates have also been recently erected in many of our large towns, which had quite outgrown their original modest buildings; and now no town of importance is complete without a great town-hall for the use of the inhabitants.

Municipal buildings always partake of the character of the architecture of the period when they

are erected; thus, we find in Italy that they are in the Italian-Gothic style in Como, Padua, Vicenza, Venice, Florence, &c., during the 13th, 14th, and 15th centuries. In Belgium, during the same period, they are of the northern Gothic style, and are almost the only really fine specimens of the civil architecture of the middle ages we possess. The Cloth-hall at Ypres, and the town-halls of Brussels, Louvain, Bruges, Oudenarde, &c., the Exchange at Antwerp, and many other markets, lodges, halls, &c., testify to the early importance of the municipal institutions in Belgium.

It is a curious fact, that in France, where the towns became of considerable importance during the middle ages, so few municipal buildings remain. This arises from the circumstance, that the members of the early municipalities of France were devoted to aid the bishops in the erection of the great French cathedrals, and the townspeople used these cathedrals as their halls of assembly, and even for such purposes as masques and amusements.

Of the English corporation halls, those which remain are nearly all subsequent to the 14th c.

## MUNICIPALITY, MUNICIPAL CORPORATION.

from which time to the present there are very many examples. The Guild-hall of London is one of the earliest. The present building was begun in 1411, and was built chiefly by contributions from the trades 'companies' of London. Of the town-halls recently erected, those of Manchester, Liverpool, and Leeds are amongst the most important.

**MUNICIPALITY, MUNICIPAL CORPORATION** (from Lat. *municipes*, from *munus* and *capio*, one who enjoys the rights of a free citizen), a town or city possessed of certain privileges of local self-government; the governing body in such a town. Municipal institutions originated in the times of the Roman empire. The provincial towns of Italy, which were from the first Roman colonies, as also those which, after having an independent existence, became members of the Roman state, though subjected to the rule of an imperial governor, were allowed to enjoy a right of regulating their internal affairs. A class of the inhabitants called the *curia*, or *decuriones*, elected two officers, called *duumviri*, whose functions were supposed to be analogous to those of the consuls of the imperial city, and who exercised a limited jurisdiction, civil and criminal. There was an important functionary in every municipality called the *defensor civitatis*, or advocate for the city, the protector of the citizens against arbitrary acts on the part of the imperial governor. In the later ages of the empire, the Decurions were subject to heavy burdens, not compensated by the honour of the position, which led many to endeavour to shun the office. The municipal system declined with the decline of the empire, yet it retained vitality enough to be afterwards resuscitated in union with feudalism, and with the Saxon institutions of Britain. Some cities of Italy, France, and Germany have indeed derived their present magistracy by direct succession from the days of imperial Rome, as is notably the case with Cologne. The bishop being a shield between the conquerors and the conquered, in many cases discharged the duties or obtained the functions of the *defensor civitatis*. To the north of the Alps, under the feudal system, he became officially the civil governor of the city, as the count was of the rural district. In Southern Europe, where feudalism was less vigorous, the municipalities retained a large share of freedom and self-government.

Of the cities of the middle ages, some were entirely free; they had, like the provincial towns of Italy before the extension of the Roman conquests, a constitution independent of any other powers. Venice, Genoa, Florence, Hamburg, and Lübeck, all stood in this position. Next in dignity were the free imperial cities in Germany, which, not being comprehended in the dominions of any of the princes, were in immediate dependence on the empire. Most of these cities rose into importance in the 13th c.; and their liberties and privileges were fostered by the Franconian emperors, to afford some counterpoise to the growing power of the immediate nobility. Nürnberg was especially celebrated for its stout resistance to the House of Brandenburg, and the successful war which it waged with the Franconian nobility. In England, the more important cities were immediate vassals of the crown; the smaller municipalities sometimes owned a subject superior, sometimes a greater municipality for their overlord.

Under the Anglo-Saxons, the English burghs were subject to the rule of an elective officer, called the 'Portreeve,' who exercised in burgh functions similar to those of the shire-reeve in the shire. The Norman conquerors recognised the already existing privileges of the towns by granting them charters. Instead of a shire-reeve, a viscount was placed by

the king over each shire, and a bailiff instead of the former elective officer over each burgh. In the larger towns, the bailiff was allowed to assume the Norman appellation of Mayor. The municipal franchise seems to have been vested in all the resident and trading inhabitants, who shared in the payment of the local taxes, and performance of local duties. Titles to freedom were also recognised on the grounds of birth, apprenticeship, marriage, and sometimes free gift.

In all the larger towns, the trading population came to be divided into guilds or trading companies, through membership of which companies admission was obtained to the franchise. Eventually the whole community was enrolled in one or other of the guilds, each of which had its property, its by-laws, and its common hall, and the community elected the chief officers. It was on the wealthier and more influential inhabitants that municipal offices were generally conferred; and the practice gradually gained ground of these functionaries perpetuating their authority without appealing to the popular suffrage. Contentions and disputes arose regarding the right of election, and eventually the crown threw the weight of its influence into the scale of self-elective ruling bodies. As the greater municipalities grew in strength, we find their right recognised to appear in parliament by means of representatives. The sheriffs were considered to have a discretionary power to determine which towns should, and which should not have this privilege of representation. The sovereigns of the House of Tudor and Stuart acquired the habit of extending the right of parliamentary representation to burghs not in the enjoyment of it, while at the same time, by granting or renewing to them municipal charters, they modelled the constitution of these burghs to a self-elective type, and restricted the right of voting in the choice of a representative to the governing body. During the reign of William III., Anne, and the earlier Georges, the influence of the crown was largely employed in calling new municipal corporations into existence, with the view of creating additional parliamentary support for the ministry in power. The burghs of Scotland had a history much like that of the burghs of England; their earlier charters were mere recognitions of already existing rights, and were granted to the inhabitants at large. In the course of the 14th and 15th centuries, the municipal suffrage fell gradually more and more into the hands of restricted bodies of men, until act 1469, c. 5, gave to the councils the right of appointing their successors, the old and new council together electing the office-bearers of the corporation. This state of things continued till 1833, not without much complaint. In the Scottish burghs, the several trades possessed a much more exclusive monopoly than in England. Along with the outcry for parliamentary reform arose an outcry for municipal reform; and a separate municipal reform act putting an end to the close system was passed for each part of the empire. The English act (5 and 6 Will. IV. c. 76), entitled 'An act to provide for the regulation of Municipal Corporations in England,' conferred the franchise on the owners and occupiers of property within burgh, with certain qualifications as to property, residence, &c. This constituency elected the councillors, and from the body of the councillors the mayor and aldermen were chosen. Act 32 and 33 Vict. c. 55, limited the requisite period of residence to one year's occupation, and the ballot was introduced by 35 and 36 Vict. c. 33, in municipal as in parliamentary elections. Act 3 and 4 Will. IV. made an entire change in the mode of electing councils in Scottish burghs

register in burghs not represented in parliament. An exemption, under 3 and 4 Will. IV. c. 76, of nine small burghs from the operation of the new system has been done away with. Town-councillors must be electors residing in or carrying on business in the burgh. They remain in office three years, and elect from their own number the provost and bailies. The English act of Will. IV. abolished the exclusive privileges of the guilds, but these monopolies continued in Scotland till 1839, when they were swept away by 9 and 10 Vict. c. 17. The Irish municipal system, which had been imported ready-made from England, was assimilated to the altered English system by 3 and 4 Vict. c. 108.

**MU'NIMENT-HOUSE**, a strong fire-proof apartment or building suited to contain archives, papers, and other valuables.

**MU'NJEET** (*Rubia cordifolia* or *munjista*), a species of Madder (q. v.), of which the root yields an excellent red dye. The plant differs from the common madder in its more distinctly quadrangular stem, its cordate-oblong leaves commonly in fours, and its red berries. It is a native of India, China, Japan, Central Asia, and Siberia. The root has long been used in India as affording a red dye; and is now an article of export to Europe, as a substitute for madder.

**MU'NSTER**, the largest of the four provinces of Ireland, occupies the south-west, and is bounded on the N. by Connaught, on the E. by Leinster, and on the W. and S. by the Atlantic. It contains the six counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford, and the country is described under these heads. Area, 6,064,579 statute acres. The population of the province, which in 1841 was higher than that of any of the other provinces, was shewn to be, in 1871, 1,390,402, or 439,996 less than that of Ulster, now the most populous of the provinces.

**MÜNSTER**, chief town of the district of the same name, as well as capital of all Westphalia, is situated in 51° 55' N. lat., and 7° 40' E. long., at the confluence of the Aa with the Münster Canal, 65 miles north-east of Düsseldorf. Pop., including the military, at the close of 1871, 24,815. M., which is a bishopric, and the seat of a military council, a high court of appeal, and other governmental tribunals, is one of the head-quarters of

years war, have been converted into a great attraction to the city. It is provided with institutions of charity and education. The old Catholic university of M. was founded in 1818, and its funds apportioned to various educational establishments; and the province, which comprises a Catholic theological faculty, is now the principal seat of learning. M. has a library of 50,000 volumes, a museum, and various collections of art connected with it. M. has one gymnasia, a school for female teachers, and a number of schools. The industrial products are leather, woollen fabrics, thread, starch, besides which there are good carriage-building, breweries, and distilleries. The trade of the province, the produce of the country, the principal exports are the noted Westphalian ham and sauerkraut.

M. was known under the name of *Münster* in the time of Charlemagne, who, in 785, made it as the see of the new bishop of the Saxon church. Towards the middle of the 11th c. an abbey was founded on the spot, which time derived its present name from its being a minster, or monastery. In the 12th c. it was elevated into a principality of the empire. In the 13th c. the city was incorporated in the Hanseatic League; and in 1532, it declared its adhesion to the Reformed faith, notwithstanding the violent opposition of the chapter. During the years 1535 and 1536, M. was the scene of a politico-religious movement of the people, when the excesses of these pretended reformers worked a violent reaction in the minds of the people, which had the effect of restoring the papal episcopal power; and although the citizens made good their attempted acts of rebellion, their spiritual rulers, they were finally submitted to under Bishop Christopher of St Gall, who having, in 1662, built a palace within the city, transferred the episcopal residence thither from Koesfeld, where it had been established by earlier bishops. In the 17th c. War, M. was repeatedly besieged and taken by the belligerent parties. The bishopric, since 1719 had been merged in the archbishopric of Cologne, although it retained a special government, was secularised in 1803, and among various royal houses, but it

uck, which it considerably resembles in form. The horns are remarkable, as there springs from the common base of each an additional horn, which is but an inch and a half in length; the principal one, which is simple, curved, and pointed, being about five inches in length. The female has no antlers. The male has large canine teeth or tusks,

Muntjak (*Cervus muntjak*).

also are wanting in the female.—Allied species are found in India and China.

MÜNZER, THOMAS, one of the leaders of the Anabaptists (q. v.), was born at Stolberg, in the Harz, his degree at Wittenberg as Master of Arts, and some time preached the doctrines of the Reformation in Zwickau and other places. Ere long, however, he adopted mystic views, and declaimed at what he called the 'servile, literal, and half-measures of the Reformers, requiring a radical reformation both in church and state according to his inward light.' He proclaimed an entire contempt of goods, and incited the populace to plunder the houses of the wealthy. Mühlhausen, for a time under his sway, and that of another fanatic named Pfeifer, who joined him. He took an active part in the Peasant War, and inflamed the passions of the insurgents by the wildest speeches and promises; but they were utterly defeated on 15th May 1525, after a severe conflict, at Frankenhausen, by Elector John and Duke George of Saxony, the Duke of Hesse, and the Duke of Brunswick. He was taken and carried to Mühlhausen, where he was beheaded along with Pfeifer and a number of others. He shewed no dignity or courage in the closing scenes of his life. See Strobel's *Leben und Lehren Thom. Münzer's* (Nürnberg, 1795); Mann's *Thom. Münzer* (Dresden and Leipzig, 1842); Heinrich Leo in the *Evangelische Kirchenzeitung* (1856).

MURÆNA, a genus of malacopteron fishes, of which the name Eel is commonly given, the whole of the eels being sometimes included in the family *Muranidae*. See EEL. The true *Muræna* has no fins, except the dorsal and anal, which are small and fleshy. They have one row of sharp teeth in each jaw. The head is very large, and the jaws are moved with great power. The *M. lomans*, or MURRAY (*M. helena*), abounds in the Mediterranean, and is sometimes of large size, four or five feet in length, golden yellow in front, and black towards the tail, beautifully banded and spotted. It is much thicker in proportion to its

length than any of the fresh-water eels. Its flesh is white and highly esteemed. It prefers salt-water,

Muræna (*M. helena*).

but can accommodate itself to a fresh-water pond. The ancient Romans kept and fed it in vivaria. The story of Vedius Pollio feeding his murænas with offending slaves is well known. This *M.* has been caught on the British shores, but very rarely.

Allied to the genus *M.* is the genus *Sidera*, found in the Pacific.

MURAL CROWN, in Heraldry, a crown in the form of the top of a circular tower, masoned and embattled. It is meant to represent the crown which was given by the Romans as a mark of distinction to the soldier who first mounted the walls of a besieged town, and fixed there the standard of the army. A mural crown supporting the crest, in place of a wreath, occurs in the achievements of several of the English nobility, and in various grants of arms made in the early part of the present century to officers who had distinguished themselves in the war.

Mural Crown.

Viscount Beresford, in consequence of his gallantry at the battle of Albuera, obtained as crest, issuing out of a mural crown, a dragon's head with its neck pierced through by a broken spear, the head of the spear point downwards being held in the mouth of the dragon.

MURAT, JOACHIM, king of Naples, was the son of an innkeeper at La Bastide-Fortunière, near Cahors, in France, and was born there 25th March 1767 or 1768. He was at first intended for the priesthood, and actually commenced the study of theology and canon law at Toulouse, but entered the army, and being threatened with punishment for insubordination, deserted, and after spending some time at home, proceeded to Paris, where, it is said, he was for some time a waiter at a café, but soon obtained admission into the Constitutional Guard of Louis XVI. On the outbreak of the Revolution, he was made a sub-lieutenant in a cavalry regiment. His gallantry and extreme republicanism soon won him the rank of colonel. He attached himself closely to Bonaparte, under whom he served in Italy and in Egypt, signalising himself in many battles; rose to the rank of a general of division (1799); returned with Bonaparte to France; and rendered him most important assistance on the 18th Brumaire, by dispersing the Council of Five Hundred at St Cloud. Bonaparte now intrusted him with the command of the Consular Guard, and gave him his youngest sister, Caroline, in marriage. M. commanded the cavalry at Marengo, where he greatly distinguished

which already had a council, and conferred councils on burghs which had none. A vote was given to every one who had resided six months in the burgh, or within seven miles of it, and possessed the requisite qualification to exercise the parliamentary franchise: a property qualification similar to what conferred the parliamentary franchise being required in burghs that did not send or contribute to send a member to parliament. The Municipal Elections Amendment Act (Scotland) 1868, has placed the municipal franchise in the hands of all registered voters to return a member of parliament, and in the case of burghs not represented in parliament, in the hands of all persons possessing similar property qualifications: and act 33 and 34 Vict. c. 92 has provided for the establishment of a municipal register in burghs not represented in parliament. An exemption, under 3 and 4 Will. IV. c. 76, of nine small burghs from the operation of the new system has been done away with. Town-councillors must be electors residing in or carrying on business in the burgh. They remain in office three years, and elect from their own number the provost and bailies. The English act of Will. IV. abolished the exclusive privileges of the guilds, but these monopolies continued in Scotland till 1839, when they were swept away by 9 and 10 Vict. c. 17. The Irish municipal system, which had been imported ready-made from England, was assimilated to the altered English system by 3 and 4 Vict. c. 108.

**MUNIMENT-HOUSE**, a strong fire-proof apartment or building suited to contain archives, papers, and other valuables.

**MUNJEET** (*Rubia cordifolia* or *munjista*), a species of Madder (q. v.), of which the root yields an excellent red dye. The plant differs from the common madder in its more distinctly quadrangular stem, its cordate-oblong leaves commonly in fours, and its red berries. It is a native of India, China, Japan, Central Asia, and Siberia. The root has long been used in India as affording a red dye; and is now an article of export to Europe, as a substitute for madder.

**MUNSTER**, the largest of the four provinces of Ireland, occupies the south-west, and is bounded on the N. by Connaught, on the E. by Leinster, and on the W. and S. by the Atlantic. It contains the six counties of Clare, Cork, Kerry, Limerick, Tipperary, and Waterford, and the country is described under these heads. Area, 6,064,579 statute acres. The population of the province, which in 1841 was higher than that of any of the other provinces, was shewn to be, in 1871, 1,390,402, or 439,996 less than that of Ulster, now the most populous of the provinces.

**MÜNSTER**, chief town of the district of the same name, as well as capital of all Westphalia, is situated in 51° 55' N. lat., and 7° 40' E. long., at the confluence of the Aa with the Münster Canal, 65 miles north-east of Düsseldorf. Pop., including the military, at the close of 1871, 24,815. M., which is a bishopric, and the seat of a military council, a high court of appeal, and other governmental tribunals, is one of the handsomest towns of Westphalia, retaining numerous remains of mediæval architecture, whose quaint picturesqueness is enhanced by the numerous trees and shady allées, by which the squares and streets are ornamented. Among its 14 churches, of which the majority are Catholic, the most noteworthy are the cathedral, built between the 13th and 15th centuries, and despoiled of all its internal decorations by the Anabaptists; Our Lady's Church, with its noble tower; the splendid Gothic church of St Lambert, in the market-place, finished in the 13th c., on the tower

of which may still be seen the which the bodies of the Anabaptists, Knipperdolling, and Kroppe, after they had suffered martyrdom; and the church of St. Lambert, the first bishop of M., round tower, surmounted by an eagle. The Gothic town-hall possesses in being the spot at which, in 1135, Westphalia was signed in a treaty, which has since been restored, and which of all the ambassadors who were present at the signing of the treaty. The palace, built in 1766, is a fine pleasure-grounds, including botanical gardens, connected with the palace, and these, with the ramparts, which were destroyed in the Seven Years' War, have been converted into a great attraction to the city. The old Catholic university of Münster, founded in 1527, and its funds apportioned to various educational establishments; and the library, which comprises a Catholic theological faculty, is now the principal library of 50,000 volumes, a museum, and various collections connected with it. M. has one of the best schools for female teachers, and schools. The industrial products of the city are leather, woollen fabrics, thread, besides which there are good breweries, and distilleries. The produce of the country, the most famous are the noted Westphalian ham.

M. was known under the name of Munster in the time of Charlemagne, when it was the see of the new bishop of the diocese of Münster. Towards the middle of the 12th c. an abbey was founded on the spot, which time derived its present name from the abbey, or monastery. In the 13th c. it was elevated into a principal city. In the 13th c., the city was a member of the Hanseatic League; and in 1532, when the Reformed faith, and the violent opposition of the chapter, in 1535 and 1536, M. was the scene of a politico-religious movement, when the excesses of these movements worked a violent reaction in the city, which had the effect of restoring episcopal power; and although the city had made good their attempt to restore their spiritual rulers, they were obliged to submit under Bishop C. of St Gall, who having, in 1666, been elected within the city, transferred his residence thither from Kassel. M. was established by earlier bishops, and was repeatedly the theatre of the belligerent parties. Since 1719 had been made a part of Cologne, although its government, was secular, and was shared among various royal governments, and was for a time the Congress of Vienna, the principality of Prussia, and was apportioned to the Kingdom of Hanover acquired portions of the mediæval territories of the mediæval

**MUNTJAK** (*Cervus nalis*, or *Styllocerus*), a deer abundant in Java, Siam, and the same region. It is

show, and the theatrical splendour of his equipment, which were a subject of mirth in France and Germany, rather gratified the Neapolitans. He endured with difficulty the yoke of Napoleon, which left him little but the outward show of royalty. In the expedition against Russia, he commanded the whole cavalry, but on its failure, he returned to Naples, anxious and discontented. He joined the French army again in 1813, but after the battle of Leipzig, withdrew to his own dominions, determined on breaking the French fetters with which he was bound. He concluded a treaty with Austria, and a truce with the British admiral, and promised the allies an auxiliary corps. He hesitated, however, even after his new course seemed to have been decisively adopted; and finding his position insecure after Napoleon's overthrow, he entered into private communications with him at Elba. On the Emperor's return to France, M. placed himself at the head of an army of 40,000 men, and commenced a hasty war against Austria. He was defeated at Ferrara, 12th April 1815, and again at Tolentino, 2d May. With a few horsemen he fled to Naples, where all was insurrection and commotion; thence to the island of Ischia, and found his way to France, whilst his wife and children took refuge in the British fleet. After Napoleon's final overthrow, he found refuge in Corsica, from which he proceeded in a foolhardy manner with a few followers to the coast of Naples, and proclaimed himself king and liberator, but was presently taken prisoner, and after trial by a court-martial, was shot in a hall of the castle of Pizzo, on 13th October 1815. See Léonard Gallais, *Histoire de Joachim Murat* (Paris, 1828), and Coletta, *Histoire des Six derniers mois de la Vie de Joachim Murat* (Paris, 1821). His widow assumed the title of Countess of Lipona, and resided in the neighbourhood of Trieste, where she died in 1839. His two sons went to the United States, where the elder, NAPOLÉON ACHILLE MURAT, settled in Florida, and published a number of works on the constitution and politics of his adopted country. He died 15th April 1847. The younger, NAPOLÉON LUCIEN CHARLES, married an American lady in 1827, but suffered several reverses in fortune, and Madame Murat was obliged to open a boarding-school for the support of herself and her husband.

were reserved for the capital of h whither, in 1700, he was recalled Modena, to take charge of the ce Library, and of the ducal archives siastical preferment being that of church of St Mary, at Pomposa. of his return to Modena, M. began t more exclusively to Italian histor the history of medieval Italy; and this department extended over the his life. It was not until the year first volume of his great collectio *carum Scriptores*, appeared, and the at regular intervals for nearly thir of the twenty-eight folio volumes it bearing the date of 1751. This tion, which was produced by the jo of the princes and higher nobility of a range from the 5th to the 16th all the chronicles of Italy during t illustrated with commentaries and. It was accompanied by a collection illustrative of the religious, literary, military, and commercial relations states of Italy during the period, 1738—1742, a work which, although exempt from errors, is still regarde house of medieval antiquities. W these prodigious labours, M. carrie literary correspondence with the various countries of Europe, and co not unfrequently to the principal hist ary academies, of most of which he. He was the first, moreover, to unde History of Italy from the commer vulgar era down to his own time vols. 4to, and still retains its valu reference, having been continued t to the year 1819. In his capacity the Duke of Modena, he compiled folio, the *Antiquities of the d'Este* 1740), as well as a series of historica treatises on certain territorial quest between the House of Modena an Rome. To the department of classi M.'s collection of *Inscriptions* (6 vol 1743), which, in this point of view, v

## MURCHISON—MURCIA.

vindication of himself, addressed to the learned Pope Benedict XIV., drew forth a warm and honourable testimony to the uprightness of his motives, which, without approving of the opinions to which exception had been taken, declared them free from the imputation of being contrary either to the doctrine or to the discipline of the church. Although M.'s life was essentially that of a scholar, yet his exactness in discharging the duties of a parish priest was beyond all praise, and several of the existing charitable institutions of Pomposa were founded by him. He died at Modena, January 28, 1750, in his 78th year. His works, which it would be tedious to enumerate in full detail, fill 46 volumes in folio, 34 in 4to, 13 in 8vo, and many more in 12mo. Some of these are posthumous, and were published by his nephew, G. F. Muratori, from whom we also have a life of his distinguished uncle, in 4to, printed at Omer, 1758.

MURCHISON, SIR RODERICK IMPEY, geologist and geographer, was born at Tarradale, Ross-shire, in 1792. He was educated at the Grammar-school, Durham, and having a bias for military life, next studied at the Military College, Marlow. He entered the army at an early age, and served as an officer in the 36th Regiment in Spain and Portugal. He was placed on the staff of his uncle, General Sir Alexander Mackenzie, and then obtained a captaincy in the 6th Dragoons. Quitting the army in 1816, he devoted himself to science—more especially to geology. He afterwards travelled in various parts of the globe. He found the same sedimentary strata lying in the earth's crust beneath the old red sandstone in the mountainous regions of Norway and Sweden, in the vast and distant provinces of the Russian empire, and also in America. The result of his investigations was the discovery and establishment of the Silurian system, which won for him the Copley Medal of the Royal Society, and European reputation as a geologist. His subsequent exposition of the Devonian, Permian, and Laurentian systems increased and confirmed his reputation. He explored several parts of Germany, Poland, and the Carpathians; and in 1840 he commenced a geological survey of the Russian empire, under the countenance of the imperial government. M. de Verneuil was associated with him in this great work, completed in 1845. Struck with the resemblance in geological structure between the Ural Mountains and the Australian chain, M. in his anniversary address in 1844, first predicted the discovery of gold in Australia. In 1846, six years before that metal was practically worked, he addressed a letter to the President of the Royal Geological Society of Cornwall, inciting the unemployed Cornish tin-miners to emigrate and dig for gold in Australia. He was elected President of the British Association for the Advancement of Science in 1846; President of the Royal Geographical Society in 1844 and 1845; was re-elected in 1857, and continued to hold that post till 1870, when he was compelled to resign it by a stroke of paralysis. His anniversary addresses to the geographers were of great interest and value. Perhaps no man living has done more to promote geographical science at home, and kindle the spirit of adventure among those engaged in Arctic exploration on the one hand, and African discovery on the other. In 1855, he succeeded Sir H. De la Beche in the office of Director of the Museum of Practical Geology. He was a D.C.L. of Oxford, LL.D. of Cambridge, and a Vice-president of the Royal Society. He was knighted in 1846, made K.C.B. in 1853, and a baronet in 1863. From the Emperor of Russia he received the Grand Cross of St Anne, and also that of St Stanislaus. He died 22d October

1871. The greater portion of his contributions to science have been published in the *Transactions* of the Geological and other Societies. His principal works were *The Silurian* (Lond. 1836); *The Geology of Russia in Europe and the Ural Mountains*, in 1845 (2d edition, Lond. 1853). He has also published volumes on the *Tertiary Deposits of Lower Styria*, &c. (1830), the *Geology of Cheltenham* (1834), &c.—See obituary notice of M. by Sir Henry Rawlinson in *Proceedings of the Royal Geographical Society*, vol. xvi. No. 4.

MURCHISONIA, a genus of fossil gasteropodous mollusca belonging to the family *Haliotidae*, and so named in honour of Sir R. I. Murchison. The genus consists of at least 50 species, all which are characteristic of the Palaeozoic rocks, occurring in the series from the Lower Silurian up to the Permian. The shell differs from the large genus *Pleurotomaria* only in being very much elongated. Like it, the whorls are sculptured and zoned, the aperture is channelled in front, and the outer lip is deeply notched.

MURCIA, a former province of Spain, now subdivided into the smaller provinces of Albacete and Murcia, is situated in the south-east of the peninsula. It is bounded on the N. by New Castile, on the E. by Valencia, on the S. by the Mediterranean, and on the W. by Granada, Andalusia, and New Castile. Area, 10,311 square miles. Pop. 648,652. In the north-east, the province is partly level; but in the south-west, it is composed of great valleys, high plateaus, and mountain ranges. The coast comprises stretches of desert. The principal river is the Segura, which flows through the middle of the province from west to east. On the whole, M. is not very productive, and never will be, on account of the failure of water, partly caused by the destruction of the forests. The only fertile districts are the valleys of the Segura, and the side-valleys of Lorca, Albacete, Chinchilla, and Almansa. The Esparto wastes have remained uncultivated since the banishment of the Moriscos in 1610; and the canal of M., which is intended to irrigate the arid Campo de Cartagena, is not yet finished. M. is one of the most thinly peopled districts of Spain. The north yields wheat and barley; the south, maize, fruits, wine, oil, silk, and hemp. Goats, sheep, and swine are reared in great numbers. In metals, salt, and mineral springs, M. is abundant; it has also many smelting-works for iron, lead, and copper ores, brimstone and alum. The roads, however, are in the most wretched condition, and industry in general is still in a backward state. The province was frightfully devastated by a great earthquake, 18—21 March 1829. M. was conquered by the Arabs in 711; after the fall of the califate of Cordova, it became an independent Arab kingdom, but, six years afterwards, was subjugated by King Ferdinand III. of Castile in 1241.

MURCIA (the Roman *Murgi*), a large, important, and ancient town of Spain, capital of the province of the same name, on the left bank of the Segura, and near the junction of that river with the San-gonera, 50 miles south-west of Alicante. It stands in the midst of a beautiful and luxuriantly productive *huerta* or garden, 16 miles in length, and from 7 to 8 miles wide. This *huerta* forms a portion of what is called the vale of M.; is well watered, has a bright green appearance even in winter; produces wheat, flax, pulse, and vegetables, and grows innumerable mulberry, orange, fig, and palm trees. The streets of M. are narrow but clean, and the houses are gaudily painted in pink and yellow. Its squares are filled with cypress, orange, lemon, and other southern trees. It is the see of a bishop

## MURDER—MURIDÆ

suffragan to Toledo; the cathedral is surmounted by a tower begun in 1522, completed in 1766, and crowned by a dome from which a magnificent view is obtained. The city contains few objects of fine art, a circumstance which is accounted for by the fact that, on the occasion of its siege by Sebastiani, that general, after promising that persons and property should be respected, entered the town 23d April 1810, and rifled it of its wealth and art-treasures. Silks, linens, baskets, mats, and cordage are manufactured, and oil-mills, tanneries, and other works are in operation. Pop. 80,000.

**MURDER** is the crime of killing a human being of malice aforethought, and is punishable with death. It is immaterial what means are employed to effect the object. Blackstone says that the name of murder, as a crime, was anciently applied only to the secret killing of another, which the word *moirda* signifies in the Teutonic language. And among the ancient Goths in Sweden and Denmark, the whole vill or neighbourhood was punished for the crime, if the murderer was not discovered. Murder is defined by Coke thus: 'When a person of sound memory and discretion unlawfully killeth any reasonable creature in being, and under the king's peace, with malice aforethought, either express or implied.' Almost every word in this definition has been the subject of discussion in the numerous cases that have occurred in the law-courts. The murderer must be of sound memory or discretion; i.e., he must be at least 14 years of age, and not a lunatic or idiot. The act must be done unlawfully, i.e., it must not be in self-defence, or from other justifiable cause. The person killed must be a reasonable creature, and hence killing a child in the womb is not murder, but is punishable in another way (see **INFANTICIDE**). The essential thing in murder is that it be done maliciously and deliberately; and hence, in cases of hot blood and scuffling, the offence is generally manslaughter only. Killing by duelling is thus murder, for it is deliberate. It is not necessary, in order to constitute murder, that the murderer kill the man he intended, provided he had a deliberate design to murder some one. Thus, if one shoots at A, and misses him, but kills B, this is murder, because of the previous felonious intent, which the law transfers from one to the other. So if one lays poison for A, and B, against whom the poisoner had no felonious intent, takes it, and is killed, this is murder. Formerly, in England, the Benefit of Clergy (q.v.) was allowed in cases of murder, till it was abolished by 7 and 8 Geo. IV. c. 23. The only sentence on murderers is now death, which is carried out by hanging. Formerly, the murderer was directed after death to be hung on a gibbet in chains near the place of the crime. Formerly, also, dissection was added as part of the sentence, and the execution was to take place on the day next but one after sentence. But now an interval of a fortnight usually takes place, and the body is buried in the precincts of the prison. Attempts to murder were until recently punishable in England like capital felony; but now attempts to murder are punishable only with penal servitude for life, or for not less than three years.

**MUREX**, a Linnæan genus of gasteropodous molluscs, of which has now been formed the family *Muricidæ*, belonging to the order *Pectinibranchiata* of Cuvier. The sexes are distinct; the animal has a broad foot, often much expanded; the eyes are not on stalks; the shell has a straight canal in front, often prolonged through part of a very long beak; no canal behind. The *Muricidæ* all prey on other molluscs, boring through the shells with their hard-toothed proboscis. The name **ROCK-SHELL** is often given

to many species of *M.*; and some, from the shape of the beak, are called **WOODCOCK-SHELL**. They have the shell beset with long and regularly arranged spines. The whorls of the shell are marked with ridges, or *varices*. Some species of *M.* are found on the British coasts. Species are found in all

Woodcock-Shell (*Murex tenuispina*).

the world; the largest are tropical. The ancients obtained their purple dye (see **TYRIAN PURPLE**) from species of *M.*, particularly *M. trunculus* and *M. doris*. The **VENTUS COMB** of the Indian sea is *tribulus*, a very delicate and beautiful shell with many long thin spines. Fossil *Muricidæ* are numerous, but are scarcely found in any formation older than the eocene tertiary.

**MUREXIDE**, Purpurate of Ammonia, or Purple, a curious colouring matter obtained from guano. It is similar to the purple dye or purple of the ancients, which was made from species of *Murex*—hence its name. Murexide is a product of uric acid, and as this exists in guano, and in a very free state, in guano material has been found one of the best from which to obtain it. One process used by Mr Rumney of Manchester, the chief manufacturer of this material, to produce murexide is to dissolve uric acid in dilute nitric acid, and evaporating for some time at a temperature a short of boiling, whilst still hot, to add an excess of ammonia. Two compounds are formed by this process, Alloxan and Alloxantin, and by mutual reaction on each other results in the formation of the beautiful minute green metallic-looking crystals of murexide, which, in combination with some of the compounds of lead and mercury, yield brilliant red and purple dyes. The use of murexide was becoming extensive until the discovery of aniline colours, the greater brilliancy of which checked its employment. Murexide is used in dyeing both cotton and silk goods, which, under the name of the 'Roman-purple style,' has been brought to great perfection by several large firms.

**MURIATIC ACID**. See **HYDROCHLORIC ACID**.

**MURIDÆ**, a family of rodent quadrupeds containing many genera and a very large number of species, distributed over all parts of the world, some of which rats and mice may be regarded as typical examples. To this family belong also voles, shrews, marmosets, dormice, jerboas, marmots, &c. The *Muridæ* are of the section of rodents having distinct clavicles. They have three or four molars on each side of each jaw, the molars at first furnished with rounded tubercles, which wear down till they exhibit the roughened crowns. The typical *M.*, and those nearly allied to them, have scaly tails. Marmots, dormice, jerboas, &c., have hairy tails. There is a great diversities of structure and habits among the *Muridæ*. All of them feed on vegetable food, but many of them are ready also to eat animal substances.—The limits of the family *M.* are very differently stated by different naturalists.

# MURILLO—MURRAY.

**MURILLO**, BARTHOLOMÉ ESTÉBAN, was born at Seville, and baptized Jan. 1, 1618; and after receiving some education, was placed with his relative, Juan del Castillo, to study painting. Having saved a little money, which he made by painting religious pictures for exportation to South America, he went to Madrid in 1641, being then in his 24th year, was favourably noticed by his celebrated townsman, Velasquez, and through his influence, was enabled to study the *chefs-d'œuvre* of Italian and Flemish art in the royal collections. In 1645, he determined to return to Seville, though advised to proceed to Rome by Velasquez, who offered him letters from the king. After settling in Seville, he received numerous important commissions, and was soon acknowledged as the head of the school there. In 1648, M. married a lady of fortune; he now maintained a handsome establishment, and his house was the resort of people of taste and fashion. The Academy of Seville was founded by him in 1660, but he filled the office of president only during the first year. He fell from a scaffold when painting in Cadiz on an altar-piece for the Church of the Capuchins, returned to Seville, and soon after died from the injury he received, April 3, 1682. In early life, he painted many pictures illustrative of humble life; in these, the manner was darker and less refined than that exhibited in his later pictures, which are mostly scriptural or religious pieces. In the Louvre, and in England, there are about forty of his works. Sir David Wilkie, who greatly admired and carefully studied the Spanish school, has remarked, in reference to it: 'Velasquez and Murillo are preferred, and preferred with reason, to all the others, as the most original and characteristic of their school. These two great painters are remarkable for having lived in the same time, in the same school, painted for the same people, and of the same age, and yet to have formed two styles so different and opposite, that the most unlearned can scarcely mistake them; Murillo being all softness, while Velasquez is all sparkle and vivacity.'

**MURO'M**, or **MOOROM**, a town in the south-east of the government of Vladimir, in European Russia, 70 miles east-south-east of Vladimir, and situated on the right bank of the Oka, a tributary of the Volga. Pop. (1867) 11,286. The chief industrial establishments are tanneries and sail-cloth and linen factories. The fisheries on the Oka supply the surrounding country. M. is also noted for its orchards and kitchen-gardens, the latter of which supply a great portion of Russia with cucumber-seed of the first quality. Gypsum quarries in the neighbourhood are extensively worked during winter, and their produce is transmitted by water to Moscow and St Petersburg. M. has a very picturesque appearance, and was formerly surrounded by impenetrable forests. It is frequently mentioned in the old national ballads, and is one of the most ancient towns of Russia.

**MURRAIN** is the generic term loosely used to designate a variety of diseases of domestic animals, but more correctly restricted to the vesicular epizootic, popularly known as the mouth and foot disease. It is a contagious eruptive fever, affecting cattle, sheep, pigs, and poultry; but rarely communicable to horses or men. It is characterised by the appearance of little bladders or vesicles in the mouth, on the lips, gums, and tongue; on the udder, and in the interdigital space; causing inability to eat, and drivelling of saliva, heat and swelling of the udder, and lameness. The disorder runs a fixed and definite course usually in eight or ten days. Good nursing, comfortable lodgings, and

a liberal supply of soft, easily digestible food, are the chief requisites for speedy recovery. A laxative may be given if needed. The mouth may be washed out twice daily with a mild astringent solution, which may be made with half an ounce of alum, oxide of zinc, or sugar of lead, to the quart of water. The udder in milch cows, in which the complaint is usually most serious, should be bathed with tepid water before and after milking, which must be attended to very regularly; and the feet kept clean, and washed occasionally with the lotion used for the mouth.

**MURRAY**, or **MORAY**, JAMES STEWART, EARL OF, sometimes called the 'Good Regent,' was the natural son of James V. of Scotland, by Margaret, daughter of John, fourth Lord Erskine, afterwards wife of Sir Robert Douglas of Lochleven. He was born about 1531, made Commendator of the priory of St Andrews in 1538, and subsequently of the priory of Mâcon (in France). He joined the Reformers in 1556, and almost immediately became the chief of the Protestant party in Scotland. In 1561, he was sent to France, to invite Queen Mary to return to her kingdom; and on her arrival, he became her prime minister and adviser. In February 1562, he was created Earl of Mar; but that earldom having been claimed by Lord Erskine, the title of Earl of Moray was conferred upon him instead a few months afterwards. Strongly opposed to the marriage of Mary with Lord Darnley, 29th July 1565, he endeavoured to oppose it by an appeal to arms; but he was easily put to flight by the queen, and obliged to take refuge in England. He did not return to Edinburgh till the 10th March 1566, the day after the assassination of Riccio, in which he was an accomplice. In April 1567, he went to France, but was recalled in August of the same year by the lords in arms against the queen, when he found Mary a prisoner in Lochleven, and himself appointed regent of the kingdom. After the escape of the queen, he defeated her forces, May 13, 1568, at Langside, near Glasgow, and was afterwards one of the commissioners sent to England to conduct the negotiations against her. By his prompt and vigorous measures, zeal, and prudence, he succeeded in securing the peace of the kingdom, and settling the affairs of the church, but was assassinated at Linlithgow by Hamilton of Bothwellhaugh, January 21, 1570.

**MURRAY**, JOHN, the name of three generations of English publishers, will for ever remain associated with the palmiest days of English literature in the 18th and 19th centuries. The founder of the house, John M'Murray, was born in Edinburgh about 1745. He obtained a commission in the Royal Marines in 1762, and in 1768 was still second-lieutenant, when, disgusted with the slowness of promotion, and panting for a more active career, he purchased the bookselling business of Mr Sandby, opposite St Dunstan's Church, London; and, dropping the Scottish prefix, became a bookseller and publisher at '32 Fleet Street.' He brought out the *English Review*, and published the elder Disraeli's *Curiosities of Literature*, &c. He could himself wield the pen, as some pamphlets remain to testify. He died November 16, 1793, and was succeeded in due time by his son JOHN, who was left a minor of fifteen at his father's death. One of the earliest hits of John the second was Mrs Rundell's Cookery-book, which proved to be a mine of wealth—more productive, perhaps, than *Childe Harold* itself. He became connected with Thomas Campbell and Sir Walter Scott, and in 1808—1809, projected the *Quarterly Review*, a Tory organ, in opposition to the Whig *Edinburgh Review*, then in

the height of its influence. The first number was published February 1, 1809, under the editorship of William Gifford. The new periodical was completely successful, and brought M. into communication not only with the chief literati, but also with the Conservative statesmen of the time. A still more fortunate acquaintance was that with Lord Byron, whose *Childe Harold* was published by M. in 1812. M. now removed from Fleet Street to Albemarle Street, where the business is still carried on. Here Byron and Scott first met, and here Southey made the acquaintance of Crabbe. Almost all the literary magnates of the day were 'four o'clock visitors' in Albemarle Street. Byron's pleasant verse has described the scene:

'The room's so full of wits and bards,  
Crabbes, Campbells, Crokers, Freres, and Wards.'

M.'s dinner-parties included politicians and statesmen, as well as authors, artists, and dilettanti. M. paid Byron nearly £20,000 for his works, and his dealings with Crabbe, Moore, Campbell, and Irving were princely. The second John M. died in his 65th year, in 1843, and was succeeded by his son, JOHN M. the third. Born in 1808, he was educated first at the Charter House, and afterwards at Edinburgh University. The age of Byron had gone by, when, in 1843, he succeeded to the business of his father and grandfather. A more practical and realistic age had succeeded, and the 'Home and Colonial Library,' issued to beat off foreign and American piracies, was the precursor of the cheap railway and other literature of the present day. A lively and vigorous competition, arising out of the wants of a new era, has somewhat altered the relation of the great publishing houses. That of Albemarle Street no longer ranks first in the extent and variety of its transactions, but many of the greatest works in history, biography, travel, art, and science have issued from the Albemarle Street press under the regime of the third Murray. Among his later successes may be mentioned Dr Livingstone's *Travels*, Smiles's *Life of George Stephenson*, and Charles Darwin's *Origin of Species by Natural Selection*. His handbooks of continental travel have lately been supplemented by handbooks of English counties, and these, it is understood, owe much to the personal assistance and superintendence of the present head of the famous house of Murray.

MURRAY, LINDLEY, an English grammarian, was born at Swatara, Lancaster County, Pennsylvania, U.S., in 1745. He was educated at an academy of the Society of Friends, and, on his father's removal to New York, was placed in a counting-house, from which he escaped to a school in New Jersey. He then studied law, and was admitted to the bar at the age of 21, and commenced a good practice. During the revolutionary war, he engaged in mercantile pursuits with such success as to accumulate a handsome fortune. His health failing, he came to England and purchased the estate of Holdgate, near York, where he devoted himself to literary pursuits. In 1787, he published his *Power of Religion on the Mind*, which passed through seventeen editions. His *Grammar of the English Language* was issued in 1795, and was followed by *English Exercises*, the *Key*, the *English Reader*, *Introduction and Sequel*, and a *Spelling Book*. There can be no stronger indication how entirely the systematic study of the English language was—until recent years—neglected by scholars, than the fact that M.'s Grammar was for half a century the standard text-book throughout Britain and America. M. wrote an autobiography to the year 1809, which was published after his death, February 16, 1826.

MURRAY RIVER, the principal river of South Australia. See AUSTRALIA.

MURSHEDABAD, a town of India, capital of a British district of the same name, is situated on the left bank of the Bhagratī, a branch of the Ganges, about 124 miles north of Calcutta. On the opposite side of the river stands Mahinagar, usually reckoned a part of Murshedabad. The town occupies a great space, being several miles both in length and breadth, but the buildings are for the most part of mud. It contains two palaces: the one, old and gloomy; the other, constructed after the European style, and of great beauty, was completed in 1840. Situated on the most frequented route by water from Calcutta to the North-West Provinces, the trade of M. is important. Formerly, it was the capital of Bengal, and so wealthy, that Clive compared it with London. Pop. (1871) 46,182, of whom about 60 per cent. are Hindus, and 40 per cent. Mohammedans.

MURVIEDRO, a small town of Spain, in the province of Valencia, and 18 miles north-north-east of the city of that name, on the left bank of the Palancia, and two miles from its mouth. Pop. about 5000. It stands on the site of the ancient Saguntum (q. v.).

MURZUK. See FEZZAN.

MUSACEÆ, a natural order of endogenous plants, the largest of herbaceous plants, generally destitute or almost destitute of true stems, yet resembling trees in appearance, and sometimes rivalling palms in stateliness; the long sheathing bases of the leaf-stalks combining to form a false stem. The blade of the leaf has many fine parallel veins proceeding from the midrib to the margin. The flowers are congregated on spadices, which are protected by spathes. The fruit is either a 3-valved capsule or fleshy.—The species are not numerous; they are natives of warm climates, in which they are widely distributed, and are of great value to the inhabitants of tropical countries; the fruit of some, particularly of the genus *Musa*, being much used for food, whilst the fibres of the leaves are employed for cordage and for textile purposes. See PLANTAIN, BANANA, and ABACA. A very interesting plant of the order M. is the TRAVELLER'S TREE (q. v.) of Madagascar.

MUSÆUS, JOHANN KARL AUGUST, a German writer, born in 1737 at Jena, where he studied theology, was nominated to a country church, but prevented from entering upon the cure committed to him in consequence of the opposition of the peasantry of the parish, who refused to receive him on the ground that he had been once seen to dance. In 1763, he received the appointment of tutor to the pages at the ducal court, and in 1770 he became professor at the Weimar gymnasium. His first literary production, which appeared in 1760, was a parody of Richardson's *Sir Charles Grandison*, which was at that time extravagantly admired in Germany. The success of this satirical squib was complete; but as literary fame did not bring with it a corresponding amount of pecuniary reward, M. was compelled to gain his living by other means than writing; and an interval of more than eighteen years elapsed before he found leisure to reappear as an author. In 1778, he published his *Phylogomischen Reisen*, in which he endeavoured, by a good-natured yet striking satire, to counteract the absurd uses to which the Germans of his day had turned Lavater's system. This, like his previous work, was pre-eminently successful, and encouraged by the marks of popular favour with which it was received, he laid aside his incognito, and continued to devote himself to authorship. In 1782, appeared

his charming version of German folk-lore, under the title of *Volksmärchen der Deutschen*, which professed to be merely a collection of popular tales noted down from the lips of illiterate old country people; but these tales were tintured with such a blending of genial humour, quaint fancy, and strong sense, that they have become a classical work of their kind, popular among persons of every age and class. His satirical sketches, entitled *Freund Heins Erscheinungen in Holbein's Manier* (Winterthur, 1785), maintained his reputation as one of the sprightliest and most genial satirists of his country. Under the name of Schellenberg, he began a course of tales, *Straussfedern* (Berl. 1787), which, however, he did not live to complete. He died in 1787. His *Moralische Kinderklapper* appeared the year after his death, while his other posthumous writings were edited in 1791, with an interesting notice of the author, by his relative and pupil, A. V. Kotzebue. M.'s style was at once correct and elegant, adapting itself with singular flexibility to the various subjects which he handled; while the unaffected geniality and frank loving nature which are reflected in all he wrote, have deservedly made him one of the most popular writers of his day in Germany.

MUSÆUS, one of the ancient Greek poets of the mythic period, is said to have been the son of Eumolpus and Selene; according to others, the son and pupil of Orpheus. To him was ascribed the introduction of the Eleusinian and other mysteries into Greece, and the ordering of many religious rites. He was among the ancients also the reputed author of a number of poems, oracles, purificatory verses, a war of the Titans, a theogony, hymns, &c.; but of the few verses which remain the authenticity is very doubtful.—A later MUSÆUS, who probably flourished about the end of the sixth c. of the Christian era, was the author of a very pleasing amatory poem, in Greek, entitled *Hero and Leander*, discovered in the 13th c., of which the first edition was published by Aldus Manutius about 1494, and of which there have been many subsequent editions.

MUSCÆ VOLITANTES is the term applied to ocular spectra, which appear like flies on the wing, or floating black spots before the eyes. There are two kinds of muscæ volitantes—the one a perfectly harmless kind, while the other is symptomatic of one of the most serious diseases of the eyes, viz., amaurosis.

Whoever will look through a minute pin-hole in a card at the clear sky may see floating before his sight a number of translucent tubes or fibres, and many little beads, of which some are separate, some attached to the tubes, and some apparently within them. Some of the tubes or fibres are straight, others looped or twisted, and others again forked. All these objects are bright in the middle, and bounded by fine black lines, beyond and parallel to which may be seen an appearance of coloured lines or fringes. The doublings and crossings of the loops or knots in the twisted fibres appear as black points. Though the eye be fixed, these bodies change their position with greater or less rapidity. Now, in ordinary light and vision all these objects are imperceptible, unless the knots or fibres happen to be larger than usual, when they constitute the harmless kind of muscæ volitantes. The black lines and fringes are phenomena of the inflexion or diffraction (q. v.) of light, which are never seen except in divergent rays, and all muscæ volitantes having such fringes must be situated at a greater or less distance from the retina; and there are conclusive reasons for believing that they occupy the vitreous humour, and cannot therefore portend amaurosis; whereas

those black spots which have no fringes, and which do not move, or which move only with the motions of the eye, are points in the retina which are insensible to light, and are therefore to be dreaded as symptomatic of danger to vision. To decide, then, whether the muscæ volitantes are or are not indicative of danger, the patient should fix his eye on a white surface (as a sheet of letter-paper) after a sudden shake of the head; if they sink gently downwards, they are innocent. It should perhaps be added, that though they seem to descend, they must in reality be ascending; floating up in the vitreous humour as far as the cellular partitions formed by the hyaloid membrane will permit. See EYE. For further information on the differences between the innocent and the dangerous forms of muscæ volitantes, the reader is referred to an article by Sir David Brewster in the *North British Review* for November 1856.

MUSCARDINE, or SILK-WORM ROT (*Botrytis Bassiana*), a fungus (see BOTRYTIS) which grows on silk-worms, and often kills them in great numbers. It consists of erect branching threads, with clusters of spores at the end of short lateral branches. The spores of this fungus germinate even on healthful silk-worms, and in circumstances otherwise most

Musccardine (*Botrytis Bassiana*).

favourable to their healthfulness. They germinate also on the caterpillars of other lepidopterous insects. When this pest appears among silk-worms, its progress cannot be checked by any means known. For prevention, it is most important that the silk-worms be not overcrowded.

MUSCAT, or MASKĀT, an independent Arab state, forming the sea-coast of Omān, in Eastern Arabia. It extends from the Strait of Ormus to the island of Moseirah, and nowhere exceeds 150 miles in width. The coast and interior are both sterile, but the country is studded with very fertile oases. The capital is Muscat (population, 60,000), on the Persian Gulf, a fortified town, surrounded with gardens and date-palms. It has a very good harbour, which, in the winter months, is reckoned the best refuge in the Indian Ocean, and is a most important centre of trade, where the productions of Europe, of Africa, and of the East are exchanged. The principal exports are Arabian coffee and pearls obtained from the Persian Gulf; but wheat, dates, raisins, salt, sulphur, drugs, and horses are also exported. The independence of Omān dates from 751, when the people elected a sovereign of their own. For 900 years the Imams were elected for

## MUSCATEL—MUSCLE AND MUSCULAR TISSUE.

personal merit, and afterwards from members of a ruling family. M. was taken by Albuquerque in 1507, and remained in the hands of the Portuguese till 1643, when the Arabs recovered possession of it. The Imaums afterwards made extensive conquests in Eastern Africa, including Zanzibar, Mombas, Quiloa, &c. In 1798, they acquired possession of the coasts of Laristan and Mogistan, the islands of El Kishim and Ormus, and the town of Bender Abbas in Persia, paying to the Shah a rent or tribute of 6000 tomans. The state was very prosperous under the wise and mild sway of Said Seid, the late Imaum. He ascended the throne in 1803, at the age of 16, and reigned till his death in 1856. He was long a faithful ally of England. In 1854, the Imaums were driven from their Persian dependencies, which in their opinion belonged to them in perpetuity so long as they paid the rental. They recaptured Bender Abbas, but in consequence of English interference, they were compelled to conclude a treaty with Persia in April 1856. This is said to have broken the heart of the old Seid, who died on 19th Oct. 1856. He appointed his son Majid to succeed him in Zanzibar, and his son Thuwani to succeed him in Muscat. The latter was murdered by his son Salim in 1868, who reigned for a short time, but was driven out by his uncle, Sayed Tuky. In consequence of the unsettled state of affairs in M., Persia has assumed the government of Bender Abbas and the Persian coast territory. See ZANZIBAR and WAHABIS.—See *History of the Imauns and Seyids of Omán*, by Sahib-ibn-Razik, from the Arabic, by Rev. G. P. Badger (1871); Markham's *History of Persia* (1874).

MUSCATEL (Ital. *moscado*, musk), the name given to many kinds of sweet and strong French and Italian wines, whether white or red. Amongst the finest are the white Rivesalt and red Bagnol wines from Roussillon, and the Lunel from the Pyrenees, the Lacrymæ Christi and Carigliano of Naples, &c.

MUSCATINE, a city of Iowa, U.S., is on the west bank of the Mississippi, 100 miles above Keokuk, and 32 south-east of Iowa city. It has a large trade by the river, and several railroads, three steam flour-mills, two steam saw-mills, planing-machines, &c. The export of timber amounts to 10,000,000 feet per annum. There are 16 churches, schools, newspapers, &c. Pop. (1870) 6718.

MUSCHELKALK (Ger. shell-lime), the middle member of the Triassic, or New Red Sandstone period, the beds of which are entirely absent from the British strata. Being typically developed in Germany, the foreign name has been universally adopted to designate them. They consist of (1st) a series of compact, grayish, regularly-bedded limestone, more than 300 feet thick; and (2d) alternations of limestone, dolomite, marl, gypsum, and rock-salt, nearly 300 feet thick. The limestone abounds in the remains of Mollusca. The paleozoic Goniatites are replaced by the Ceratites, a remarkable link between them and the Secondary Ammonites. Ceratites are distinguished by the few small denticulations of the inner lobes of the suture. The heads and stems of Lily encrinurites (*Encrinurus*) are also abundant in these strata, and the remains of ganoid fish have also been met with.

MUSCI. See MOSSES.

MUSCICAPIDÆ, a family of birds of the order *Insectores* and tribe *Dentirostres*, of which the greater number receive the popular name Fly-catcher (q. v.). The limits of the family are, however, very variously defined by different ornithologists. The M. are mostly inhabitants of the

warmer parts of the world, in which they are very widely diffused. The species are very numerous.

MUSCIDÆ, a family of dipterous insects, having a short, thick, membranous proboscis, geniculated at the base, entirely retractile so as to be concealed within the mouth, and terminated by two large lobes (see HOUSE-FLY); the antennæ three-jointed; the thorax with a transverse suture. The species are very numerous, and universally distributed. More than 800 are found in Britain, among which are the well-known House-fly, Blow-fly, &c. The larvæ are Maggots (q. v.). Although some of the M. are troublesome, none of them are so much so as species of some other allied families.

MUSCLE AND MUSCULAR TISSUE. Muscular tissue is specially distinguished by its contractile power, and is the instrument by which all the sensible movements of the animal body are performed. When examined under a high magnifying power, the fibres of which it is composed are found to exist under two forms, which can be distinguished from one another by the presence or absence of very close and minute transverse bars or stripes. The fibres of the *voluntary* muscles—or those whose movements can be influenced by the will—as well as the fibres of the heart, are *striped*; while those of the *involuntary* muscles—the muscular structures over which we have no control—as, for example, the muscular fibres of the intestinal canal, the uterus, and the bladder, are *unstriped*.

On examining an ordinary voluntary muscle with the naked eye (a muscle from one of the extremities of any animal, for example), we observe that it presents a fibrous appearance, and that the fibres are arranged with great regularity in the direction in which the muscle is to act or contract (for it is by their inherent power of contracting that muscles act). On closer examination, it is found that these fibres are arranged in *fasciculi*, or bundles of various sizes, enclosed in sheaths of areolar tissue, by which they are at the same time connected with and isolated from those adjoining them; and when the smallest *fasciculus*, visible to the naked eye, is examined with the microscope, it is seen to consist of a number of cylindrical fibres lying in a parallel direction, and closely bound together. These *primitive* (or, as some writers term them, the *ultimate*) fibres present two sets of markings or *striae*—viz., a longitudinal and a transverse set. The fibres, when separated from each other, frequently split longitudinally into *fibrillæ*, as is seen at one of the ends of fig. 1. Sometimes, however, when a fibre is extended,

Fig. 1.—A Fasciculus of Striped Muscular Fibres, showing longitudinal cleavage: Magnified 300 diameters.

it separates in the direction of the transverse stria into a series of discs, as is shown in fig. 2. Either cleavage is equally natural, but the latter is the least common. Hence, observes Mr Bowman, who has specially investigated the minute structure of voluntary muscle, 'it is as proper to say that the fibre is a pile of discs as that it is a bundle of fibrillæ; but, in fact, it is neither the one nor the other, but a mass in whose structure there is an

# MUSCLE AND MUSCULAR TISSUE.

intimation of the existence of both, and a tendency to cleave in the two directions. If there were a general disintegration along all the lines in both

Fig. 2.—A Fasciculus, similarly magnified, shewing transverse cleavage: The longitudinal lines are scarcely visible: a and b, discs nearly detached; b', a detached disc, more highly magnified, shewing the sarcous elements.

directions, there would result a series of particles, which may be termed *primitive particles* or *sarcous elements*, the union of which constitutes the mass of the fibre. These elementary particles are arranged and united together in the two directions, and the resulting discs, as well as fibrille, are equal to one another in size, and contain an equal number of particles. The same particles compose both. To detach an entire fibrilla is to abstract a particle of every disc, and *vice versa*. The fibres are supplied

Fig. 2 (bis).—Attachment of Tendon to Muscular Fibre in the Skate.

with vessels and nerves which lie in the intervals between them, and are attached by their extremities through the medium of tendon or aponeurosis to the parts which they are intended to move. Aggregated in parallel series, of greater or lesser size, and associated with nerves,

Fig. 3.—Transverse Sections of Striped Muscle that had been injected and dried: Magnified 70 diameters.

A, from the frog; B, from the dog; a, a, sections of the injected capillaries, shewing the position they occupy among the fibres; a', a capillary seen longitudinally; b, b, sections of elementary fibres, shewing their angular form and various size. These figures shew that the vascularity is greatest when the elementary fibres are smallest.

ing, and smallest in birds where it is most evanescent. Their average width in man is about  $\frac{1}{100}$ th of an inch, being about  $\frac{1}{12}$ d of an inch in the male and  $\frac{1}{14}$ th

of an inch in the female. The average distance between the striae, or the size of the sarcous elements, in the human subject is  $\frac{1}{100}$ th of an inch, the extremes being  $\frac{1}{10000}$ th and  $\frac{1}{1000}$ th of an inch, according to the contraction or relaxation of the fibre. The form of the fibres is polygonal, their sides being flattened against those of the adjoining fibres. Each fibre is enclosed in a transparent, very delicate, but tough and elastic tubular sheath, which cannot always be readily seen, but is distinctly shewn stretching between the separated fragments of a fibre which has been broken within it, for its

Fig. 4.—Muscular Fibre broken across: Shewing the untorn sarcolemma uniting the fragments.

toughness will often resist a force before which its brittle contents give way. This tubular sheath is known as the *sarcolemma* or *myolemma*—the former term being derived from the Greek words *sarz*, flesh, and *lemma*, a skin or husk; and the latter, from the Greek words *mūs*, a muscle, and *lemma*.

It was for a long time believed that the contraction of a muscle was associated with a change in the direction of each fibre from a straight line to a sinuous or zigzag course. The investigations of Mr Bowman have, however, shewn that this view is erroneous. He has proved that in a state of contraction there is an approximation of the transverse striae, and a general shortening with a simultaneous thickening of the fibre, but that it is never

Fig. 5.—Fragment of an Elementary Fibre (from the Eel) partially contracted in water: Magnified 300 diameters.

a, uncontracted part; b, contracted part, along the border of which the sarcolemma is raised from the surface by the water that has been absorbed, that has thereby caused the contraction, and by it has been expelled from the contractile mass.

thrown out of the straight line, except when it has ceased to contract, and its extremities are acted on by the contraction of adjacent fibres.

Muscles grow by an increase, not of the number, but of the bulk of their elementary fibres; and Mr Bowman believes that the number of fibres remains through life as it was in the fœtus, and that the spare or muscular build of the individual is determined by the mould in which his body was originally cast.

The structure of the *involuntary* or *unstriped* muscles must now be considered. This form of muscular tissue most commonly occurs in the shape of flattened bands of considerable length, but of a width not exceeding  $\frac{1}{1000}$ th or  $\frac{1}{10000}$ th of an inch. These bands are translucent, and sometimes slightly granular, and are usually marked at intervals by elongated nuclei, which become much more apparent on the addition of acetic acid. Kölliker has shewn that every one of these bands or fibres is either a single elongated cell (a fibre-cell) or is a fasciculus of such cells. (They are represented in fig. 2, d, in the

## MUSCLE AND MUSCULAR TISSUE

article CELLS, under the title of *Contractile fibre cells*.) These fibres have not usually fixed points of attachment like the striated fibres, but form continuous

Fig. 6.—Fibres of Unstriated Muscle :

a, in their natural state; b, when treated with acetic acid, which reveals the existence of corpuscles; c, corpuscles or nuclei detached. This and the preceding diagrams are copied from Bowman.

investments around cavities within the body—such as the intestinal canal, the bladder, the uterus, the blood-vessels, &c.—or are dispersed through the substance of tissues, such as the skin, to which they impart a contractile property.

The chemical composition of ordinary (or voluntary) muscle is described in the article FLESH. It is only necessary to add that the fibrille, or the sarcoous elements of which they are composed, consist of a substance termed SYNTONINE (q. v.), which closely resembles the fibrine or coagulating constituent of the blood; and that the same syntonine is also the main constituent of the unstripped muscles, or at all events of their fibre-cells. Like the blood-fibrine, it exists in a fluid form in the living tissue, and only coagulates or solidifies after death.

Our limited space prevents even an allusion to the arrangement and distribution of blood-vessels, nerves, and areolar-tissue in muscular structures; and we therefore pass on to the consideration of the muscles and their functions.

Muscles vary extremely in their form. In the limbs they are usually of considerable length, surrounding the bones and forming an important protection to the joints; while in the trunk, they are flattened and broad, and contribute very essentially to form the walls of the cavities which they enclose. There is unfortunately no definite rule regarding the nomenclature of muscles. Muscles derive their names (1) from their situation—as the temporal, pectorals, glutæals, &c.; or (2) from their direction—as the rectus, obliquus, &c., of which there may be several pairs—as, for example, rectus femoris, rectus abdominalis, rectus capitis, &c.; or (3) from their uses—as the masseter, the various flexors, extensors; or (4) from their shape—as the deltoid, trapezius, rhomboid, &c.; or (5) from the number of their divisions—as the biceps and triceps; or (6) from their points of attachment—as the sterno-cleido-mastoid, the genio-hyo-glossus, the sterno-thyroid, &c. In the description of a muscle, we express its points of attachment by the words *origin* and *insertion*; the former being applied to the more fixed point or that towards which the motion is directed, while the latter is applied to the more movable point. The

application of these terms is, however, cases arbitrary, as many muscles pull towards both attachments. Muscles whose action are termed *antagonists*, this antagonism in most cases required by the necessity for an active moving power in opposition. Thus, by one set of muscles, the *flexors* are bent; while by a contrary set, the *extensors* are straightened. One set, termed the *masseters*, closes the jaws, while another set, the *temporalis*, opens them; and probably every muscle in the body has its *antagonists* in one or more other muscles.

The skeleton, which may be termed a rigid framework, may be regarded as a lever, of which the fulcrum is, for the most part, in a joint—viz., at one extremity of the bone, the resistance (or weight) at the further extremity, and the force (or muscle) in the intermediate part. In most cases, in order to preserve the equilibrium of the body, muscles are applied to the bone at a mechanical disadvantage as regards their power; that is to say, a much larger force is employed than would suffice, if directed at right angles, to overcome the resistance. The two principal sources of this disadvantage lie in the obliquity of the muscle, and consequently of the action of the muscle, and in the muscles being usually inserted at a distance from the fulcrum. The first of these disadvantages

many cases diminished by the enlargements of the bones at the joints. (See fig. 7, A.) The tendons (*n*) of the muscles (*m*) situated above the joint are usually inserted immediately below the bony enlargement, and thus reach the bone that is to be moved (*o*) in a direction somewhat approaching the perpendicular. If this enlargement did not exist (as in fig. 7, B), the contraction of the muscle, instead of causing the bone to turn upon the upper one with but a little loss of power, would do little more than press upon the two ends of the bones to press upon each other. The second mechanical disadvantage is, therefore, partly gained by gain in the extent and velocity of movement, and by the avoidance of the great loss of power of having the muscles extended in a straight line between the ends of jointed continua. Thus the bones of the forearm (*b*, *c*) are moved by the bone of the arm (*a*) by the biceps

Fig.

Fig. 8.

which arises close to the head of the inserted at  $e$ , at a short distance from joint, which acts as the fulcrum of the this arrangement, a contraction of a  $s$  the muscle moves the hand ( $f$ ), in through the extent of about 12 inches, hand moves through every inch with

the twelfth part of the power exerted by the muscle. By the junction of two or more levers in one direction, as in the different segments of the extremities, the extent and velocity of their united actions are communicated to the extreme one. Thus a blow of the fist may be made to include the force of all the muscles engaged in extending the shoulder, elbow, and wrist.

The great and characteristic property of muscular tissue—that of shortening itself in a particular direction when stimulated—is called *contractility*. The stimulus may be direct irritation by mechanical means, or by galvanism, or by some chemical substance, but in the living body the muscular fibres are, in most cases, made to contract by the immediate influence of the nerves distributed among them, which are consequently termed *motor nerves* (see NERVOUS SYSTEM), and are under the influence of the will. By an exertion of volition, we can contract more or fewer muscles at once, and to any degree, within certain limits; and as a matter of fact, there is hardly any ordinary movement performed in which several muscles are not called in play. But every voluntary muscle is also subject to other influences more powerful in their operation than the will. The movement of the features under the impulses of passion and emotion are more or less involuntary, as is shewn by the very partial power the will has of restraining them, and the extreme difficulty of imitating them.

Many movements ensue involuntarily when certain impressions, which need not necessarily be attended with consciousness, are made on the surface of the body, or on any part of its interior, either by external or internal causes. Such movements are termed *reflex*, and are noticed in the article NERVOUS SYSTEM.

Our limited space precludes us from noticing the individual groups of muscles occurring in the human body. Several important groups are, however, noticed in the articles ARM, EYE, FOOT, HAND, LEG, &c.

MUSES, in the Classic Mythology, divinities originally included amongst the Nymphs, but afterwards regarded as quite distinct from them. To them was ascribed the power of inspiring song, and poets and musicians were therefore regarded as their pupils and favourites. They were first honoured amongst the Thracians, and as Pieria around Olympus was the original seat of that people, it came to be considered as the native country of the Muses, who were therefore called *Pierides*. In the earliest period their number was three, though Homer sometimes speaks of a single muse, and once, at least, alludes to nine. This last is the number given by Hesiod in his *Theogony*, who also mentions their names—Clio (q. v.), Euterpe (q. v.), Thaleia (q. v.), Melpomene (q. v.), Terpsichore (q. v.), Erato, Polyhymnia (q. v.), Urania (q. v.), and Calliope (q. v.). Their origin is differently given, but the most widely-spread account represented them as the daughters of Zeus and Mnemosyne. Homer speaks of them as the goddesses of song, and as dwelling on the summit of Olympus. They are also often represented as the companions of Apollo, and as singing while he played upon the lyre at the banquets of the Immortals. Various legends ascribed to them victories in musical competitions, particularly over the Sirens (q. v.). In the later classic times, particular provinces were assigned to them in connection with different departments of literature, science, and the fine arts; but the invocations addressed to them appear to have been, as in the case of modern writers, merely formal imitations of the early poets. Their worship amongst the Romans was a mere imitation of the Greeks, and never became truly national or popular. Among the places sacred to

them were the wells of Aganippe and Hippocrene on Mount Helicon, and the Castalian spring on Mount Parnassus.

MUSEUM (Gr. *mouseion*), originally the name given by the ancients to a temple of the Muses, and afterwards to a building devoted to science, learning, and the fine arts. The first museum of this kind was the celebrated Alexandrian Museum (see ACADEMY). After the revival of learning in Europe, the term museum was sometimes applied to the apartment in which any kind of philosophical apparatus was kept and used; but it has long been almost exclusively appropriated to collections of the monuments of antiquity and of other things interesting to the scholar and man of science. In this sense it began to be first used in Italy, and probably in the case of the famous Florentine Museum, founded by Cosmo de Medici, which soon became a great and most valuable collection of antiquities. Nothing analogous to the museums of modern times existed amongst the ancients, the greatest collections of statues and paintings which were made in the houses of wealthy Romans having been intended for splendour rather than for the promotion of art. The name soon ceased to be limited to collections of antiquities, and sculptures, and paintings; collections illustrative of natural history and other sciences now form a chief part of many of the treasures of the greatest museums, and there are museums devoted to particular branches of science. Of the museums of Britain, the British Museum (q. v.) is the greatest; that of Oxford, founded in 1679, is the oldest.—The museum of the Vatican, in Rome, contains immense treasures in sculptures and paintings, and also in books and manuscripts.—The museum of the Louvre in Paris, that of St Petersburg, and those of Dresden, Vienna, Munich, and Berlin, are amongst the greatest in the world. The usefulness of a museum depends not merely upon the amount of its treasures, but, perhaps, even in a greater degree upon their proper arrangement; and whilst great collections in the chief capitals of the world are of incalculable importance to science, its interests are also likely to be much promoted by those local museums, still unhappily not numerous, which are devoted to the illustration of all that belongs to particular and limited districts. Museums appropriated to the illustration of the industrial arts—their raw material, their machines, and their products—and of everything economically valuable, are of recent origin, but their importance is unquestionably very great. Pre-eminent among institutions of this kind in Britain are the South Kensington Museum and the Industrial Museum in Edinburgh.

MUSHROOM, or AGARIC (*Agaricus*), a genus of fungi, of the suborder *Hymenomycetes*, having a *hymenium* of unequal plates or gills on the lower side of the *pileus*. The species are very numerous. Many of them are poisonous, many are edible, and some are among the most esteemed fungi. The species most esteemed in Britain is the Common M. (*A. campestris*), a native also of most of the temperate regions both of the northern and of the southern hemisphere, and of which a very large and fine variety occurs in Eastern Australia. It is found during summer and autumn (but chiefly in autumn) in pastures, orchards, vineyards, &c. Its *pileus* is regularly convex, becoming almost flat when old; fleshy, dry, white with a tinge of yellow or brown; of a silky smoothness on the upper surface, or somewhat scaly, but never warty; thickly set on the under side with very unequal gills, which in a young state are pink, and afterwards become dark brown. The *pileus* is attached by its centre

# MUSHROOM.

to the top of the stem. The stem is of a firm fleshy texture, and towards the top is surrounded by a more or less distinct white membranous ring, the remains of the curtain or veil (*indusium*), which in a young state extends to the pileus, and covers the gills. This M. is gathered for the table when young, being preferred when the veil is still unbroken, and the unexpanded pileus has the form of a ball or button; but both in this state, and afterwards, whilst it shews no symptoms of decay, it is used for making Ketchup (q. v.). It has a very pleasant smell and taste, and the flesh, when bruised, assumes a reddish-brown colour.—Very similar to it, and often sold instead of it in London and elsewhere, but rejected by all skilful housekeepers as unfit even for making ketchup, is the ST GEORGE'S AGARIC (*A. Georgii*), sometimes called *whitecaps*, frequent in moist pastures and near buildings in all parts of Britain. This species is easily distinguished by its larger size—the pileus being sometimes 18 inches broad—its coarser appearance, its rather disagreeable smell, the yellow colour which its flesh assumes when bruised, and the lighter colour of its gills.—Care must be taken not to confound the Common M. with the white variety of *Agaricus phalloides*, a species not uncommon in Britain, chiefly in woods and on the borders of woods, which is very poisonous. Perhaps it is the possibility of this mistake which has led to the prohibition of the Common M. in Rome, where many kinds of esculent fungi are brought in great abundance to the market, and

This M. is used for ketchup, and is also powdered for use at table as a savoury to sauces and stews. It is constantly in market in England. It is liable, however

where a special officer superintends the sale of them. *A. phalloides* is, however, easily distinguished by the ring at the bottom of the stem, the white colour of the gills, the warts on the upper surface of the pileus, and the powerful smell, which becomes extremely disagreeable as the M. grows old.—Another species of M. much in use for the table is the FAIRY-RING M. (*A. oreades*), sometimes called *Scotch Bonnets*—the *Champignon* of the French. It is common in pastures in Britain and most parts of Europe, often forming Fairy Rings (q. v.). It is much smaller than the Common M., the pileus being seldom more than an inch broad, the stem taller in proportion. The stem is solid, fibrous, and tough, with no ring; the pileus smooth, fleshy, tough, convex, with a more or less distinct boss (*umbo*) in the centre, of a watery-brown colour; the flesh white. The odour is strong, but agreeable.

confounded with several poisonous species; only one of them, *A. dealbatus*, forms *fairy* and this may be readily distinguished by its agreeable odour, by its becoming grayish-brown zones when soaked in water, by the margin of pileus being at first rolled inwards, and by the fine dingy whitish gills.—The other edible species of M. or agaric are numerous, but they are not used on the continent of Europe, and scarcely at all in Britain, although some of them are common British plants.—The ORANGE-MILKED AGARIC (*A. deliciosus*), which grows chiefly in fir woods and among junipers, has a viscid pileus, four inches or so broad, at first orange, afterwards pale, the gills a juice orange, the gills running down the stem, the smell and taste agreeable.—The *MORCENUS* (*prunulus*) is common in woods and pastures, particularly on sandy soils. It has a pileus about 2 inches broad, convex, yellowish-white when young, the gills at first white, and afterwards flesh-coloured. The odour is agreeable. It is much esteemed on the continent as an article of food.—The PARASOL AGARIC (*A. procereus*) is found in pastures, especially under trees. It loves sandy soils. It is remarkable for its long stem, 8—12 inches high, with a thin spongy ring. The pileus is 3—7 inches broad, first obtusely conic, then bell-shaped, covered with brown scales. The taste and smell are pleasant. The WHITE FIELD AGARIC (*A. virgineus*) is one of the most common of British species, growing in pastures, with viscid or satiny white or whitish convex pileus, fully an inch broad, stem usually 1 inches long, and light chocolate-coloured gills, which run down the stem. It grows singly or in groups.—The ANISE M., or SCENTED AGARIC (*A. odoratus*), grows in shady and dells among moss and decaying leaves, with a slightly convex pileus, about three inches with pale gills. The odour is like that of anise. The IVORY M. (*A. chrysenterus*) is found in woods, with a pileus 2—3 inches broad, of a grayish-yellow broad gills, and a rather long and somewhat

tem.—The SMOKY M. (*A. fumosus*), with pileus smoke-gray above, the gills and stalk yellowish, is common in fir-woods.—All these are edible, and more or less pleasant and nutritious. Finer than most of them is the IMPERIAL M. (*A. caesarius*), the Kaiserling of the Germans, a species found in loamy soils in some parts of Europe, with orange pileus and lighter yellow stem and gills; but, unhappily, it is apt to be confounded with the very poisonous *manita* (q. v.) *muscaria*.

The COMMON M. is frequently cultivated both in the open garden and in houses or sheds. To grow in the open garden, beds are prepared, generally of earth mixed with horse-dung, partly fresh and partly from old hotbeds, and are raised into ridges almost as high as broad. To grow it in houses, boxes are filled with alternate layers of half-rotten horse-dung and of straw, with a surface layer of the mould. But of each of these methods there are many different modifications, none of which can here be detailed. In both, the production of mushrooms is sometimes left to the chance—often almost a certainty—of spawn (*mycelium*) or spores existing in the dung or earth; sometimes, to increase the probability of a speedy and abundant crop, earth is introduced into the bed or box from a pasture known to be rich in mushrooms, and M. spawn is also frequently planted, which is either collected where mushrooms grow, or produced by artificial means, often appearing and being propagated extensively without the development of the M. itself. The almost certain production of M. spawn in heaps of slightly-fermenting horse-dung, straw, and earth, has been often urged as an argument in favour of the equivocal generation of fungi, but the minuteness and multitude of the spores may more reasonably be urged on the opposite side.

**MUSIC** (Gr. *mousike*, from *mousa*, muse; Lat. *musica*), a combination or succession of sounds having the property of *pitch*, so arranged as to please the ear. The pleasure derived from music arises from its exciting agreeable sensations, and raising pleasing mental images and emotions. Apart from words, it expresses passion and sentiment, and linked to words, it loses its vagueness, and becomes a beautiful illustration of language.

The doctrine of musical sounds is based on the principles of Acoustics (q. v.). Sound is conveyed through elastic media by waves, not of alternate elevation and depression, but of alternate condensation and rarefaction, in which it is the form, the condition of the groups of particles that progresses, not each individual particle. When a series of vibrations recur on the ear at precisely equal intervals of time, following each other so closely that each cannot be separately distinguished, the result is a musical sound or note. The sound ceases to have a musical character when each pulsation is individually audible, as is the case when there are fewer than about sixteen beats in a second. The gravity or sharpness of the sound is called its *pitch*, and depends on the number of vibrations in a given time. A succession or progression of musical sounds following each other constitutes melody; the difference in pitch between any two of them is called an interval. Where two or more musical sounds, whose relative pitch are properly proportioned, are heard simultaneously, the result is a chord, and a succession of chords constitutes harmony.

When a vibration is communicated to a string stretched between two points, the result is a musical note, whose pitch is dependent on the length of the string and the degree of tension applied to it: the shorter the string, and the greater the tension, the higher is the pitch. If the string be divided in

the middle, the tension remaining the same, the note produced is twice as high in pitch, and is called the octave to the note produced by the whole string. Every vibration of the one corresponds to two of the other, and there is between a note and its octave a far closer relation than between any two other notes; they go together almost as one sound, and are considered to a great extent as one musical sound. In the diatonic scale, familiar to every correct ear, there are six notes, bearing certain harmonic relations to the fundamental note, interposed between it and its octave; and as we ascend, the notes arrange themselves in similar successions of sevens, each set an octave higher, or double the pitch of that which preceded it. The seven notes are designated by the names of the first seven letters of the alphabet, the same letter being used for any note and its octave. For another notation also in use, see SOLMIZATION. Taking C for the fundamental note, we have for our scale

C D E F G A B C D E F G A B C, &c.

The scale may be extended up or down indefinitely, so long as the sounds obtained continue to be musical. The satisfaction and sense of completeness which the diatonic scale gives the ear, arise from its being founded on correct harmonic principles. The quality called harmony is produced by a coincidence of vibrations: notes are more harmonious the oftener their waves coincide. Besides the octave, two of whose waves coincide with one of the fundamental, there are other intervals harmonious, though in a less degree. Dividing our string into three parts instead of two, we have a note higher than the octave, which may be lowered by an octave by making the string two-thirds of the original length, and produces a wave of which three coincide with two of the fundamental. Next to the octave, this note stands in the most intimate relation to the fundamental; it is called the dominant. Dividing the string by five, and lowering the note two octaves, another harmonic is got, called the mediant. In contradistinction from both these, the fundamental note (or any of its octaves) is called the tonic or key-note. C being taken as the key-note, E is the mediant, and G the dominant. These three notes, when struck simultaneously, form the harmonic triad, and stand to each other in the relation of 1,  $\frac{2}{3}$ ,  $\frac{3}{2}$  (numbers indicating the number of vibrations, which are inversely as the length of the string), or, reducing fractions to integers, in the relation of 4, 5, 6. When a musical string is vibrating, these sounds are heard on close observation more or less distinctly vibrating along with it, the cause being a spontaneous division of the string into aliquot parts, producing subordinate vibrations simultaneously with the principal vibrations. But the dominant may in its turn be the tonic from which another triad of tonic, mediant, and dominant is taken, forming a scale of triads extending indefinitely up and down, and it is from three such adjacent triads that the diatonic scale originates. Its elements are the triad of the tonic united with the triads which stand in the most intimate relation to it—viz., those immediately above and below it—

F A C, C E G, G B D.

F is the note whose dominant is C (the tonic), and therefore, in respect of C, it is called the subdominant. A is the mediant of the subdominant F, and therefore called the submediant. D is the dominant of the dominant, and is called the super-tonic. B, the mediant of the dominant, is called the leading note. We have seen that the notes of each triad stand to each other in the relation of 4, 5, 6.

# MUSIC.

Preserving this proportion, and multiplying to avoid fractions, we have

F A C E G B D  
as 16, 20, 24, 30, 36, 45, 54

We must multiply F and A by 2, and divide D by 2, to bring them within the compass of an octave, and then we have

C D E F G A B C  
as 24, 27, 30, 32, 36, 40, 45, 48

These are the degrees of the Diatonic Scale, which are indicated by the white keys of the pianoforte, as in the figure in the following column.

The interval CD is commonly called a second; CE, a third; CF, a fourth; CG, a fifth; CA, a sixth; and CB, a seventh; CC being, as already seen, an eighth or octave—names corresponding to the position of the notes on the key-board or in the diatonic scale, but having no relation to the proper proportional numbers already given. The intervals of the third, fifth, and sixth (counting from the key-note), owing to the more intimate harmonic relation of the notes between which they lie, afford more satisfaction to the ear than the others, or are, as it is called, the most perfectly consonant intervals. Intervals may be counted from any note as well as the tonic. DF is called a third as well as CE, although these intervals are unequal. We may have intervals beyond the octave; they are, however, substantially but repetitions of those below, CD, a ninth, being also a second, and so on.

It is often desirable in the course of a musical composition to change the key-note, which involves the formation of a diatonic scale on some other note than C, in which case we are said to modulate from one key into another. As the intervals CD, DE, EF, &c., are by no means all equal, the notes which we have already got will not do for a scale founded on any other tonic than C. The ratios of the intervals in the diatonic scale, expressed in numbers by logarithms, are:

C	D	E	F	G	A	B	C
51	46	28	51	46	51	28	

At first sight it would appear that in keyed instruments there must be a separate row of keys for each tonic, but practically this is found not to be necessary. If D instead of C be taken as key-note, E, G, and A are some approach to the correct second, fourth, and fifth, but F and C are greatly too low in pitch for a proper third and seventh. With some notes taken as key-note, the correspondence is greater, with others it is less. The difficulty is overcome by a system of compromises called

Temperament (q. v.). Roughly speaking, we have in the diatonic scale an alternation of two long intervals, a short interval, three long intervals and a short interval. The long intervals 51 and 46 are styled tones, and the short interval 28 a semitone. Were the tones all equal, and the semitone exactly half a tone, a note interposed in the middle of each tone, dividing the seven intervals into twelve, would make it immaterial where the scale began. A system founded on this supposition is the remedy actually adopted in most keyed instruments, and the inaccuracy produced by this compromise is not sufficiently great to offend

the ear. The interposed notes, indicated by the black keys of the pianoforte (see fig.), complete what is called the chromatic scale, consisting of twelve intervals approximately equal.

The notes of music are represented in ordinary notation on a series of five parallel lines, called the staff. On these lines, and in the four spaces between them, marks are placed indicating the notes, which are counted upwards, beginning with the lowest line. Every line or space is called a degree, the staff consisting of nine degrees.

When more than nine notes are required, the spaces below and above the staff are used, and the scale is extended by means of short added lines, called ledger lines. The pitch of the notes on the scale is determined by a figure called a clef (*clavis*, a key), placed at the beginning of the staff on a particular note, from which all the others are counted. The clef most in use are the bass, tenor, and treble clefs represented on the notes F, C, and G respectively (see CLEF). The treble and bass clefs only are used in music for keyed instruments, and when a staff is required for each hand, they are joined together by a brace, the upper staff for the right hand, the lower for the left. The ascending scale in these clefs is as follows:

These notes correspond with the white keys of the pianoforte or the diatonic scale when C is key-note, no allowance being made for the black keys, which, as we have seen, divide the tones into semitones. Those semitones which do not occur with C as key-note are represented by the signs # (sharp) and b (flat). The sign # prefixed to a note,
